Energy Research Abstracts

Abstracts 6098–8450

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction for the Department of Energy's scientific and technical information (STI) program and maintains a centralized base of support to assist Departmental elements in planning, developing, and implementing STI activities. DOE-originated and worldwide literature and software on advances in subjects of interest to DOE researchers is collected, processed, and disseminated using computerized databases, publications, and other media.

This information collection containing over three million citations represents a major national resource of scientific and technical information. In addition to information acquired from DOE and its contractors, DOE acquires information through its international partnerships with the International Energy Agency's Energy Technology Data Exchange (ETDE), a consortium comprised of members from Europe, Japan, Canada, and the United States; the International Atomic Energy Agency's International Nuclear Information System, representing 80 countries; bilateral agreements with foreign governments; exchange agreements with other U.S. government agencies; and contracts with private information organizations and professional societies.

The subject scope of this information extends beyond energy, covering basic scientific studies in such areas as radiology, atomic and nuclear physics, radiation and nuclear chemistry, superconductivity, supercomputers, the environment, radioactive waste management, nuclear medicine, and arms control.

Major DOE databases are available within the United States through DIALOG Information Services and STN International and outside the United States through formal governmental exchange agreements. DOE and DOE contractor offices can access the databases online through the Integrated Technical Information System (ITIS) maintained by OSTI.

Energy Research Abstracts

Coverage

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports and patent applications originated by the U.S. Department of Energy, its laboratories, energy centers, and contractors, as well as theses and conference papers and proceedings issued by these organizations in report form. Audiovisual materials, computer media (magnetic tapes, diskettes, etc.), and engineering drawings are included in this definition. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations, *provided* that the full text of the document has been received by OSTI. Foreign report information is obtained through the International Energy Agency's 14-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. The purpose of this publication is to announce documents produced or obtained by DOE that are not so readily available as journal articles, books, or patents. Please note that beginning with the January 1991 issue, *ERA* does not cover nonreport literature.

Scope

The scope of *ERA* encompasses DOE's research, development, demonstration, and technology programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for online searching as records within the Energy Science and Technology Database (EDB). The current-year records are available on the Integrated Technical Information System (ITIS).

Availability

DOE and DOE contractors who have OSTI deposit accounts can obtain *ERA* (regular issues and annual indexes) from the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401, FTS 626-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA (regular issues and annual indexes) is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Doris M. Henline
Technical Editor, Robert W. Rutkowski

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

- Canada
- Denmark
- Finland
- France
- Federal Republic of Germany
- Italy
- Japan
- The Netherlands
- Norway
- Spain
- Sweden
- Switzerland
- United Kingdom
- United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 79 countries and 15 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a database for online retrieval. The database serves as well for the production of numerous OSTI publications.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in $30m^2$ air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts*. Descriptions of entries in these indexes follow.

Corporate Author Index

The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index

Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index

This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index

DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index

Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–
T1 15:18494 NTIS, OSTI E 1.99: DE89007246 MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the database records.* The following list includes all of the 38 first-level and the 313 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Energy Research Abstracts

01 COAL, LIGNITE, AND PEAT

6098 (DOE/EIA–0292(89)) **An assessment of the quality of selected EIA data series: Coal data, 1983–1988.** USDOE Energy Information Administration, Washington, DC (United States). Office of Statistical Standards. 25 Nov 1991. 85p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. Order Number DE92004652. Source: OSTI; NTIS; GPO; GPO Dep.

The purpose of this report is to present information on the quality of some of the Energy Information Administration's (EIA) coal data. This report contains discussions of data on production, direct labor hours, recoverable reserves, and prices from 1983 through 1988. Chapter 2 of this report presents a summary of the EIA coal data collection and identifies other sources providing similar data. Chapters 3 and 4 focus on data on coal production and direct labor hours, respectively. Detailed comparisons with data from the Mine Safety and Health Administration (MSHA) and State mining agencies are presented. Chapter 5 examines recoverable reserves. Included are internal comparisons as well as comparisons with other published reserve-related data, namely those of BXG, Inc. Chapter 6 describes how EIA obtains estimates of coal prices and discusses the variability in the prices caused by factors such as mine type, coal rank, and region. 5 figs., 5 tabs.

6099 (CONF-910571–, pp. 54-68) **Preparation of dewatered and deashed low-rank coals by oil agglomeration.** Musich, M.A. (Univ. of North Dakota, Grand Forks (United States)); DeWall, R.A.; Timpe, R.C. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The University of North Dakota Energy and Environmental Research Center (EERC) has developed an oil agglomeration process for low-rank coal (LRC) which produces a low-ash, low-moisture feedstock suitable for combustion and/or conversion (i.e., gasification, liquefaction). The EERC oil agglomeration process is divided into a high-shear coal-cleaning step and a low-shear agglomeration step. During the first step, a large percentage of the ion-exchangeable alkali metals (calcium, magnesium, sodium and potassium) are leached from the coal matrix. Simultaneously, this ion-exchange conditions the surface of the coal to make it more amenable to agglomeration. Low-shear mixing produces nearly spherically shaped agglomerates whose size can be controlled by the amount of bridging oil, time of mixing, and the geometry of the mixing system. Thermal deoiling of the raw agglomerates recovers the bridging oil for recycle, but leaves a portion of the oil to permanently bind the carbonaceous coal material together. The process has been tried, successfully, on four North Dakota lignites, three Wyoming subbituminous coals, and one Alaskan subbituminous coal. A number of low-value, coal- and petroleum-derived oil fractions have been tested as agglomerating agents. Ash reductions have ranged from 36 to 53 wt% for the subbituminous coals and from 71 to 79 wt% for the lignitic coals. More impressively, agglomeration followed by air drying has reduced the moisture content by 80 to 94 wt%. This paper describes the EERC oil agglomeration process, the hypothesized mechanism of low-rank coal agglomeration, and the effect of the operating parameters on various product qualities.

6100 (CONF-910571–, pp. 69-83) **Western Energy Company Advanced Coal Conversion process.** Sheldon, R.W. (Western Energy Co., Butte, MT (United States)); Rosholt, D.L.; Kujawa, S.T. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The Advanced Coal Conversion process (ACCP) consists of three process steps: drying, cooling and cleaning. These steps are described below for the demonstration plant being built in Colstrip, Montana. ASTM coal classification standards demonstrate that the subbituminous C coal feedstock is converted by the ACCP to a synthetic fuel classified as a high volatile bituminous C coal. As noted above, the synthetic upgraded coal product exhibits the characteristic of reduced pore volume, reduced oxygen, reduced hydrogen and increased aromaticity. The coal product has a reduced equilibrium moisture level and increased heating value; it retains a majority of its volatile matter with favorable ignition characteristics.

6101 (CONF-9106303–, pp. 31-32) **A new approach in ultrapurification of coal by selective flocculation.** Moudgil, B.M. (Univ. of Florida, Gainesville (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88917. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The general objective of the present study was to separate fine coal from ash forming minerals and pyrites using selective flocculation technology. Specifically, a mathematical model based on the 'active' sites concept was to be developed so that experimental conditions to achieve the desired separations for a given coal sample could be predicted. Samples of Pittsburgh coal, coal refuse and coal pyrite were used for single component flocculation tests. It was revealed that separation of coal from coal refuse/coal pyrite may be possible with highly cationic (Superfloc 362) and a nonionic polyacrylamide (Superfloc 16). However, selectivity indicated by single component tests was not realized in mixed mineral floccualtion tests. A major accomplishment of the research conducted is that a mathematical and computational model capable of predicting the optimum selectivity achievable with a given polymer has been developed and successfully verified experimentally.

6102 (CONF-9106303–, pp. 33-35) **Enhancement of surface properties for coal beneficiation.** Chander, S. (Pennsylvania State Univ., University Park (United States)); Aplan, F.F. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88934. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The need to clean coal for its effective utilization in steam generation is well recognized. To use the coal as a source of energy in an environmentally safe manner, pre-combustion desulfurization is considered to be a very cost-effective method. The main objective of this research project is to study ways to modify surface properties of coal, pyrite and ash-forming mineral matter for beneficiation of fine coal. Since the differences in surface properties of coal and mineral matter are utilized in several oil based preparation technologies, such as: froth flotation, emulsion flotation, spherical agglomeration and liquid-liquid separation, another objective is to delineate the role of oil. The following studies are being carried out to achieve the objectives stated in the previous paragraph: investigation of the natural hydrophobicity of coal and pyrite; development and evaluation of enhanced coal hydrophobicity; development and evaluation of reagents which modulate the hydrophobicity of pyrite;

development and evaluation of emulsion processes and their underlying principles.

6103 (CONF-9106303–, pp. 36-37) **Pelletization of fine coals.** Sastry, K.V.S. (Univ. of California, Berkeley (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89766. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The primary goal of this project is to provide the coal industry with a formal understanding and basis for selection, design and operation of coal pelletizing systems. Four specific research topics are chosen towards this end. These include - development of a unified agglomeration index for correlating growth and strength characteristics of coal fines, identification and development of methods for coal pellet characterization, surface (physical and chemical) principles of coal pelletization, and the role of binders and basis for binder selection. During the last one year, the research was concerned primarily with: investigations on the method of production of coal fines, the batch pelletization behavior of the base coals to establish the moisture requirements for pelletization, the extent of oxidation of coals, and the type and amount of additives; mathematical modeling investigations to aid in the fundamental understanding of the coal pelletization process; and exploratory studies on the methods for coal pellet characterization. Pelletization of coal fines can be primarily characterized by the amount of moisture required for pelletization which is determined by the coal properties. Kinetics of coal pelletization is discovered to be highly sensitive to minor variations in the coal properties during storage (oxidation) and during cleaning steps (flotation). The current efforts are being directed to understanding the reasons for this sensitivity and to find practical engineering solutions.

6104 (CONF-9106303–, pp. 38-40) **Control of pyrite surface chemistry in physical coal cleaning.** Luttrell, G.H. (Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States)); Yoon, Roehoan. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89789. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The primary objective of this research is to obtain fundamental knowledge concerning the surface properties of coal pyrite as they relate to advanced physical coal cleaning (APCC) processes. This objective will be met by (1) investigating the mechanisms responsible for the inefficient rejection of coal pyrite and (2) developing schemes for improving the rejection of coal pyrite based on information gathered from part (1). Studies conducted during the first year of this project indicate that the flotation recovery of coal pyrite may be attributed to (1) the presence of hydrophobic inclusions of carboneous material or (2) the formation of hydrophobic oxidation products, such as metal polysulfides, on the pyrite surfaces. In light of these findings, two different approaches were examined during the past year for improving pyrite rejection. The first approach involved the testing of organic depressants which are capable of selectively depressing pyrite particles containing carboneous material. The second approach focused on the development of reagents which create a reducing environment, thereby preventing the formation of hydrophobic oxidation products on the pyrite surfaces. Accomplishments of the research conducted to date are as follows: The hydrophobicity of coal pyrite is induced by superficial oxidation and/or the presence of carbonaceous material. Reducing the pulp potential is an effective means of preventing coal pyrite from acquiring hydrophobicity without deleterious effects on coal flotation. A novel organic depressant has been synthesized which contains no sulfur group in its structure.

6105 (CONF-9106303–, pp. 49-50) **Hydrocarbon-oil encapsulated bubble flotation of fine coal.** Peng, F.F. (West Virginia Univ., Morgantown (United States)); Eung Ha Cho. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The overall objective of the project is to obtain the flotation rate data using two types of bench scale flotation experiments to evaluate the effectiveness of oil-encapsulated bubble flotation for six ranks of coal. The six ranks of coal are Upper Freeport seam, Lower Kittaning seam, Pittsburgh seam, Wyodak seam, lignite and anthracite. The flotation cells are a stirred tank cell and a column flotation cell. When a mixture of air and gasified collector, such as kerosene, is dispersed into flotation cell, the oil-coated air bubble are created. This new collector dispersion technique applied in coal fine flotation will be compared with the flotation results obtained from using (1) direct collector addition, (2) ultra-sonically collector emulsifying and (3) atomizing collector addition techniques. The rate data and the surface characteristics of coal particles and oil-coated air bubbles will be correlated to achieve an understanding of the mechanisms of oil-coated bubble flotation on various ranks of coal for industrial applications. This period of work emphasized on establishing the testing methods and procedures for characterization of coal particle surfaces and oil-coated bubbles, as well as measurement of flotation responses for six ranks of coal, by using four different collector dispersion techniques. Upper Freeport seam coal was used in development of flotation procedures, and the hydrophobicity of coal particles determination. Similar procedure and instruments will be extended to study other five coals for comparison purposes.

6106 (CONF-9106303–, pp. 141-142) **Characterization of multiphase flow during air-sparged hydrocyclone flotation by X-ray CT.** Miller, J.D. (Univ. of Utah, Salt Lake City (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90311. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

Recent research carried out at the University of Utah indicates that X-ray computed tomography (CT) can provide a new dimension in the analysis of multiphase fluid-flow behavior. With such measurements, dispersed-phase concentration gradients in the swirl layer and froth phase of the air-sparged hydrocyclone can be determined during the actual flotation process. In this regard, the phenomenological details of multiphase flow in the air-sparged hydrocyclone are to be examined by X-ray computed tomography. In this program it is anticipated that time-averaged density variations can be established as a function of design and operating variables in order to more fully explain the observed flotation response of coal slurries and the extent to which ash and sulfur can be eliminated.

6107 (DOE/OR/03054–120) **SRC-I computer model.** Hardman, S.A. (UOP, Inc., Des Plaines, IL (United States). Process Div.); Landry, W.E. International Coal Refining Co., Allentown, PA (United States); UOP, Inc., Des Plaines, IL (United States). Process Div. Jun 1984. 368p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC05-78OR03054. Order Number DE92005192. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

Synfuels projects face considerable technical, political, and economic risks. This computer model (the SRC-I Computer Model) of an SRC-I Coal Liquefaction Facility was produced to assist in determining if there is sufficient profit incentive to justify the assumption of these risks. Venture analysis, using this model as a decision making tool, can clarify the relationship between plant size, plant configuration, and profitability. This model uses estimates of capital and operating cost, applied within the constraints of the anticipated business environment, to determine the economic merit of a project. (VC)

6108 (DOE/PC/79865–T1-Vol.3) **Development of clean coal and clean soil technologies using advanced agglomeration techniques: Volume 3, Soil Clean-up and hydrocarbon waste treatment process: ARC/EPRI Consortium Coal Processing**

Development Program. Ignasiak, B.; Ignasiak, T.; Szymocha, K. Alberta Research Council, Devon, AB (Canada). Coal and Hydrocarbon Processing Dept. Jan 1990. 67p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-87PC79865. Order Number DE92001740. Source: OSTI; NTIS; INIS; GPO Dep.

Three major topics are discussed in this report: (1) Upgrading of Low Rank Coals by the Agflotherm Process. Test data, procedures, equipment, etc., are described for co-upgrading of subbituminous coals and heavy oil; (2) Upgrading of Bituminous Coals by the Agflotherm Process. Experimental procedures and data, bench and pilot scale equipments, etc., for beneficiating bituminous coals are described; (3) Soil Clean-up and Hydrocarbon Waste Treatment Process. Batch and pilot plant tests are described for soil contaminated by tar refuse from manufactured gas plant sites. (VC)

6109 (DOE/PC/88925–T8) **Correlation of stability/rheology relationship with coal properties and chemical additives: Quarterly progress report, December 15, 1989–March 15, 1990.** Ohene, F. Grambling State Univ., LA (United States). Dept. of Chemistry. [1990]. 3p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88925. Order Number DE92005137. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to perform experiments to evaluate the necessary boundary conditions in the preparation and utilization of Coal Water Slurries and also develop a data base for the conceptual analysis of a prescription to predict slurry quality for a given coal candidate.

6110 (DOE/PC/90167–T3) **Mulled coal—A beneficiated coal form for use as a fuel or fuel intermediate: Final technical progress report No. 3, October 1, 1990–December 31, 1990.** Energy International Corp., Pittsburgh, PA (United States). May 1991. 22p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-90PC90167. Order Number DE92004968. Source: OSTI; NTIS; GPO Dep.

The storage, transport and handling of beneficiated coals in the form of a modified wet cake ("mulled coal") to yield a coal water fuel having acceptable properties for atomization and combustion on industrial, commercial and/or residential scales, have been investigated. The Mulled Coal project is divided into a series of tasks designed to produce formulations and system designs suitable to convert fine coal "wet cakes" into a material that can be stored, handled, and transported to a site where it can be utilized as a fuel in existing and developing combustion devices. (VC)

6111 (DOE/PC/90167–T4) **Mulled coal: A beneficiated coal form for use as a fuel or fuel intermediate: Phase 1 feasibility studies: Final.** Energy International Corp., Pittsburgh, PA (United States). Oct 1991. 34p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-90PC90167. Order Number DE92004847. Source: OSTI; NTIS; GPO Dep.

Energy International is developing a technology that will create a staged formulation with the first coal form (Mulled Coal) that can be stored, transported, and pumped. Just prior to combustion, the Mulled Coal (MC) would be modified to provide the properties needed for proper atomization. This concept is an alternative to the expensive and energy intensive thermal drying processing of fine coal wet cakes. The material is suitable for both direct feed use in conventional and fluid bed combustors as well as on-site conversion to combustible slurries. By maintaining the coal form relatively close to the feed wet cake, only minor processing with low additive levels and low energy blending needed at the point of production. Its conversion to slurry or other use-feed form is made near the time of use and thus the requirements for stability, climatic control, and other storage, transport, and handling requirements are much less severe.

6112 (DOE/PC/90176–T49) **Dewatering studies of fine clean coal: Annual technical report, September 1, 1990–August 31, 1991.** Parekh, B.K. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1991]. 34p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004185. Source: OSTI; NTIS; GPO Dep.

The main objective of the present research program is to study and understand dewatering characteristics of ultrafine clean coal obtained using the advanced column flotation technique from the Kerr-McGee's Galatia preparation plant fine coal waste stream. It is also the objective of the research program to utilize the basic study results, i.e., surface chemical, particle shape particle size distribution, etc., in developing a cost-effective dewatering method. The ultimate objective is to develop process criteria to obtain a dewatered clean coal product containing less that 20 percent moisture, using the conventional vacuum dewatering equipment. (VC)

6113 (DOE/PC/90176–T57) **The effect of moderate coal cleaning on microbial removal of organic sulfur: Final technical report, September 1, 1990–August 31, 1991.** Srivastava, V.J. Institute of Gas Technology, Chicago, IL (United States). [1991]. 39p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004193. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to provide data relevant to the development of an integrated physical, chemical, and microbiological process for the desulfurization of coal, utilizing existing technologies insofar as is possible. Specifically, the effect of increased surface area and porosity achieved by physical, chemical, and microbial treatments of coal on the subsequent microbiological removal of organic sulfur will be evaluated.

6114 (DOE/PC/90176–T59) **Recovery of fine coal from waste streams using advanced column flotation: Annual report, September 1, 1990–August 31, 1991.** Groppo, J.G. Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. [1991]. 49p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004195. Source: OSTI; NTIS; GPO Dep.

The advanced flotation techniques, namely column flotation, have shown potential in obtaining a low ash, low pyritic sulfur fine size clean coal. The overall objective of this program is to evaluate applicability of an advanced flotation technique, 'Ken-Flote' column to recover clean coal with minimum mineral matter content at greater than 90 percent combustible recovery from two Illinois preparation plant waste streams. Column flotations tests were conducted on the flotation feed obtained from the Kerr-McGee Galatia and Ziegler No. 26 plants using three different bubble-generating devices: sparger, gas saver and foam jet. Each of these devices was tested with three different frothers and various column-operating variable to provide maximum combustible recovery, minimum product ash and maximum pyrite rejection. For the Galatia slurry, the column provided a clean coal containing 5 percent ash, 0.48 percent pyritic sulfur at combustible recovery averaging 90 percent. In other words, about 90 percent ash and about 75 percent pyritic sulfur rejection were attained for the Galatia slurry. Pilot plant studies on this slurry basically obtained results similar to the laboratory studies. For the Ziegler No. 26, slurry column flotation provided a clean coal containing about 5 percent ash, 0.44 percent pyritic sulfur at more than 90 percent combustible recovery. The ash and pyrite sulfur rejection was about 85 percent and 65 percent, respectively.

6115 (DOE/PC/90176–T61) **Recovery of coal fines from preparation plant effluents: Final technical report, September 1, 1990–August 31, 1991.** Choudhry, V. Praxis Engineers, Inc., Milpitas, CA (United States). [1991]. 31p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004197. Source: OSTI; NTIS; GPO Dep.

The objectives of this project were to test and demonstrate the feasibility of recovering coal fines that are currently disposed of with coal preparation plant effluent streams and producing a fine clean coal product that can be blended with the plant coarse clean coal. This recovery was effected by means of Michigan Technological University's static tube flotation process, which was successfully demonstrated on a number of raw coals to reject 85% of the pyritic sulfur and recover 90% of the combustible matter. Under this project, the process parameters for the technology were modified for this application in order to recover a low-ash, low-sulfur clean coal that is, at a minimum, compatible with the quality of the clean coal currently produced by the preparation plant.

6116 (DOE/PC/90176–T62) **Fine coal flotation plant waste comparison–column vs. sub-a cells: Final technical report, September 1, 1990–August 31, 1991.** Ehrlinger, H.P. III. Illinois State Geological Survey, Urbana, IL (United States). [1991]. 36p.

Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004198. Source: OSTI; NTIS; GPO Dep.

The objective of this project was to compare results from a small commercially sized Deister Flotaire column flotation cell with the subaeration cells at Kerr-McGee's Galatia plant during side by side testing of feed splits from the same sources. Typical cell criteria for both cells are included in the appendix. The project involved the activities of three organizations: the Kerr-McGee Coal Corporation, the Deister Concentrator Company, and the Illinois State Geological Survey. Their roles were as follows: Kerr-McGee installed the Deister column with sample splitter and tailings volume measuring cell in the Galatia Coal Preparation Plant to treat a representative split of their flotation feed; Deister provided a 30 inch diameter × 35′ high Deister Flotaire Column Flotation Cell capable of treating nominally one ton per hour or slightly over 1% of the plant feed. Deister additionally provided the sample splitter and the tailings volume measuring cell. ISGS personnel worked with both companies on the installation, conducted laboratory tests to direct the early plant test reagent practice, attended all of the plant runs cutting representative samples of feed, measuring slurry and reagent flows, preparing samples and writing reports.

6117 (DOE/PC/90176–T64) **Process development for production of coal/sorbent agglomerates: Final technical report, September 1, 1990–August 31, 1991.** Rapp, D.M. Illinois State Geological Survey, Champaign, IL (United States). [1991]. 32p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004071. Source: OSTI; NTIS; GPO Dep.

The goal of this work was to develop a process flow diagram to economically produce a clean-burning fuel from fine Illinois coal. To accomplish this, the process of pelletizing fine coal with calcium hydroxide, a sulfur capturing sorbent, was investigated. Carbonation, which is the reaction of calcium hydroxide with carbon dioxide (in the presence of moisture) to produce a bonding matrix of calcium carbonate, was investigated as a method for improving pellet quality and reducing binder costs. Proper moisture level is critical to allow the reaction to occur. If too much moisture is present in a pellet, the pore spaces are filled and carbon dioxide must diffuse through the water to reach the calcium hydroxide and react. This severely slows or stops the reaction. The ideal situation is when there is just enough moisture to coat the calcium hydroxide allowing for the reaction to proceed. The process has been successfully demonstrated on a pilot-scale as a method of hardening iron ore pellets (Imperato, 1966). Two potential combustion options are being considered for the coal/calcium hydroxide pellets: fluidized bed combustors and industrial stoker boilers.

6118 (DOE/PC/90177–T5) **Evaluation, engineering and development of advanced cyclone processes: Quarterly technical progress report No. 4, July 1, 1991–September 30, 1991.** Coal Technology Corp., Bristol, VA (United States). [1991]. 43p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-90PC90177. Order Number DE92005197. Source: OSTI; NTIS; GPO Dep.

"Evaluation, Engineering and Development of Advanced Cyclone Processes" is a research and development project for the reduction of pyritic sulfur in coal. Project goals are to remove 80 to 90% of the ash and pyritic sulfur while retaining 80 to 90% of the parent coal's heating value. A number of media and media separator options are to be evaluated and tested, culminating with the implementation of the preferred combination in a 1,000 lb/hr bench-scale process optimization circuit.

6119 (DOE/PC/90178–T4) **Selective flotation of fossil resin from Western coal: Quarterly report, June 1, 1991–August 31, 1991.** Jensen, G.F.; Miller, J.D. Utah Univ., Salt Lake City, UT (United States). 15 Oct 1991. 22p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-90PC90178. Order Number DE92004910. Source: OSTI; NTIS; GPO Dep.

Technical activities for the fourth quarter involved efforts by both the University of Utah and Advanced Processing Technologies, Inc. Laboratory research at the University of Utah was primarily concerned with surface chemistry/resin characterization, which has emphasized Fourier transform infrared analysis in the past quarter. APT's major activities included proof-of-concept plant testing of the fossil resin flotation circuit. (VC)

6120 (DOE/PC/90295–T3) **Pyrite surface characterization and control for advanced fine coal desulfurization technologies: First annual report, September 1, 1990–August 30, 1991.** Wang, Xiang-Huai. Kentucky Univ., Lexington, KY (United States). [1991]. 52p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90295. Order Number DE92005140. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to conduct extensive studies on the surface reactivity of pyrite by using electrochemical, surface analysis, potentiometric and calorimetric titration, and surface hydrophobicity characterization techniques and to correlate the alteration of the coal-pyrite surface with the efficiency of pyrite rejection in coal flotation. The products as well as their structure, the mechanisms and the kinetics of the oxidation of coal-pyrite surfaces and their interaction with various chemical reagents will be systematically studied and compared with that of mineral-pyrite and synthetic pyrite to determine the correlation between the surface reactivity of pyrite and the bulk chemical properties of pyrite and impurities. The surface chemical studies and the studies of floatability of coal-pyrite and the effect of various parameters such as grinding media and environment, aging under different atmospheres, etc. on thereof, are directed at identifying the causes and possible solutions of the pyrite rejection problems in coal cleaning.

6121 (IS–5032) **Study of fine and ultrafine particles for coal cleaning: Fossil energy quarterly report, April 1, 1990–June 30, 1990.** Birlingmair, D.; Buttermore, W.; Enustun, V.; Pollard, J. Ames Lab., IA (United States). Jul 1990. 18p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-7405-ENG-82. Order Number DE92005173. Source: OSTI; NTIS; GPO Dep.

The primary objective of this research is to identify improved means for predicting the cleanability of fine and ultrafine coal by investigating the phenomena which govern laboratory techniques used to separate coal ground to find and ultrafine sizes for the determination of washability characteristics. This study seeks to identify and quantify factors other than gravity which affect separation, to establish limitations of density-based separation, and to develop techniques which will provide more accurate and consistent prediction of cleanability.

Victorian brown coal has an inherently low mineral matter content which makes it particularly attractive as a feedstock for the production of industrial carbons. Over the last decade, this vast resource of low rank coal has been extensively studied for its potential in the production of activated carbon, anode carbon, metallurgical reductant and other value added carbons. The chemical and physical characteristics of these carbon products are highly specific placing stringent conditions on the processes needed to upgrade the coal to carbon products. The methods used in modifying brown coal properties such as porosity, density and physical hardness to produce the various carbon products are discussed.

6123 (CONF-910571–, pp. 247-255) **Wilsonville Hot Gas Cleanup Test Facility.** Sears, R.E. (Southern Co. Services, Inc., Birmingham, AL (United States)); Gallaspy, D.T. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

Integrated gasification combined cycle (IGCC) has the potential to produce power in a cleaner and more efficient manner than conventional pulverized-coal fired units with flue gas desulfurization. The ability to clean the gas hot could reduce the cost of electricity by 10 to 15 percent. However, one of the main obstacles to utilizing these systems is the removal of hot particulates from the gas stream. In September of 1990 Southern Company Services (SCS) entered into an agreement with the Department of Energy to design, construct and operate a test facility to evaluate the long term performance of high temperature particulate control devices. The facility will be sized to handle 50 tons/day of coal feed, utilizing both bituminous and subbituminous coals, and will be located at SCS's pilot facilities in Wilsonville, Alabama. The gas generator for the facility will be based on M.W. Kellogg's transport reactor concept and will be operated in both pressurized gasification and combustion modes at temperatures and pressures up to 1,880F and 300 psig. The design of the facility is expected to be completed by the fall of 1992 with the target to have the facility operational by the first of 1994.

6124 (CONF-910571–, pp. 301-320) **High-pressure gasification of Montana subbituminous coal.** Goyal, A. (Inst. of Gas Technology, Chicago, IL (United States)); Bryan, B.; Rehmat, A. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

A data base for the fluidized-bed gasification of different coals at elevated pressures has been developed at the Institute of Gas Technology (IGT) with different ranks of coal at pressures up to 450 psig and at temperatures dictated by the individual coals. Adequate data have been obtained to characterize the effect of pressure on the gasification of Montana Rosebud subbituminous coal and North Dakota lignite. The results obtained with Montana Rosebud subbituminous coal are presented here.

6125 (CONF-910571–, pp. 321-341) **Process development of mild gasification for midwestern bituminous and western low-rank coals.** Aulich, T.R. (Univ. of North Dakota, Grand Forks (United States)); Ness, R.O.; Sharp, L. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

Development of the Energy and Environmental Research Center (EERC)/AMAX mild gasification process is progressing, using a 100-lb/hr process development unit (PDU) with a high-sulfur midwestern bituminous coal and a low-rank, low-sulfur western coal. This process development effort, one of four sponsored by the Department of Energy, is targeted to produce metallurgical coke substitutes, carbon black, activated carbon, diesel fuel additives, chemical feedstock materials, and pure chemicals. Work completed includes a market assessment, a process literature survey, 1-lb/hr bench-scale tests, and 100-lb/hr PDU tests. Technical and economic evaluation of these results is currently being completed, as is the cost estimation of a 1-ton/hr pilot plant. The PDU consists of a fast fluidized-bed carbonizer optimized for condensable production and a bubbling fluidized-bed calciner to reduce volatile and sulfur contents to acceptable levels for metallurgical coke production. Condensables are collected in three unit operations: a high-temperature tar venturi scrubber, a sieve tower, and a water venturi scrubber. Chars produced at 1,100F have ranged in volatile content from 15% for the subbituminous coal to 13% for the bituminous coal. Ash contents were 10% and 19%, respectively, for the subbituminous and bituminous coal chars, while sulfur contents were 0.4% and 3%, respectively. Three distinct boiling point fractions of liquids were collected from the condensation train. With subbituminous coal, the tar scrubber yielded liquids ranging in boiling point from 380-500C, the sieve tower liquids ranged from 200-470C, and the water scrubber liquids ranged from 170-440C. With the bituminous coal, the tar scrubber yielded liquids ranging in boiling point from 400-510C, and the combined sieve tower/water scrubber liquids ranged from 170-460C.

6126 (CONF-910571–, pp. 448-474) **The Charfuel coal refining process.** Meyer, L.G. (Carbon Fuels Corp., Englewood, CO (United States)). North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The patented Charfuel coal refining process employs fluidized hydrocracking to produce char and liquid products from virtually all types of volatile-containing coals, including low rank coal and lignite. It is not gasification or liquefaction which require the addition of expensive oxygen or hydrogen or the use of extreme heat or pressure. It is not the German pyrolysis process that merely 'cooks' the coal, producing coke and tar-like liquids. Rather, the Charfuel coal refining process involves thermal hydrocracking which results in the rearrangement of hydrogen within the coal molecule to produce a slate of co-products. In the Charfuel process, pulverized coal is rapidly heated in a reducing atmosphere in the presence of internally generated process hydrogen. This hydrogen rearrangement allows refinement of various ranks of coals to produce a pipeline transportable, slurry-type, environmentally clean boiler fuel and a slate of value-added traditional fuel and chemical feedstock co-products. Using coal and oxygen as the only feedstocks, the Charfuel hydrocracking technology economically removes much of the fuel nitrogen, sulfur, and potential air toxics (such as chlorine, mercury, beryllium, etc.) from the coal, resulting in a high heating value, clean burning fuel which can increase power plant efficiency while reducing operating costs. The paper describes the process, its thermal efficiency, its use in power plants, its pipeline transport, co-products, environmental and energy benefits, and economics.

6127 (CONF-910571–, pp. 475-488) **The Liquids From Coal mild gasification process: Handling and combustion properties of the solid process derived fuel.** McCord, T.G. (ENCOAL Corp., Houston, TX (United States)); Siddoway, M.A.; Farmayan, W.F. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The Liquids From Coal (LFC) process produces two new fuels, a liquid and a solid, that will be low sulfur alternatives. Handling, storage, combustion and ash utilization properties of the solid fuel, produced by applying the LFC Process to Powder River Basin coal, are described. Based on these properties, a Demonstration Plant is under construction at the Buckskin Mine in Wyoming.

6128 (CONF-9106303–, pp. 18-19) **Chemistry of coal-related microparticles.** Davis, E.J. (Univ. of Washington, Seattle (United States)); Krieger-Brockett, B. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89790. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to develop and apply novel single microparticle techniques to perform simultaneously thermogravimetric analysis and Raman/fluorescence spectroscopies on microparticles of coal (macerals) and sorbents (CaO) used for coal desulfurization. The combination electrodynamic balance/spectrometer system will be used to chemically characterize macerals from different ranks of coal and to explore the chemistry and chemical reaction rates associated with processes involving such microparticles. Rate processes will be examined at elevated temperatures by heating the particles electromagnetically. Measuring instruments, methods, and materials are described. Results to date are discussed.

6129 (CONF-9106303–, pp. 53-55) **Bioprocessing of lignite coals using reductive microorganisms.** Crawford, D.L. (Univ. of Idaho, Moscow (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88919. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

A number of aerobic bacteria, anaerobic bacteria, and anaerobic bacterial consortia capable of transforming lignite coals were isolated and characterized. The anaerobes carry out numerous reductive transformations of coal substructure model compounds. Transformations include decarboxylations, demethylations, dehydroxylations, and reduction of carbonyl groups and carbon-carbon double bonds. A number of aerobic, lignite coal-depolymerizing bacteria have been isolated. These strains depolymerize coal without significantly oxidizing it. Three selected strains have been shown to produce extracellular coal depolymerizing enzyme activities. Crude enzyme preparations from culture supernatants of these strains will substantially reduce the average molecular weight of a water soluble lignite coal polymer over incubation periods of 2-4 hours at 30-35C. Recent research shows that the enzymes involved may include extracellular peroxidases, esterases, and/or etherases. The authors are the first to report the production by bacterial of extracellular enzymes that catalyze the depolymerization of a macromolecular coal polymer. They have evidence that indicates that three different types of enzymes, including peroxidases, esterases, and etherases, may be involved in the depolymerization process. They have also isolated a number of strictly anaerobic bacteria which catalyze potentially useful reductive transformations of coal substructure model compounds. Methods are being developed to monitor and quantify these reductive biotransformations using lignite when coals as substrates.

6130 (CONF-9106303–, pp. 56-58) **Electrochemistry of Thiobacillus ferrooxidans reactions with pyrite.** Pesic, B. (Univ. of Idaho, Moscow (United States)); Oliver, D.J. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88920. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

A detailed cyclic voltametry study was performed on mineral pyrite. The following parameters were studied: effect of turbulence, scanning rates, and effect of nutrient addition. Two types of pyrite electrodes were used, which were characterized according to their use. One pyrite electrode was continuously present during fermentation and the other electrode was used as a control electrode. The key feature of the research was the study of pyrite interaction with T. ferrooxidans during their most active stage, i.e. growth. This kind of work was never performed before. Very important results were obtained. According to the obtained results, pyrite surface becomes quickly covered with T. ferrooxidans (within 2 days) which completely isolates the pyrite surface from the solution. The obtained cyclic voltametric data were also correlated with the SEM study. The reaction product which was responsible for pyrite passivation was characterized chemically and by X-ray diffraction. The chemical analysis showed its chemical composition very close to jarosite.

6131 (CONF-9106303–, pp. 61-62) **Bimetallic promotion of cooperative hydrogen transfer and heteroatom removal in coal liquefaction.** Eisch, J.J. (State Univ. of New York, Binghamton (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88930. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The ultimate objective of this research is to uncover new catalytic processes for the liquefaction of coal and for ungrading coal-derived fuels by removing undesirable organosulfur, organonitrogen and organooxygen constituents. Basic to both the liquefaction of coal and the purification of coal liquids is the transfer of hydrogen from such sources as dihydrogen, metal hydrides or partially reduced aromatic hydrocarbons to the extensive aromatic rings in coal itself or to aromatic sulfides, amines or ethers. Accordingly, this study is exploring how such crucial hydrogen-transfer processes might be catalyzed by soluble, low-valent transition metal complexes and/or Lewis acids under moderate conditions of temperature and pressure. In individual studies the catalytic potential of various Lewis acids in effecting hydrogen transfer from hydrogen donors to aromatic hydrocarbons, sulfides, ethers and amines has been evaluated. In parallel studies the corresponding catalytic potential of soluble nickel(O) complexes for such hydrogen transfers has also been evaluated. Now in the present work the author is concentrating on the possible synergistic action of combinations of Lewis acids with nickel(O) complexes in hydrogen transfer tht can lead to reduction of carbon-carbon unsaturation and the rupture of carbon-heteroatom bonds. At this point they have concluded that there is a synergistic action of these catalyst combinations and that desulfurization, deoxygenation and possibly denitrogenation can be promoted by these bimetallic catalysts.

6132 (CONF-9106303–, pp. 63-64) **Fundamental studies in production of C_2-C_4 hydrocarbons from coal.** Wiser, W.H. (Univ. of Utah, Salt Lake City (United States)); Oblad, A.G. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88940. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The project objectives are to demonstrate, in a specially-designed, continuous-flow reactor system, direct conversion of coal to C_2, C_3 and C_4 hydrocarbons; to examine the kinetics of the conversion process; and to gain understanding of the reaction pathways. A computer program will be developed to define the maximum yields of C_2, C_3, and C_4 hydrocarbons (individually) thermodynamically possible as a function of temperature, pressure, and percent steam in the steam-hydrogen feed to the reactor. The process will then be optimized for production of each of the hydrocarbons C_2, C_3 and C_4, and for production of olefins among these hydrocarbons.

6133 (CONF-9106303–, pp. 65-66) **Applications of micellar enzymology to clean coal technology.** Walsh, C.T. (Boston Univ., MA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89772. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The principle objective of this project is to investigate the technology of reverse micelle enzyme biochemistry in the desulfurization of model coal compounds and coal samples. The goal is to develop micellar systems that enhance enzyme-mediated oxidation of organic sulfur and its removal from organic substrates with minimum cleavage of carbon-carbon bonds. Model compounds in this study include dibenzothiophene (DBT) and ethylphenylsulfide (EPS). The primary emphasis is the investigation of isolated enzymes in micellar systems including horseradish peroxidase (HRP), chloroperoxidase, and laccase; microbial extracts are under study as well. Analytical methodology for quantitation of DBT, EPS and their sulfur oxidation products in reverse micelle solutions have been developed. The oxidative activity of HRP and laccase in the reverse micelle system has been demonstrated using conventional substrates. Tests of these enzymes in reverse micelles, as well as a microbial extract, have not indicated efficacy in oxidation of sulfur in DBT under conditions of study.

6134 (CONF-9106303–, pp. 67-68) **Mechanism of hydrodenitrogenation.** Miranda, R. (Univ. of Louisville, KY (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89771. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts* *and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The general objective of this project is to clarify the extent of participation of support acidity and catalyst acidity in general in the mechanistic steps leading to denitrogenation of hetero-aromatics. In particular, it is of interest to prove or disprove a bifunctional mechanism in which the acidic functionality catalyzes a Hofmann-like elimination step; to investigate which secondary reactions are catalyzed by acidity; and to qualify and quantify the effect of acidity on surface structure of Mo species. The particular objectives during this past year were (a) to continue with the characterization of the acidic catalysts developed in this project: molybdena supported on silica-aluminas of varying composition, and (b) to investigate the role of acidic sites by means of the piperidine HDN reaction. Details are given of the work done to date and results are discussed. To date the researchers have: (a) developed a complete series of silica-aluminas of varying composition and acidity characteristics; (b) developed a method to analyze (on-line) all of the products of piperidine denitrogenation reaction; and (c) showed the role of each type of acidity in the mechanism of piperidine denitrogenation and overall reaction.

6135 (CONF-9106303–, pp. 69-70) **Fundamental studies of catalytic processing of synthetic liquids.** Watson, P.R. (Oregon State Univ., Corvallis (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89783. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

This project investigates, using surface science techniques, the reactions of simple furans and phenols, acting as models for the O-heterocycles found in coal liquids, at designed surface sites on sulfided Mo and W surfaces. The objectives of the study are to elucidate the changes in the mode of adsorption, reactions and poisoning behavior, with particular attention to dehydrodeoxygenation (HDO), of normal and sterically-hindered heterocycles at various well-defined catalytic centers designed to have different chemical characteristics. The author has discovered how to reliably obtain and has characterized the adsorption/reaction sites on sulfided Mo(100) and (110) surfaces using Auger electron spectroscopy (AES) and low energy-electron diffraction (LEED). Above a S/Mo ratio of about 0.6 ML, furan does not adsorb on these surfaces. As the sulfur coverage is lowered increasing amounts of furan can be adsorbed, but temperature-programmed reaction spectroscopy (TPRS) reveals that decomposition occurs. The major products of adsorption are molecular CO and strongly chemisorbed hydrocarbon fragments that dehydrogenate over a range of temperatures. Performing the adsorption or thermal reaction in 10^{-6} torr of hydrogen does not change the mode of reaction significantly.

6136 (CONF-9106303–, pp. 71-74) **Preconversion catalytic deoxygenation of phenolic functional groups.** Kubiak, C.P. (Purdue Univ., West Lafayette, IN (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89770. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to prepare new catalysts for the deoxygenation of phenolic functional groups using carbon monoxide as the oxygen atom acceptor. The deoxygenation of phenols is a conceptually simple, but unusually difficult chemical transformation of importance in coal liquefaction. Present catalysts for removal of phenolic oxygen atoms are based on hydrodeoxygenation (HDO) methods. Typical HDO catalysts require high temperatures and H_2 pressures and lack selectivity. The author is studying the deoxygenation of phenols via the unprecedented use of the CO/CO_2 couple. Results to date are discussed.

6137 (CONF-9106303–, pp. 75-76) **Reactivity of young chars via energetic distribution measurements.** Calo, J.M. (Brown Univ., Providence, RI (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90307. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective of this project is to apply recently developed techniques to the prediction/correlation of the reactivity of 'young' chars, as producted from 'mild gasification' processes, for example. The principal thrust of the project is concerned with the quantitative mapping of the reactivity behavior of coal chars, as revealed by the energetic heterogeneity of carbon-oxygen surface complexes, with char preparation conditions; i.e., heating rate and ultimate temperature. The energetic distributions of oxygen surface complexes produced by carbon dioxide, steam, and oxygen will be determined from thermal desorption spectra obtained by temperature programmed desorption/mass spectrometry (TPD/MS), using techniques that have been developed in the author's laboratory for these purposes. The apparatus has been moved to a new laboratory and has been rebuilt. A new mass spectrometer has been acquired and interfaced with the TPD reactor. The effect of CO_2 partial pressure on subsequent TPD spectra has been examined in a scoping study involving a Wyodak coal char and a resin char. The effects of the 'inert,' diluent gases, Ar, N_2, and He, on char reactivity have been examined in a scoping study.

6138 (CONF-9106303–, pp. 79-81) **Design of a high activity and selectivity alcohol catalyst.** Foley, H.C. (Univ. of Delaware, Newark (United States)); Mills, G.A. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective of this reasearch is to design a new alumina-supported bimetallic catalyst, containing molybdena and a second reduced metal like rhodium, for the selective reduction of carbon monoxide to methanol and higher alchols. It is paramount that a thorough understanding of the respective roles of rhodium and molybdenum be established in terms of the kinetics of reduction, as well as the chemical and physical states of the metals. The experimental facilities that are required to do this research have been designed and constructed during this first year. These include the installation of a Schlenk line for anaerobic catalyst synthesis, the redesign of the high pressure reactor, the design and construction of a low pressure reactor, and the design and construction of a volumetric chemisorption unit and a C.I. electrobalance. Work is underway to examine the secondary acid dehydration of primary product alcohols and to determine compositional effects on metals dispersion.

6139 (CONF-9106303–, pp. 82-83) **Catalysis and cocatalysis of bond cleavages in coal and coal analogs.** Miller, B. (Univ. of Massachusetts, Amherst (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90298. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to elucidate mechanisms for transfer hydrogenolysis and catalysis of hydrogenolysis of aryl-heteroatom and aryl-carbon bonds, and to develop more effective, inexpensive catalysts for coal conversion. Products from thermolysis of 9-substituted anthracenes in tetralin, including a product resulting from incorporation of solvent at C-9 positions of the anthracenes, have been identified. The first examples of catalysis of transfer hydrogenolysis of aryl-heteroatom bonds by aromatic polyethers in the absence of hydrogen bonding agents have been observed.

6140 (CONF-9106303–, pp. 84-85) **Probe molecule studies: Active species in alcohol synthesis.** Blackmond, D.G.

(Univ. of Pittsburgh, PA (United States)); Wender, I. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90305. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective of this work is to study the in-situ addition of probe molecules to CO hydrogenation reactions for the formation of alcohols. The incorporation of these probe molecules, which include nitromethane and substituted acetylenes, into the reaction network promises to provide important information about the mechanisms of alcohol formation. The first half year of the project has been devoted to building a high pressure reaction system with a liquid syringe pump for addition of the probe molecules. Analytical systems for identifying and quantifying products have also been set up and tested, including a GC-MS system with dual capillary and packed columns for separation and analysis of hydrocarbon and oxygenate products. Experiments are currently being carried out with a Cu/ZnO catalyst under methanol-producing conditions.

6141 (CONF-9106303–, pp. 86-87) **Biotic and abiotic carbon to sulfur bond cleavage.** Frost, J.W. (Purdue Univ., West Lafayette, IN (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90294. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

Mechanisms exploited by microbes to cleave carbon to sulfur (C-S) bonds in organosulfur molecules are to be delineated. Chemical mimics of these biotic processes are then to be elaborated. The ability of Escherichia coli to use organosulfonic acids as a sole source of sulfur during growth has been established. This degradative system possessed by E. coli will cleave virtually any organosulfonate C-S bond as long as there is one methylene adjacent to the sulfonic acid. Degradation results in products where the sulfonic acid is replaced by an alcohol. Based on deuterium labelling experiments, the mechanisms responsible for this biotic C-S bond cleavage involves an intermediate α-hydroxyorganosulfonate. An alternate formulation involving direct insertion of oxygen between the carbon and sulfur atoms of the sulfonic acid is not consistent with the deuterium labelling experiments. Results to date are discussed.

6142 (CONF-9106303–, pp. 90-91) **Advanced, soluble hydroliquefaction and hydrotreating catalysts.** Laine, R.M. (Univ. of Washington, Seattle (United States)); Stoebe, T. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90313. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

Previous work in this group has shown that, surface confined, organometallic catalysts are exceptionally effective for hydrogenation and HDN of coal model compounds such as quinoline. Unfortunately, surface confined catalysts have not proven to be particularly effective when used with coal itself. The problem derives from the fact that: (1) liquefaction is a solid (catalyst)-liquid (coal polymer) reaction system where, (2) diffusion of coal bonds to the heterogeneous catalyst surface is mass transport limited and controls liquefaction rates. Furthermore, heterogeneous catalyst mediated liquefaction is surface area dependent, placing another constraint on reaction rates. The purpose of the present program is to develop soluble analogs of surface confined catalysts that can be impregnated directly into the coal structure at low temperatures. Heteropolyanions (HPAs) offer the opportunity to develop soluble forms of surface confined catalysts. HPAs, are inexpensive, well-characterized, water soluble metal oxide clusters, e.g. $[EM_{12}O_{40}]^{4-}$ where E = Si or P and M = Mo or W. They are easily modified to contain other transition metals such as Co, Ni or Ru and, can be made soluble in organic solvents. The protic forms exhibit extremely high acidities $pK_a \approx 0$-2. In addition, selectively modified HPAs can function as low temperature hydrogenation catalysts that exhibit microporosity. HPAs are multi-functional catalysts that could be used to promote both hydroliquefaction and hydrotreating. The program consists of three major tasks: (1) preparation of candidate HPA precatalysts; (2) HDN and HDO modeling studies and (3) direct liquefaction studies. Work to date is discussed.

6143 (CONF-9106303–, pp. 92-93) **Steam gasification of carbon: Catalyst properties.** Falconer, J.L. (Univ. of Colorado, Boulder (United States)); Lauderback, L.L. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88915. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to determine the catalyst composition and concentration for metal oxide catalyzed gasification of carbon. This involves measuring the concentration of active catalytic sites at reaction conditions, the composition of the catalyst, and the site-specific rate constant. This information will provide insight into the reaction mechanism and how to maximize catalyst dispersion. Most of the experimental efforts during the last year have been devoted to transient studies of gasification. A series of experiments with various catalyst loadings and at various temperatures were carried out. They identified modifications that were required to obtain accurate and reproducible data. Major modifications were made to the transient reaction system as a result of these experiments. The delay times were decreased dramatically from 26 sec to 2.6 sec, after an extensive experimental study to identify limiting factors. These modifications have allowed the system to be put into full operation and another series of experiments were carried out on $K_2CO_3/^{13}C$ mixtures using CO_2 to gasify the mixture. Based on these experiments, modifications in the sample preparation were required, and with this new preparation procedure, reproducible results were obtained. An isopropanol/water solution was found to be effective for dissolving K_2CO_3 and wetting carbon.

6144 (CONF-9106303–, pp. 94-96) **Alkali/TX_2 catalysts for CO/H_2 conversion to C_1-C_4 alcohols.** Klier, K. (Lehigh Univ., Bethlehem, PA (United States)); Herman, R.G. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88933. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to investigate and develop novel sulfur-tolerant catalysts for the conversion of coal-derived synthesis gas into C_1-C_4 alcohols by a highly selective process. Therefore, the variations of catalyst activity and selectivity for the synthesis of alcohols from $H_2/CO \leq 1$ synthesis gas for a series of A/TX_2 compounds, where A is a surface alkali dopant, T is a transition metal, and X is S is being determined. The preparation, catalytic testing, and characterization of MoS_2, RuS_2, and NbS_2 catalysts has been accomplished. Both stoichiometric and nonstoichiometric TX_2 compounds have been examined. Under the reaction conditions employed to-date, the Cs/MoS_2 catalyst exhibits the highest activities and selectivities toward the synthesis of oxygenates. The HR-ESCA surface analyses of the catalysts using the SCIENTA-300 ESCA has demonstrated that useful chemical information is provided, especially from the valence band spectral region. For example, the MoS_2 band structure is well-developed for particles as small as 6 nm, but distinct differences are noted when compared with the spectrum obtained from single crystal MoS_2, e.g. states appear in the dispersed sulfide above the top of the valence band of the single crystal MoS_2, and these might be reflected in catalytic behavior. The thermodynamic stabilities of the TS_2 catalysts against loss of sulfur in a reducing environment have been calculated, and it is shown that MoS_2 and NbS_2 should be stable without H_2S being present in the synthesis gas.

6145 (CONF-9106303–, pp. 97-98) **Inhibition of retrogressive reactions in coal/petroleum co-processing.** Schobert, H.H. (Pennsylvania State Univ., University Park (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88935. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective of this project is to develop a fundamental understanding of the reactions occurring at the onset of coke formation during the co-processing of coals with petroleum residua. The knowledge of pathways to coke formation would allow the selection of appropriate coal/petroleum feedstock combinations and processing conditions to minimize or eliminate coke formation. Specific objectives include examination of chemical components on retardation of enhancement of coke formation. Set of five coals have been reacted with a set of five model compounds representative of components of heavy petroleum fractions. The model compounds range from purely aliphatic, eicosane, through alkylated aromatics to purely aroamtic, pyrene. The coals were also reacted with three petroleum resids. Mass transfer and mixing effects were evaluated compring data from reactions conducted in vertical vs. horizontal agitated microautoclave reactors. Three reaction temperatures and two gas atmospheres were used in all of the reactions. The yield of tetrahydrofuran (THF) insolubles is the lowest in the presence of pyrene. The values obtained for reaction with coal/eicosane and coal/1-phenyldodecane are very close to eacy other, as well as are the ones for coal in reaction with 1,4-diisoprolylbenzene and durene. The yields for THF-insolubles in the reactions with the petroleum resids at 400C are in the range of the values obtained with pyrene. At the lower reaction temperature (350C) the petroleum resids did not act as 'good' solvents in terms of enhancing coal conversion while the results from the reactions at 450C indicated the presence of retrogressive reactions, the coal conversion having negative values. The effect of the reaction temperature is in addition related to the fluidity of the coal. The optimum temperatures for coal conversion seem to coincide with the maximum fluidity temperature of the coal.

6146 (CONF-9106303–, pp. 99-101) **Novel supports for coal liquefaction catalysts.** Haynes, H.W. Jr. (Univ. of Wyoming, Laramie (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88942. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objectives of this research are first to construct a Catalytic Coal Liquefaction Microreactor (CCLM) and then to use this unit to screen catalysts prepared from novel and/or modified supports for coal liquefaction applications. Run lengths will be sufficient to give a measure of catalyst deactivation rate. Modified supports will include aluminas treated with alkali and alkaline earth metals and halogens. Novel supports will include carbons, single component oxides and composite oxides. Efforts will be made to correlate coking tendency with catalyst acidity measurements. Shakedown operations of the CCLM during the past year have resulted in significant improvements to the unit. In addition, these runs have demonstrated that the novel ebullated bed microreactor provides an excellent means for evaluating hydrotreating kinetics. Heretofore this has not been possible in a unit of this size. A firm foundation has thus been laid for the next step of the program - the introduction of coal into the unit.

6147 (CONF-9106303–, pp. 25-26) **The effect of selective solvent absorption on coal conversion.** Larsen, J.W. (Lehigh Univ., Bethlehem, PA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

This project has two objectives: (1) to determine the composition of the recycle solvent actually present within the coal during the early stages of direct liquefaction; (2) to determine the effect of the presence or absence of hydrogen donors within the coal during the early stages of coal conversion. The experimenal work to date has been directed solely at the first of the objectives listed above. An apparatus has been designed and constructed which allows the exposure of coals to Wilsonville recycle oil at temperatures between 120 and 180C at various solvent:coal ratios. Both Illinois No. 6 coal and Wyodak subbituminous coal have been so exposed. The coals do absorb solvent and swell. The amount of solvent absorbed increases with the exposure temperature. The proton NMR of the whole recycle oil and of the non-absorbed part of the recycle oil have been compared (Illinois No. 6 coal). The spectra are identical, in spite of the fact that the coal has absorbed between 15 and 23% of the recycle oil, depending on conditions. The molecular weight distributions of the recycle oil before and after a portion has been removed by absorption, are identical. The tentative conclusion is that, for this relatively non-polar recycle oil, no selective absorption by Illinois No. 6 coal is occurring.

6148 (CONF-9106303–, pp. 102-103) **Control of catalytic hydrotreating selectivity with ammonia.** Satterfield, C.N. (Massachusetts Inst. of Tech., Cambridge (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89775. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The author has discovered that the presence of a low concentration of ammonia can substantially reduce the rate of hydrogen uptake of an aromatic compound on an industrial $NiMo/Al_2O_3$ catalyst while under similar conditions it has only a mild inhibiting effect on hydrodenitrogenation (of quinoline). This suggests a method under industrial reaction conditions of minimizing undesired aromatic hydrogenation during catalytic hydrodenitrogenation and hydrotreating. He plans to explore this effect in more detail by model compound studies, with attention to their relevance to hydrotreating coal liquids. Studies have proceeded in two phases: First, the author observes that coal liquids contain substantial amounts of a base fraction that seems to consist of hydroxy pyridines, hydroxy indoles and/or hydroxy anilines. He first performed a limited hydrotreating study with 8-hydroxy quinoline (8 HQ) dissolved in tetralin utilizing a $NiMo/Al_2O_3$ catalyst in a packed bed reactor operating at 360C and 385C and 6.9 MPa. He finds that the HDN reaction of this compound proceeds by three routes to enter the quinoline reaction network. In the second, more recent phase, he has been studying the hydrotreatment of a mixture of quinoline and naphthalene. Quinoline was chosen as the model heterocyclic compound. Naphthalene was selected as the model aromatic hydrocarbon. In brief, he finds that added NH_3 has little effect on the hydrogenation rate of naphthalene, but a marked inhibiting effect on hydrogenation of tetralin. Thus selectivity is controlled in the direction of a partially hydrogenated aromatic product, which is desired for coal liquefaction. A kinetic model is being developed to summarize these results.

6149 (CONF-9106303–, pp. 104-105) **Enhanced coal hydrogasification via oxidative pretreatment.** Miller, D.J. (Michigan State Univ., East Lansing (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89777. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

Enhancement of coal hydrogasification rate via oxidative treatments is investigated with the objective of developing optimal oxidation methods and conditions to maximize conversion rate. Emphasis is placed on characterizing surface oxygen groups, which are responsible for the active sites for gasification, and on fundamental aspects of the carbon-hydrogen reaction, including catalysis and rate inhibition. Methods and materials are described and results are discussed. Three-fold hydrogasification rate enhancements were observed following oxidation of partially gasified coal and Saran char. Similar results were obtained for outgassed chars. Moderate rate enhancements (50-100%) were observed following oxidation of partially gasified chars impregnated with K_2CO_3 catalyst. Results indicate that oxygen groups desorb during heatup to provide reactive sites at which hydrogasification occurs; oxygen chemisorption measurements indicate more active sites following oxidation of the char surfaces. Hydrogasification rate is correlated with oxygen chemisorption.

6150 (CONF-9106303–, pp. 111-112) **Novel reactor configuration for syngas conversion to alcohols.** Akgerman, A. (Texas A and M Research Foundation, College Station (United States)); Anthony, R.G. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89787. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective if this research is to develop a new, efficient reactor configuration and process for the synthesis of methanol and higher alcohols from coal gasification products. Preliminary work has shown that a trickle bed reactor with a mineral oil flowing cocurrently with the gas feed down the reactor over a fixed bed of catalyst is more efficient than existing gas phase and slurry reactors. The authors will determine the effects of temperature, space velocity, synthesis gas/mineral oil feed ratio, and $H_2/CO/CO_2$ ratio on conversion and product distribution in a small laboratory trickle bed reactor; determine the intrinsic kinetics of the reaction in a slurry reactor; optimize and design a pilot size trickle bed unit; simulate the performance of this unit; and compare the performance in terms of yield and selectivity to slurry reactors. They have developed a model for the trickle bed reactor that takes into account gas and liquid phase hydrodynamics, mass transfer between the two phase together with vapor liquid equilibrium at the interface, mass transfer into catalyst particle, effective diffusion rates, partial wettingof the catalyst particle, wetted and dry regions in the bed, and the reaction kinetics. They started determining the reaction kinetics in a slurry reactor that operates in the perfectly mixed mode with well defined hydrodynamics. Various kinetic model equations in the literature are simulated at typical operating conditions to determine how well they agree with each other and they run experiments at points of maximum discrepancy between the various models. This approach reduces the total number of experiments significantly.

6151 (CONF-9106303–, pp. 113-114) **Novel process for depolymerization of coal to C_2-C_4 hydrocarbons.** Wiser, W.H. (Univ. of Utah, Salt Lake City (United States)); Oblad, A.G. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89788. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The overall project objective is to design, construct and operate a continuous-flow reactor system for direct catalytic depolymerization of coal to produce C_2-C_4 hydrocarbons, which reactor may serve as a prototype for scale-up. To aid in achieving that overall objective, a companion research project is to provide kinetic data to assist in the design. Any products removed in the liquid state from the reactor system of the companion project will be characterized, including evaluation of any hydrogen-donor capability. A special reactor has been designed and constructed, incorporating quartz glass windows for visual observation, in which the operation of a catalyst bed fluidized by super-critical, coal-derived fluids will be examined. The capability of a coal-derived, hydrogen-donor fluid, in the super-critical state, to control agglomeration of a strongly caking coal, in the catalyst bed, will be evaluated. Finally, a continuous reactor system intended to serve as a prototype for scale-up will be designed, constructed and operated.

6152 (CONF-9106303–, pp. 115-116) **Mild coal pretreatment to improve liquefaction reactivity.** Miller, R.L. (Colorado School of Mines, Golden (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90289. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

This project continues the research program at CSM to develop an advanced low severity coal liquefaction scheme using mild chemical pretreatment of the coal to enhance coal dissolution reactivity. The process consists of three main steps: (1) mild pretreatment of the feed coal at ambient temperature and pressure using methanol or other common organic solvent with a trace amount of hydrochloric acid (or other common acid) to enhance dissolution reactivity and dry the coal, (2) low severity thermal dissolution of the treated coal to obtain a very reactive coal-derived residual material amenable to upgrading, and (3) catalytic upgrading of the residual products to distillate liquids. The objective of the present project is to perform the necessary experimental work and data analysis to acquire and understand, from a more fundamental physicochemical basis, the following detailed information related to mild chemical pretreatment of coal: types and extent of coal bond cleavage during pretreatment and subsequent low severity thermal dissolution; effect of pretreatment on the coal's physical structure including surface are modifications; relationships between bond cleavage, metal chloride formation, coal conversion kinetics, and liquid and gaseous yields; liquid and residuum product characterization, including residuum reactivity towards catalytic or thermal upgrading to distillate liquid products.

6153 (CONF-9106303–, pp. 117-118) **Rapid pressure swing absorption cleanup of post-shift reactor synthesis gas.** Sirkar, K.K. (Stevens Inst. of Tech., Hoboken, NJ (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90300. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

This investigation is concerned with the separation of gas mixtures using a novel concept of rapid pressure swing absorption (RAPSAB) of gas in a stationary absorbent liquid through gas-liquid interfaces immobilized in the pore mouths of hydrophobic microporous membranes. The process is implemented in a module well-packed with hydrophobic microporous hollow fiber membranes. The specific objectives are (1) to develop a theoretical model which will provide guidelines for selecting an efficient RAPSAB process cycle which includes desorption; (2) to demonstrate the concept experimentally with a simple gas mixture (e.g., CO_2-N_2) and a simple absorbent liquid such as water, and (3) to extend the concept to reactive absorbent liquids for the separation of CO, CO_2 from the post-shift reactor synthesis gas. A simplified theoretical description of the novel rapid pressure swing absorption process has been developed. The absorption part of the pressure swing absorption cycle has been predicted for CO_2-N_2-water system. Numerical simulation of the model is being carried out for different operating conditions for selecting an optimum pressure swing cycle.

6154 (CONF-9106303–, pp. 123-125) **Supercritical fluid thermodynamics for coal processing.** van Swol, F. (Univ. of Illinois, Urbana (United States)); Eckert, C.A. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88922. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United

States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

Because of their unusual solvating and mass transfer properties, supercritical fluids (SCF) show potential for a variety of coal processing applications. The main objective of this research is to develop a predictive equation of state so that SCF solvents can be tailored for the extraction and processing of coal. To meet this objective, the authors are carrying out a two pronged approach. First, a database containing the solubilities of coal model compounds in high temperature fluids, polar fluids, and fluid mixtures has been collected and is being extended. Second, they are looking at the intermolecular interactions between the solute and the solvent, cosolvent, and other solute molecules using spectroscopic techniques. All this information gives them the means to develop an equation of state that accurately reflects the true molecular makeup of the solution.

6155 (CONF-9106303–, pp. 130-131) **Novel coal feeder for low-sulfur fuel.** Soonjai Khang (Univ. of Cincinnati, OH (United States)); Keener, T.C. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The project objective is to study the feasibility of an advanced coal desulfurization concept in a coal feeder. It is proposed to construct a novel coal feeder which contains dual screw tubes, the inner tube acting as a coal pyrolizer and the outer tube acting as a desulfurizer with hot calcined limestone pellets or other renewable sorbent pellets. The inner screw feeder pyrolyses coal particles in a reducing environment which produces sulfur-containing gases such as H_2S and COS. Hot calcined limestone pellets (or other renewable sorbent pellets) are added to the outer tube and react with sulfur components. Based on the experimental data on both the pyrolysis and the limestone-based desulfurization, the proposed system is expected to remove between 50 and 80% sulfur from various high-sulfur coals. Works under progress are (1) literature review on coal pyrolysis, (2) computer/math modeling of the pyrolysis section, (3) evaluation of pyrolysis kinetics, (4) experimental pyrolysis in an auger feed tube. The conclusions are: (1) pseudo-component approach for the pyrolysis kinetics, (2) a 48% desulfurization was achieved at residence times of 7 minutes for a pyrolysis temperature of 450C, indicating a reasonable expectation for the goal of the project.

6156 (CONF-9106303–, pp. 136) **Chemical kinetics and transport processes in supercritical fluid extraction of coal.** McCoy, B.J. (Univ. of California, Davis (United States)); Smith, J.M. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90288. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to investigate the supercritical fluid extraction, both catalytic and noncatalytic, of hydrocarbons from coal. Continuous-flow extraction experiments have been conducted on Montana lignite and Illinois No. 6 coal with supercritical tert-butanol. The fraction extracted and the aromatic contentof the extract increased with temperature. Insight into the chemical nature of the extract, and the effect of solvent interaction with coal, was obtained by detailed GC-MS analysis of the extract, both liquid and gas. The results indicate that tert-butanol, a hydrogen donor solvent, enhances the thermal degradation of coal, and that higher conversion of supercritical extraction can be achieved with tert-butanol than with toluene under the same conditions.

6157 (CONF-9106303–, pp. 145-146) **Indirect electrolysis process for removal of pollutants from coal liquids.** Koval, C.A. (Univ. of Colorado, Boulder (United States)); Noble, R.D. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88916. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The authors are exploring a novel separation process for the removal of nonvolatile nitrogen and sulfur pollutants from coal liquids. The process involves the binding of the pollutants to metalloporphyrin carriers. The binding is reversed by electrochemical oxidation of the carrier and the active form of the carrier is regenerated by reductive electrolysis. The efficiency of the process is evaluated by investigating the removal of a representative set of pollutants from solutions of iso-octane. Separations involving individual pollutants and mixtures of pollutants will be examined. Mathematical models which utilize the physical properties that are relevant to the separation process have been developed. These models will be used to determine conditions that produce optimal separation efficiencies. Results are discussed on experimental studies with iron porphyrins and ion-exchange polymers, the development of mathematical models, and the investigation of redox polymers on electrodes.

6158 (CONF-9106303–, pp. 147-149) **Mechanistic and kinetic studies of high-temperature coal gas desulfurization sorbents.** Sarofim, A.F. (Massachusetts Inst. of Tech., Cambridge (United States)); Flytzani-Stephanopoulos, M. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88927. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objectives of this project are to: (1) carry out kinetic measurements of the reduction of Zn-Ti-O mixed oxides to determine the optimum sorbent in terms of composition and chemical phases which yield the desired resistance to zinc loss by reduction, (2) carry out kinetic measurements of the sulfidation reactions including intrinsic reaction rate and product layer diffusion measurements for both Zn-Ti-O and ZnO materials, and (3) determine structural changes and chemical phase transformations during sulfidation. Experimental methods are described and results and conclusions to date are summarized.

6159 (CONF-9106303–, pp. 181-182) **High-temperature membranes for H_2S and SO_2 separations.** Winnick, J. (Georgia Inst. of Tech., Atlanta (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90293. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to develop a high temperature membrane separation technique which can be applied to gas mixtures involved in coal utilization. For coal gasification, H_2S is removed from the syn-gas stream, split into hydrogen, which enriches the syn-gas, and sulfur, which can be condensed from an inert gas sweep stream. For coal combustion, SO_2 is separated from the flue gas, with concentrated SO_3 produced as a by-product. Both processes appear economically viable, but each requires fundamental improvements: more efficient membranes and a more efficient anode for the H_2S cell. Particle size determinations led to initial optimization of ceramics loading in tape cast membranes. Coating of substrate material with polyethylene glycol solutions enhanced removal of the dried 'green' tapes. Highlights of results include the following for the SO_2 removal cell: identified possible replacement electrode material, lithiated NiO; increased current density from 1 mA/cm^2 to 5 mA/cm^2 (sustained) at 1.5 V cathodic overpotential; and reached 10 mA/cm^2 for short periods of time, but was limited by heating of inlet gas. Results include the following for the H_2S removal cell: used to polish natural gas streams with low concentrations of H_2S and prevented transport of H_2 from cathode to anode and subsequent oxidation of carbonate supporting electrolyte.

6160 (CONF-9106305–1) **Demonstration plant for IGCC using the U-GAS process.** Lau, F.S. (Institute of Gas Technology, Chicago, IL (United States)); Salo, K. Institute of Gas Technology, Chicago, IL (United States). [1991]. 18p. Sponsored by Institute of Gas Technology. From 18. world gas conference; Berlin (Germany); 24-28 Jun 1991. Source: OSTI; Institute of Gas Technology, 3424 South State Street, Chicago, IL 60616.

Tampella, Ltd., in cooperation with the Institute of Gas Technology (IGT), is developing the gasification technology for U-GAS® to produce electricity from coal using the integrated gasification combined-cycle (IGCC). The concept of IGCC is to join the clean burning gasification island with a more efficient gas and stream turbine island to produce electric power with minimal environmental impact. IGT has developed the U-GAS process to produce a low- or medium-Btu gas from different types of coal feedstocks. The process uses a combination of fluidized=bed gasification and ash agglomeration in a single-stage reactor. A 30-tons/day-capacity pilot plant located in Chicago has been used to develop the process. Feedstocks ranging from relatively unreactive metallurgical coke to highly reactive peat have been gasified successfully in the this pilot plant, indicating its ability to handle a feedstock with widely varying properties. A new 10 megawatt pilot plant has been designed and is under construction in Tampere, Finland, as the first step toward the commercialization of this technology. Tampella is planning to design and deliver a commercial-scale IGCC demonstration plant by 1994. 7 refs., 5 figs.

6161 (CONF-9109211–Absts.) **Liquefaction contractors' review meeting: Abstracts.** USDOE Pittsburgh Energy Technology Center, PA (United States). [1991]. 38p. Sponsored by U.S. DOE Fossil Energy. From Direct liquefaction contractors' review meeting; Pittsburgh, PA (United States); 3-5 Sep 1991. Order Number DE92003113. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy and Pittsburgh Energy Technology Center sponsored a Contractors' Review Meeting in Pittsburgh, Pennsylvania September 3–5, 1991. This report is a compilation of the abstracts for talks presented at the meeting.

6162 (DOE/MC/11076–3017) **Mild gasification of Usibelli coal in an inclined fluidized-bed reactor.** Merriam, N.W.; Thomas, K.P.; Cha, C.Y. Western Research Inst., Laramie, WY (United States). Feb 1991. 52p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC21-86MC11076. Order Number DE91002097. Source: OSTI; NTIS; GPO Dep.

Results of mild gasification tests of minus 16-mesh Usibelli coal in an inclined fluidized-bed reactor are described in this report. The minus 16-mesh fraction was separated from the coal by screening. The coal was dried to zero moisture content, and about 2 wt % of the volatiles was removed as gas by partial decarboxylation using a 100-lb/hr inclined fluidized-bed dryer. The dried coal was subjected to mild gasification at maximum temperatures of 1050 to 1250°F (566 to 677°C) and feed rates of 7.5 lb/hr while using a once-through flow of carbon dioxide as fluidizing gas in a 1-inch-wide, inclined fluidized-bed reactor. Mild gasification of the dried coal resulted in production of 44 to 56 wt % of the dried coal as char, 10 to 13 wt % as liquids, 17 to 28 wt % as gas, and 8 to 21 wt % as fines. The yield of moisture- and ash-free (MAF) liquids varied from 11.4 to 14.2 wt % of the dried coal feed. Chemical analysis was carried out on these products.

6163 (DOE/MC/24248–3015) **Development and application of a probabilistic evaluation method for advanced process technologies: Final report.** Frey, H.C.; Rubin, E.S. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Center for Energy and Environmental Studies. Apr 1991. 364p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC21-88MC24248. Order Number DE91002095. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to develop and apply a method for research planning for advanced process technologies. To satisfy requirements for research planning, it is necessary to: (1) identify robust solutions to process design questions in the face of uncertainty to eliminate inferior design options; (2) identify key problem areas in a technology that should be the focus of further research to reduce the risk of technology failure; (3) compare competing technologies on a consistent basis to determine the risks associated with adopting a new technology; and (4) evaluate the effects that additional research might have on comparisons with conventional technology. An important class of process technologies are electric power plants. In particular, advanced clean coal technologies are expected to play a key role in the energy and environmental future of the US, as well as in other countries. Research planning for advanced clean coal technology development is an important part of energy and environmental policy. Thus, the research planning method developed here is applied to case studies focusing on a specific clean coal technology. The purpose of the case studies is both to demonstrate the research planning method and to obtain technology-specific conclusions regarding research strategies.

6164 (DOE/MC/25006–3011) **Enhanced durability of desulfurization sorbents for fluidized-bed applications.** Gupta, R.P.; Gangwal, S.K. Research Triangle Inst., Research Triangle Park, NC (United States). Jun 1991. 101p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC21-88MC25006. Order Number DE91002090. Source: OSTI; NTIS; GPO Dep.

Advanced integrated gasification combined cycle (IGCC) power systems require the development of high-temperature desulfurization sorbents capable of removing hydrogen sulfide from coal gasifier down to very low levels. The objective of this investigation was to identify and demonstrate methods for enhancing the long-term chemical reactivity and mechanical strength of zinc ferrite, a leading regenerable sorbent, for fluidized-bed applications. Fluidized sorbent beds offer significant potential in IGCC systems because of their ability to control the highly exothermic regeneration involved. However, fluidized beds require a durable, attrition-resistant sorbent in the 100–300 μm size range. A bench-scale high-temperature, high- pressure (HTHP) fluidized-bed reactor (7.6-cm I.D.) system capable of operating up to 24 atm and 800°C was designed, built and tested. A total of 175 sulfidation-regeneration cycles were carried out using KRW-type coal gas with various zinc ferrite formulations. A number of sorbent manufacturing techniques including spray drying, impregnation, crushing and screening, and granulation were investigated. While fluidizable sorbents prepared by crushing durable pellets and screening had acceptable sulfur capacity, they underwent excessive attrition during multicycle testing. The sorbent formulations prepared by a proprietary technique were found to have excellent attrition resistance and acceptable chemical reactivity during multicycle testing. However, zinc ferrite was found to be limited to 550°C, beyond which excessive sorbent weakening due to chemical transformations, e.g., iron oxide reduction, was observed.

6165 (DOE/PC/79816–8) **Slurry phase Fischer-Tropsch synthesis: Cobalt plus a water-gas shift catalyst, January 1, 1990–March 30, 1990.** Yates, I.C.; Satterfield, C.N. Massachusetts Inst. of Tech., Cambridge, MA (United States). [1990]. 6p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79816. Order Number DE92004500. Source: OSTI; NTIS; GPO Dep.

Experiments to study cobalt-catalyzed reactions of light 1-alkenes added to synthesis gas feed have been performed. Data have been collected at 220°C, 0.45 to 1.48 MPa and a synthesis gas flow rate between 0.015 and 0.030 Nl/(gcatmin) with H_2/CO of 1.45 to 2.25. C_2H_4, C_3H_6, and C_4H_8 were added to the synthesis gas feed in concentrations ranging from 0.5 to 1.2 mole% of total feed. For each material balance in which 1-alkenes were added, a material balance was performed at similar process conditions without 1-alkenes added. This use of "base case" process conditions should make data analysis and interpretation easier. Material balances without 1-alkenes were also repeated to allow verification of catalyst selectivity stability. A total of 49 balances were performed during a single run which lasted over 2500 hours-on-stream. The hydrocarbon data have not yet been completed analyzed.

6166 (DOE/PC/88802–T7) **Exploratory coprocessing research: Quarterly report no. 6, December 1, 1989–February 28, 1990.** Hirschon, A.S.; Tse, D.S.; Malhorta, R.; McMillen, D.F.; Ross, D.S. SRI International, Menlo Park, CA (United States). Apr 1990. 9p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88802. Order Number DE92003087. Source: OSTI; NTIS; GPO Dep.

The objectives of this quarter's work were to conduct coprocessing experiments in our new microreactor system, where the reactors are agitated by an electric reciprocating saw. Since Wyodak coal was shown to be more susceptible to pretreatment in the larger, 300-mL autoclaves, we decided to begin with this coal. Coprocessing experiments were conducted using pretreatments at 250°C and at 350°C, where a ratio of 1 part coal and 2 parts Maya ATB and 1200 psig of hydrogen was heated at 425°C. In each case the pretreatment increased the conversions, in agreement with the experiments in the larger autoclave. Based on hexane insoluble material, coal conversions ranged from 40% for conversions with no pretreatment, to 60% conversion with pretreatment at 350°C. The 350°C pretreatment gave the greatest degree of conversion which is consistent with FIMS pyrolysis data described in the previous quarter. In future work, pretreatment by other methods will also be conducted, as well as a more thorough evaluation of the aqueous pretreatment. 4 refs., 1 fig., 1 tab.

6167 (DOE/PC/88802–T8) **Exploratory coprocessing research: Final report, September 1988–June 1991.** Hirschon, A.S.; Tse, D.S.; Malhotra, R.; McMillen, D.F.; Ross, D.S. SRI International, Menlo Park, CA (United States). 5 Sep 1991. 60p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88802. Order Number DE92004846. Source: OSTI; NTIS; GPO Dep.

The objectives of this project were to (1) study the scope of the beneficial effects of hydrothermal pretreatment of coal on subsequent conversion, (2) identify and study the chemical or physical causes of this effect, and (3) attempt to elucidate the chemistry responsible for any coal-resid synergisms.

6168 (DOE/PC/88818–10) **Two-stage, close coupled catalytic liquefaction of coal: Tenth quarterly report, 1 January 1991–31 March 1991.** Comolli, A.G.; Johanson, E.S.; Panvelker, S.V.; Popper, G.A.; Stalzer, R.H. Hydrocarbon Research, Inc., Princeton, NJ (United States). Aug 1991. 50p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88818. Order Number DE92004520. Source: OSTI; NTIS; GPO Dep.

The first calendar quarter of 1991 was a productive period with two bench-scale studies, microautoclave support studies, mini-Process Development Unit (PDU) preparations, and process modelling. Several catalyst presulfiding agents and CO_2 effects upon liquefaction were evaluated in microautoclave scale tests. Dimethyl disulfide will be used for the PDU scale-up based on the results of these tests and prior data. Carbon dioxide appears to enhance coal conversion; however, gas and water yields are increased indicating possible water gas shift-hydrocarbon synthesis reactions. In the bench-scale studies, the rejuvenation of spent catalyst with acid and carbon burn-off produced catalytic activity akin to fresh and catalyst in a 12 day evaluation. A 14 day study of the addition of high concentrations of CO_2 to a sub-bituminous coal liquefaction system demonstrated the occurrence of water gas shift hydrocarbon synthesis reactions and conversely higher coal conversions and distillate yields with high hydrogen consumptions. Preparations for a PDU Demonstration Run on Black Thunder Mine coal are underway. The British Coal Filtration Process will be used for solid separation. The results of microautoclave scale tests on Illinois, Ohio and Black Thunder Mine coals were reviewed and statistically analyzed to provide a sound basis for kinetic interpretation.

6169 (DOE/PC/88927–12) **Mechanistic and kinetic studies of high-temperature coal gas desulfurization sorbents: Final report, July 1988–July 1991.** Lew, S.; Flytzani-Stephanopoulos, M.; Sarofim, A.F. Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Chemical Engineering. Oct 1991. 206p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88927. Order Number DE92004184. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project was to investigate the properties of and evaluate mixed oxides of zinc and titanium for hot fuel gas desulfurization. Uncombined ZnO was also investigated as a base case. Detailed investigation of the reduction and sulfidation reactions of Zn-Ti-O sorbents was performed. The intrinsic kinetics and the product layer diffusion rates in reduction and sulfidation were determined. Kinetic experiments with sorbents containing various Zn/Ti atomic ratios were performed. Chemical phase and structural transformations were followed by various methods. The results were compared to similar experiments performed with ZnO. The purpose of these experiments was to determine how the presence of titanium dioxide affects the reduction and sulfidation of ZnO. This information would be used to identify and select the sorbent composition that gives the best combination of low reduction rate and acceptable sulfidation performance at temperatures exceeding 600°C. (VC)

6170 (DOE/PC/88935–T9) **Inhibition of retrogressive reactions in coal/petroleum co-processing: Quarterly technical progress report, July 1, 1991–September 30, 1991.** Schobert, H.H.; Tomic, J. Pennsylvania State Univ., University Park, PA (United States). Nov 1991. 20p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88935. Order Number DE92005141. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to develop a fundamental understanding of the reactions occurring at the onset of coke formation during the co-processing of coals with petroleum residua. The specific objectives include examination of chemical components, or groups of components, in coals and petroleum feedstocks to quantify and rank the effects of these components in retarding or enhancement of coke formation. The work involves bench scale reactions in microautoclaves, supplemented by studies of the carbonaceous residues by such techniques as diffuse reflectance Fourier transform infrared spectroscopy and ^{13}C nuclear magnetic resonance spectrometry.

6171 (DOE/PC/89770–T3) **Preconversion catalytic deoxygenation of phenolic functional groups: Quarterly technical progress report, April 1, 1991–June 30, 1991.** Kubiak, C.P. Purdue Univ., Lafayette, IN (United States). Dept. of Chemistry. [1991]. 13p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-89PC89770. Order Number DE92005198. Source: OSTI; NTIS; GPO Dep.

The deoxygenation of phenols is a conceptually simple, but unusually difficult chemical transformation to achieve. Aryl carbon-oxygen bond cleavage is a chemical transformation of importance in coal liquefaction and the upgrading of coal liquids as well as in the synthesis of natural products. This proposed research offers the possibility of effecting the selective catalytic deoxygenation of phenolic functional groups using CO. A program of research for the catalytic deoxygenation of phenols, via a low energy mechanistic pathway that is based on the use of the CO/CO_2 couple to remove phenolic oxygen atoms, is underway. We are focusing on systems which have significant promise as catalysts: Ir(triphos)OPh, $[Pt(triphos)OPh]^+$ and Rh(triphos)OPh. Our studies of phenol deoxygenation focus on monitoring the reactions for the elementary processes upon which catalytic activity will depend: CO insertion into M-OPh bonds, CO_2 elimination from aryloxy carbonyls {M-C(O)-O-Ph}, followed by formation of a coordinated benzyne intermediate.

6172 (DOE/PC/89775–6) **Control of catalytic hydrotreating selectivity with ammonia: Quarterly report, July 1, 1991–September 30, 1991.** Satterfield, C.N.; Lee, C.M. Massachusetts Inst. of Tech., Cambridge, MA (United States). [1991]. 16p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-89PC89775. Order Number DE92003082. Source: OSTI; NTIS; GPO Dep.

The hydrogenation of phenanthrene in the presence of 24 kPa of ammonia was studied during the hydrodenitrogenation (HDN) of quinoline on a sulfided $NiMo/Al_2O_3$ catalyst at 360°C, 6.9 MPa total H_2 pressure in a vapor phase tubular reactor. Ammonia, through competitive adsorption, reduced the formation of phenanthrene hydrogenated products and the hydrocracking of 9,10-dihydrophenanthrene to biphenyl. The effects occur largely when the HDN reactions are substantially completed. 6 refs., 8 figs., 1 tab.

6173 (DOE/PC/89781–8) **A novel coal feeder for production of low sulfur fuel: Annual technical progress report, October 1, 1990–October 1, 1991.** Khang, S.J.; Lin, L.; Keener, T.C.; Yeh, P. Cincinnati Univ., OH (United States). [1991]. 56p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-89PC89781. Order Number DE92004521. Source: OSTI; NTIS; GPO Dep.

A dual-screw feeder was designed for desulfurization of coal. This reactor contains two screw tubes, the inner tube acting as a coal pyrolizer and the outer tube acting as a desulfurizer with hot calcined lime pellets or other renewable sorbent pellets. The objectives of this project is to study the feasibility of an advanced concept of desulfurization and possibly some denitrification in this coal feeder. In this year, two basic studies have been performed: (1) the desulfurization and (2) the denitrification due to mild pyrolysis. Specifically, the following tasks have been performed: (1) Setting up the Dual-Screw reactor, (2) Determination of the pyrolysis product and the sulfur distribution in char, tar and gas based on experimental data, (3) Study of the devolatilization, the desulfurization kinetics and the denitrification kinetics and obtaining the basic kinetic parameters, (4) Study of the sulfur removal efficiency of lime pellets fed into the outer tube of the dual-feeder reactor, (5) Study of the effect of the coal particle size on pyrolysis and desulfurization, (6) Study of the coal pyrolysis and desulfurization using a TGA(Thermal Gravimetric Analyzer).

6174 (DOE/PC/89787–T2) **Novel reactor configuration for synthesis gas conversion to alcohols: Quarterly report, July 1, 1991–September 30, 1991.** Akgerman, A.; Anthony, R.G. Texas A and M Univ., College Station, TX (United States). Dept. of Chemical Engineering. 1991. 11p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-89PC89787. Order Number DE92004873. Source: OSTI; NTIS; GPO Dep.

Our objectives during this quarter were to complete construction and shake down runs on our new reactor assemblies, obtain activity data on the catalyst employing the slurry reactor, incorporate pressure drop and change in number of moles options into our reactor simulation code and start experiments in the trickle bed reactor.

6175 (DOE/PC/89790–8) **Chemistry of coal-related microparticles: [Quarterly report], 1 July 1991–31 September 1991.** Davis, E.J.; Krieger-Brockett, B. Washington Univ., Seattle, WA (United States). Dept. of Chemical Engineering. [1991]. 4p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-89PC89790. Order Number DE92004523. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to develop and apply novel single microparticle techniques to perform simultaneously thermogravimetric analysis and Raman/fluorescence spectroscopies on microparticles of coal (macerals) and sorbents (CaO) used for coal desulfurization. The combination electrodynamic balance/spectrometer system is being used to chemically characterize macerals from different ranks of coal and to explore the chemistry and chemical reaction rates associated with processes involving such microparticles. Rate processes will be examined at elevated temperatures by heating the particles electromagnetically, and significant part of the research involves the design, construction and utilization of a microparticle heating system.

6176 (DOE/PC/89878–T6) **Fundamental studies of water pretreatment of coal: Seventh quarterly report, April 1, 1991–June 30, 1991.** Serio, M.A.; Solomon, P.R.; Kroo, E.; Charpenay, S.; Bassilakis, R. Advanced Fuel Research, Inc., East Hartford, CT (United States). 25 Oct 1991. 12p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-89PC89878. Order Number DE92004871. Source: OSTI; NTIS; GPO Dep.

During the seventh quarter, water pretreatment experiments were done at lower pressures (1000 psig), with early H_2O injection or continuous H_2O injection, and with demineralized coals. In addition, a set of blank experiments was done with all four coals in helium at the following conditions: 350°C; 4000 psig; 20 minutes. An additional experiment was done with the Zap lignite at atmospheric pressure. Helium was used instead of nitrogen since it can be obtained in highly pure grades. The purpose of the blank experiments is to determine how much of the water pretreatment process is a thermal and/or pressure effort. The residues from the standard water pretreatment experiments with Illinois and Pittsburgh coals were subjected to analysis by TG-FTIR, solvent extraction, solvent swelling, oxygen reactivity index and donor solvent liquefaction. The pyridine extractables were analyzed. With regard to liquefaction behavior, improvements in the yields of oils and toluene solubles are observed for selected Illinois and Pittsburgh coals at longer pretreatment times ($\geq$ 60 minutes).

6177 (DOE/PC/89883–27) **Coal liquefaction process streams characterization and evaluation: Quarterly technical progresss report, January 1–March 31, 1991.** Brandes, S.D.; Winschel, R.A.; Burke, F.P.; Robbins, G.A. Consolidation Coal Co., Library, PA (United States). Research and Development Dept. Sep 1991. 53p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-89PC89883. Order Number DE92004518. Source: OSTI; NTIS; GPO Dep.

Consol R&D is conducting a three-year program to characterize process and product streams from direct coal liquefaction process development projects. The program objectives are two-fold: (1) to obtain and provide appropriate samples of coal liquids for the evaluation of analytical methodology, and (2) to support ongoing DOE-sponsored coal liquefaction process development efforts. The two broad objectives have considerable overlap and together serve to provide a bridge between process development and analytical chemistry.

6178 (DOE/PC/90005–T51) **Liquid phase methanol LaPorte process development unit: Modification, operation, and support studies: Task 2.2, Alternate catalyst Run E-6 and catalyst activity maintenance Run E-7: Appendix A, Run E-6 detailed data acquisition sheets: Appendix B, Run E-7 detailed data acquisition sheets.** Air Products and Chemicals, Inc., Allentown, PA (United States); Chem Systems, Inc., Tarrytown, NY (United States). 2 Feb 1991. 445p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC90005. Order Number DE92000280. Source: OSTI; NTIS; GPO Dep.

This report consists of Detailed Data Acquisition Sheets for Runs E-6 and E-7 for Task 2.2 of the Modification, Operation, and Support Studies of the Liquid Phase Methanol Laporte Process Development Unit. (Task 2.2: Alternate Catalyst Run E-6 and Catalyst Activity Maintenance Run E-7).

6179 (DOE/PC/90005–T53) **Liquid phase methanol LaPorte process development unit: Modification, operation, and support studies: Task 2.2, Alternate catalyst Run E-6 and catalyst activity maintenance Run E-7.** Air Products and Chemicals, Inc., Allentown, PA (United States); Chem Systems, Inc., Tarrytown, NY (United States). 2 Feb 1991. 85p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC90005. Order Number DE92000279. Source: OSTI; NTIS; GPO Dep.

The primary focus of this Process Development Unit operating program was to prepare for a confident move to the next scale of operation with a simplified and optimized process. The main purpose of these runs was the evaluation of the alternate commercial catalyst (F21/0E75-43) that had been identified in the laboratory under a different subtask of the program. If the catalyst proved superior to the previous catalyst, then the evaluation run would be continued into a 120-day life run. Also, minor changes were made to the Process Development Unit system to improve operations and reliability. The damaged reactor demister from a previous run was replaced, and a new demister was installed in the intermediate V/L separator. The internal heat exchanger was equipped with an expansion loop to relieve thermal stresses so operation at higher catalyst loadings and gas velocities would be possible. These aggressive conditions are important for improving process economics. (VC)

6180 (DOE/PC/90005–T54) **Liquid phase methanol LaPorte process development unit: Modification, operation, and support studies: Task 3.5: Development of fundamental rate models for methanol synthesis in a slurry reactor.** Air Products and Chemicals, Inc., Allentown, PA (United States); Chem Systems, Inc., Tarrytown, NY (United States). 11 Mar 1991. 54p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC90005. Order Number DE92002585. Source: OSTI; NTIS; GPO Dep.

The objectives of the present work can be divided into three parts. The first objective was to develop a best-fit model for the older methanol synthesis catalyst (BASF S3-85) data base. At the time that this work commenced (June 1989), the BASF S3-85 data base contained many rate measurements accumulated over a few years. The newer catalyst (BASF S3-86) data base, at that time, contained only a few observations and did not include a broad range of conditions. Thus, a second objective of this work was to expand the BASF S3-86 data base to include more rate observations over a broader range of conditions. Finally, after expansion of the BASF S3-86 data base, the third objective was to develop a rate expression to describe this data base. This would include the application of rate expressions developed for the BASF S3-85 catalyst, as well as new models. (VC)

6181 (DOE/PC/90044–4) **High octane ethers from synthesis gas-derived alcohols: Technical progress report, July 1, 1991–September 30, 1991.** Klier, K.; Herman, R.G.; Johannson, M.; Feeley, O.C.; Bogar, S.; Lawson, E.; Kieke, M. Lehigh Univ., Bethlehem, PA (United States). Zettlemoyer Center for Surface Studies. Nov 1991. 42p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-90PC90044. Order Number DE92004519. Source: OSTI; NTIS; GPO Dep.

The objective of the proposed research is to synthesize high octane ethers, primarily methyl isobuty ether (MIBE) and methyl tertiary butyl ether (MTBE), directly from $H_2/CO/CO_2$ coal-derived synthesis gas via alcohol mixtures that are rich in methanol and 2-methyl-1-butanol (isobutanol). The overall scheme involves gasification of coal, purification and shifting of the synthesis gas, higher alcohol synthesis, and direct synthesis of ethers.

6182 (DOE/PC/90176–T50) **Ultrasound-promoted chemical desulfurization of Illinois coals: Final technical report, September 1, 1990–August 31, 1991.** Chao, S.S. Institute of Gas Technology, Chicago, IL (United States). [1991]. 36p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004186. Source: OSTI; NTIS; GPO Dep.

The overall objectives of the program were to investigate the use of ultrasound to promote coal desulfurization reactions and to evaluate chemical coal desulfurization schemes under mild conditions through a fundamental understanding of their reaction mechanisms and kinetics. The ultimate goal was to develop an economically feasible mild chemical process to reduce the total sulfur content of Illinois Basin Coals, while retaining their original physical characteristics, such as calorific value and volatile matter content. During the program, potential chemical reactions with coal were surveyed under various ultrasonic irradiation conditions for desulfurization, to formulate preliminary reaction pathways, and to select a few of the more promising chemical processes for more extensive study.

6183 (DOE/PC/90176–T51) **Chemical coal cleaning using selective oxidation: Final technical report, September 1, 1990–August 31, 1991.** Palmer, S.R.; Hippo, E.J. Southern Illinois Univ., Carbondale, IL (United States). Dept. of Mechanical Engineering and Energy Processes. [1991]. 28p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004187. Source: OSTI; NTIS; GPO Dep.

The primary objective of this study is to investigate the removal of both mineral and organic sulfur from Illinois coals using low temperature selective oxidation. This overall objective is to develop new methods for either physical/chemical or physical/microbial cleaning of Illinois coal. Innovative approaches to achieve deep cleaned products, containing both ash and sulfur contents less than 0.5 percent, will be considered. Experiments focus on developing cost-effective methods for the removal of organic sulfur and finely disseminated mineral impurities, especially fine pyrite particles, from coal. Rates and mechanisms for organic sulfur removal will be studied. Chemical reagent recycling and/or reagent wastes will be studied. Chemical reagent recycling and/or reagent wastes handling are included. Bench scale studies are performed.

6184 (DOE/PC/90176–T52) **Evaluation of sulfur-reducing microorganisms for organic desulfurization: Final technical report, September 1, 1990–August 31, 1991.** Miller, K.W. Illinois State Univ., Normal, IL (United States). Dept. of Biological Sciences. [1991]. 31p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004188. Source: OSTI; NTIS; GPO Dep.

Because of substantial portion of the sulfur in Illinois coal is organic, microbial desulfurization of sulfidic and thiophenic functionalities could hold great potential for completing pyritic sulfur removal. We are testing the hypothesis that organic sulfur can be reductively removed as H_2S through the activities of anaerobic microorganisms. Our objectives for this year include the following: (1) To obtain cultures that will reductively desulfurize thiophenic model compounds. In addition to crude oil enrichments begun last year, we sampled municipal sewage sludge. (2) To continue to work toward optimizing the activity of the DBDS-reducing cultures obtained during the previous year. (3) To expand coal desulfurization work to include other coals including Illinois Basin Coal 101 and a North Dakota lignite, which might be more susceptible to the dibenzyldisulfide reducing cultures due to its lower rank. (4) To address the problem of sulfide sorption, by investigating the sorption capacity of coals in addition to Illinois Basin Coal 108.

6185 (DOE/PC/90176–T53) **Bioconversion of coal-derived synthesis gas to liquid fuels: Final technical report, September 1, 1990–August 31, 1991.** Jain, M.K. Michigan Biotechnology Inst., Lansing, MI (United States). [1991]. 35p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004189. Source: OSTI; NTIS; GPO Dep.

The use of coal-derived synthesis gas as an industrial feedstock for production of fuels and chemicals has become an increasingly attractive alternative to present petroleum-based chemicals production. However, one of the major limitations in developing such a process is the required removal of catalyst poisons such as hydrogen sulfide (H_2S), carbonyl sulfide (COS), and other trace contaminants from the synthesis gas. Purification steps necessary to remove these are energy intensive and add significantly to the production cost, particularly for coals having a high sulfur content such as Illinois coal. A two-stage, anaerobic bioconversion process requiring little or no sulfur removal is proposed, where in the first stage the carbon monoxide (CO) gas is converted to butyric and acetic acids by the CO strain of Butyribacterium methylotrophicum. In the second stage, these acids along with the hydrogen (H_2) gas are converted to butanol, ethanol, and acetone by an acid utilizing mutant of Clostridium acetobutylicum. 18 figs., 18 tabs.

6186 (DOE/PC/90176–T56) **Genetic engineering of sulfur-degrading Sulfolobus: Final technical report, September 1, 1990–August 31, 1991.** Ho, N.W.Y. Purdue Univ., Lafayette, IN (United States). Lab. of Renewable Resources Engineering. [1991]. 16p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004192. Source: OSTI; NTIS; GPO Dep.

The objectives of the proposed research is to first establish a plasmid-mediated genetic transformation system for the sulfur degrading Sulfolobus, and then to clone and overexpress the genes encoding the organic-sulfur-degrading enzymes from Sulfolobus as well as from other microorganisms, to develop a Sulfolobus-based microbial process for the removal of both organic and inorganic sulfur from coal.

6187 (DOE/PC/90176–T58) **Combined chemical and microbiological removal of organic sulfur from coal: Technical report, September 1, 1990–August 31, 1991.** Raphaelian, L.A. Institute of Gas Technology, Chicago, IL (United States). [1991]. 26p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004194. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to investigate techniques for chemically converting the sulfur containing organic compounds in coal to compounds that can be treated microbiologically to remove the organically bound sulfur. The goal is to achieve an economically feasible mild chemical oxidation of the organic sulfur in a representative Illinois Basin coal by converting the sulfur to sulfoxides and sulfones; the carbon sulfur bond in the sulfoxides and sulfones would then be broken microbiologically and the sulfur removed from the coal as sulfate.

6188 (DOE/PC/90176–T60) **VHF EPR determination of the chemical forms of organic sulfur in coal: Final technical report, September 1, 1990–August 31, 1991.** Clarkson, R.B. Illinois Univ., Urbana, IL (United States). [1991]. 24p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004196. Source: OSTI; NTIS; GPO Dep.

This program addresses the need for innovative approaches to characterize the organic sulfur in Illinois Basin coals. We have developed a very high frequency electron paramagnetic resonance

(EPR) spectrometer operating at the W-band of microwave frequencies (96 GHz). This instrument has shown unique sensitivity to heteroatoms in coal, and we believe the technique can be successfully applied for the non-destructive, direct determination of organic sulfur in coal. Preliminary data from Illinois coals and separated macerals indicate that the method also may be able to distinguish aromatic from aliphatic sulfur, and may be useful in assessing the extent of conjugation in aromatic portions of the coal. These high energy spectroscopic techniques, however invariably suffer from the fact that they are not truly non-destructive. By contrast, the low powers and relatively low energy radiation used in magnetic resonance techniques have virtually no effect on the physical structure or chemical composition of coal.

6189 (DOE/PC/90176–T63) **New regents for coal desulfurization: Final technical report, September 1, 1990–August 31, 1991.** Buchanan, D.H.; Kalembasa, S.; Olson, D.; Wang, S.; Warfel, L. Eastern Illinois Univ., Charleston, IL (United States). [1991]. 28p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004199. Source: OSTI; NTIS; GPO Dep.

The primary goal of this project was development and exploration of potential new desulfurization reagents for the removal of "organic sulfur" from Illinois coals by mild chemical methods. Potential new desulfurization reagents were investigated using organic sulfur compounds of the types thought to be present in coals. Reagents included low-valent metal complexes based on nickel and on iron as well as possible Single Electron Transfer reagents. Soluble coal extracts served as second generation model compounds during this reagent development project.

6190 (DOE/PC/90523–11) **Phase behavior of coal fluids: Data for correlation development: Report period: August 15, 1989–October 15, 1989.** Robinson, R.L. Jr.; Gasem, K.A.M.; Shaver, R.D. Oklahoma State Univ., Stillwater, OK (United States). School of Chemical Engineering. 15 Oct 1989. 28p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-86PC90523. Order Number DE92004325. Source: OSTI; NTIS; GPO Dep.

During the present report period, our framework for correlating saturation properties using the scaled-variable-reduced coordinate approach was used to develop a correlation for saturated liquid densities of pure fluids at temperatures from the triple point to the critical point. The new correlation results in precise representation of liquid densities of diverse chemical species with average errors of 0.12% when two adjustable parameters are used to characterize each substance. In addition, the proposed model compares favorably with the modified Rackett and the Hankinson-Thomson correlations with the added advantages of covering the full saturation range and obeying scaling-law behavior in the near-critical region. Although the approach is essentially empirical, the results obtained suggest an underlying physical significance for the model parameters and show an excellent potential for generalized predictions. This is demonstrated by the results given here for saturated liquid densities where fully generalized predictions yield average errors of less than 1.0%.

6191 (DOE/PC/90523–T8) **Phase equilibrium data for development of correlations for coal fluids: Final report, 15 September 1986–15 September 1990.** Robinson, R.L. Jr.; Gasem, K.A.M.; Darwish, N.A.; Raff, A.M. Oklahoma State Univ., Stillwater, OK (United States). School of Chemical Engineering. 1 Feb 1991. 99p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-86PC90523. Order Number DE92001656. Source: OSTI; NTIS; GPO Dep.

The overall objective of the authors' work is to develop accurate predictive methods for representations of vapor-liquid equilibria in systems encountered in coal-conversion processes. The objectives pursued in the present project include: (1) Measurements of binary vapor-liquid phase behavior data for selected solute gases (e.g., C_2H_6, CH_4) in a series of paraffinic, naphthenic, and aromatic hydrocarbon solvents to permit evaluations of interaction parameters in models for phase behavior. Solubilities of the gases in the liquid phase have been determined. (2) Evaluation of existing equations of state and other models for representations of phase behavior in systems of the type studied experimentally; development of new correlation frameworks as needed. (3) Generalization of the interaction parameters for the solutes studied to a wide spectrum of heavy solvents; presentation of final results in formats useful in the design/optimization of coal liquefaction processes.

6192 (DOE/PC/90523–T9) **Phase behavior of coal fluids: Data for correlation development: Report for the period October 15, 1989–January 15, 1990.** Robinson, R.L. Jr. Oklahoma State Univ., Stillwater, OK (United States). School of Chemical Engineering. 6 Feb 1990. 36p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-86PC90523. Order Number DE92004322. Source: OSTI; NTIS; GPO Dep.

The effective design and operation of processes for conversion of coal to fluid fuels requires accurate knowledge of the phase behavior of the fluid mixtures encountered in the conversion process. Multiple phases are present in essentially all stages of feed preparation, conversion reactions and product separation; thus, knowledge of the behavior of these multiple phases is important in each step. The overall objective of the author's work is to develop accurate predictive methods for representation of vapor-liquid equilibria in systems encountered in coal conversion processes. 59 refs., 6 figs., 7 tabs.

6193 (DOE/PC/91026–T2) **The dual role of oxygen functions in coal pretreatment and liquefaction: Crosslinking and cleavage reactions: Second quarterly report, July 1, 1991–September 30, 1991.** Serio, M.A.; Kroo, E.; Teng, Hsisheng; Charpenay, S.; Solomon, P.R. Advanced Fuel Research, Inc., East Hartford, CT (United States). [1991]. 8p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-91PC91026. Order Number DE92004911. Source: OSTI; NTIS; GPO Dep.

One objective of this program is to prepare polymer models having phenolic, carboxylic, and/or aryl ether groups considered to be important in low rank coals. In order to study the chemistry of these functional groups in a polymeric matrix, it is necessary that the polymer backbone itself should not be subject to cleavage under the reaction conditions. It is expected that poly(phenylene) would fulfill this requirement as a backbone, while providing simple mechanical routes for attaching other functional groups. During this reporting period, the synthesis of oligomeric species such as sexi(phenylene) and octa(phenylene) was explored. The procedure of Bamfield and Quam was followed, which involves heating a paste of bromoarenes, water, sodium formate and Pd/C. The reaction products turned out to be very insoluble and difficult to purify. The insolubility of these products makes them difficult to work with, and it is doubtful that we will be able to prepare well-characterized polymers in the 10,000 Da range. We are presently considering other polymeric substrates that might serve as the backbone. Pending the resolution of the polymeric substrate issue, the thermal behavior of the carboxyl and phenolic functions and the effect of ion-exchange will be studied using monomeric models. These studies will be needed to establish the baseline for considering the effect of the polymeric environment.

6194 (ORNL–6650) **Fossil Energy Program semiannual progress report, April 1990– September 1990.** Judkins, R.R. Oak Ridge National Lab., TN (United States). Sep 1991. 143p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC05-84OR21400. Order Number DE92004596. Source: OSTI; NTIS; GPO Dep.

This report covers progress made during the period April 1, 1990, through September 30, 1990, for research and development projects that contribute to the advancement of various fossil energy technologies. Topics discussed include: ceramics and composite materials R&D, new alloys, corrosion and erosion research, coal conversion development, mild gasification. (VC)

6195 **Process and apparatus for coal hydrogenation.** Ruether, J.A.; Simpson, T.B. To Dept. of Energy. 1990. Filed date 10 Apr 1990. USA Patent patent application 7-506,739. 17p. Sponsored by U.S. DOE Fossil Energy. Order Number DE92003874. Source: OSTI; NTIS; GPO Dep.

In a coal liquefaction process an aqueous slurry of coal is prepared containing a dissolved liquefaction catalyst. A small quantity of oil is added to the slurry and then coal-oil agglomerates are prepared by agitation of the slurry at atmospheric pressure. The resulting mixture is drained of excess water and dried at atmospheric pressure leaving catalyst deposited on the agglomerates. The agglomerates then are fed to an extrusion device where they are formed into a continuous ribbon of extrudate and fed into a hydrogenation reactor at elevated pressure and temperature. The catalytic hydrogenation converts the extrudate primarily to liquid hydrocarbons in the reactor. The liquid drained in recovering the agglomerates is recycled. 1 fig.

6196 Improved catalysts and method. Taylor, C.E.; Noceti, R.P. To Dept. of Energy. 1990. Filed date 30 Apr 1990. USA Patent patent application 7-516,611. 28p. Sponsored by U.S. DOE Fossil Energy. Order Number DE92004610. Source: OSTI; NTIS; GPO Dep.

An improved catalyst and method for the oxyhydrochlorination of methane is disclosed. The catalyst includes a pyrogenic porous support on which is layered as active material, cobalt chloride in major proportion, and minor proportions of an alkali metal chloride and of a rare earth chloride. On contact of the catalyst with a gas flow of methane, HCl and oxygen, more than 60% of the methane is converted and of that converted more than 40% occurs as monochloromethane. Advantageously, the monochloromethane can be used to produce gasoline boiling range hydrocarbons with the recycle of HCl for further reaction. This catalyst is also of value for the production of formic acid as are analogous catalysts with lead, silver or nickel chlorides substituted for the cobalt chloride. 8 figs., 3 tabs.

6197 Method for dispersing catalyst onto particulate material. Utz, B.R.; Cugini, A.V. To Dept. of Energy. 1990. Filed date 1 Jun 1990. USA Patent patent application 7-531,722. 19p. Sponsored by U.S. DOE Fossil Energy. Order Number DE92003741. Source: OSTI; NTIS; GPO Dep.

A method for dispersing finely divided catalyst precursors onto the surface of coal or other particulate material includes the steps of forming a wet paste mixture of the particulate material and a liquid solution containing a dissolved transition metal salt, for instance a solution of ferric nitrate. The wet paste mixture is in a state of incipient wetness with all of this solution adsorbed onto the surfaces of the particulate material without the presence of free moisture. On adding a precipitating agent such as ammonia, a catalyst precursor such as hydrated iron oxide is deposited on the surfaces of the coal. The catalyst is activated by converting it to the sulfide form for the hydrogenation or direct liquefaction of the coal. 2 figs., 1 tab.

6198 Method and apparatus for hot-gas desulfurization of fuel gases. Bissett, L.A. To Dept. of Energy. 1990. Filed date 31 Jul 1990. USA Patent patent application 7-560,666. 24p. Sponsored by U.S. DOE Fossil Energy. Order Number DE92003827. Source: OSTI; NTIS; GPO Dep.

The present invention is directed to a method and apparatus for removing sulfur values from a hot fuel gas stream in a fluidized bed contactor containing particulate sorbent material by employing a riser tube regeneration arrangement. Sulfur-laden sorbent is continuously removed from the fluidized bed through a stand pipe to the riser tube and is rapidly regenerated in the riser tube during transport of the sorbent therethrough by employing an oxygen-containing sorbent regenerating gas stream. The riser tube extends from a location below the fluidized bed to an elevation above the fluidized bed where a gas-solid separating mechanism is utilized to separate the regenerated particulate sorbent from the regeneration gases and reaction gases so that the regenerated sorbent can be returned to the fluidized bed for reuse. 3 figs., 1 tab.

6199 (CONF-910571–, pp. 186-198) **Determination and nature of water in low rank coals.** Lynch, L.J. (CSIRO Div. of Coal and Energy Technology, North Ryde (Australia)); Barton, W.A.; Webster, D.S. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The nature of water associated with coal is discussed and the concept of interacting water considered. Adopting a definition for interacting water as that having properties modified from those of bulk water, the criterion for its assessment is that it does not fuse near 273 K. It is recognized that the modification of interfacial water is a consequence of water-coal molecular interaction and that a further consequence of these interactions is likely to be some modification to the molecular properties of the coal itself. A refined method based on proton nuclear magnetic resonance (^{1}H NMR) measurements is described for characterizing water-substrate systems and in so doing accurately determining the saturation water content or maximum water binding capacity of the substrate. The method also provides useful data on the extent to which the substrate molecular structure is destabilized or plasticized by its exposure to water. The procedure is successfully applied to a high inertinite coal with high affinity for water.

6200 (CONF-910571–, pp. 199-215) **Digital scanning electron microscopy techniques for the characterization of coal minerals and coal ash.** Steadman, E.N. (Univ. of North Dakota, Grand Forks (United States)); Benson, S.A.; Zygarlicke, C.J. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The transformations of inorganic coal constituents which lead to ash deposition in combustion systems are extremely complex. Over the course of the past several years, significant advancements have been made in the understanding of ash formation and deposition that have aided in developing advanced methods of prediction. This has been the result of the application of computer-controlled deposits. The CCSEM technique is a significant advancement over currently used ASTM methods since it determines the size, association, and composition of mineral components in coal. Because of the growing acceptance and widespread use of CCSEM by the coal combustion community, an effort is being made for standardization. Researchers at the Energy and Environmental Research Center (EERC) of the University of North Dakota are presently working toward standardization and, ultimately, ASTM acceptance of the method. In addition, the development of advanced computerized methods to predict ash behavior in combustion systems utilizes CCSEM and other techniques to characterize the coal and coal ashes. This paper describes the methods used at EERC for characterization of the materials involved in ash deposition. Data produced by these techniques have provided insight into the intricate mechanisms of ash-deposit formation. The results and interpretations made from these techniques are compared to those based on ASTM ash analysis in order to demonstrate the utility of the techniques used at EERC.

6201 (CONF-910571–, pp. 501-510) **Use of on-line analyzers for sodium determination in lignite.** Devins, D.W. (Scan Technologies, Inc., York, PA (United States)). North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

It is well known that high sodium levels in carbonaceous fuels produce significant fouling problems in utility boilers. The method currently used to insure a low sodium feed is to blend carefully fuels from several different sources for which the sodium content is known from core samples or historical information. This paper describes measurements made with an on-line nuclear analyzer to determine the feasibility of measuring the sodium content of a North Dakota lignite in a timely fashion. The results indicate that a fifteen minute measurement time is sufficient to characterize the sodium content quite well. The range of sodium in the lignite was from 0.21 to 11.18% in ash. The ash range was 5.09 to 9.90% as received. For 22 samples the analyzer achieved a standard error of 0.055% Na_2O in coal and 0.63% Na_2O in ash.

6202 (CONF-910571–, pp. 511-534) **Characterization of hydrothermally and evaporatively dried coals and char products from Usibelli subbituminous 'C' coals.** Rao, P.D. (Univ. of Alaska, Fairbanks (United States)); Walsh, D.E.; Willson, W.; Li, Y.F. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The Mineral Industry Research Laboratory's (MIRL) near term goals for this project, which has now been completed, were (1) develop data on the responses of Alaskan coals to advanced drying/pyrolysis processes; (2) assess the stability of the dried/pyrolyzed products towards moisture readsorption, fines production and oxidation (an estimation of reactivity and tendency for spontaneous combustion) as a function of the process and operating parameters; and (3) reassess transportation requirements and costs based on altered coal properties. The candidate coal for this test work was subbituminous 'C' coal from the Usibelli Coal Mine, Healy, Alaska; chosen due to existing domestic and export markets, its environmental quality, and its association with Alaska's developed transportation infrastructure. Two high temperature drying/pyrolysis processes and one hydrothermal process were investigated: the Western Research Institute process; the Coal Technology Corporation process; and the Hydrothermal Drying process, or Hot Water Drying.

6203 (CONF-9106303–, pp. 1-2) **Coalification by clay-catalyzed oligomerization of plant monomers.** Orchin, M. (Univ. of Cincinnati, OH (United States)); Wilson, R.M. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88931. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to demonstrate that structures shown to be characteristic of low rank coals can be generated from C_3-C_6 units (e.g., essential plant oils, etc.) by radical-cation and acid catalyzed reactions promoted by smectic clays such as montmorillonite. It has been demonstrated that polycyclic compounds and several naturally occurring and important lignan structures (e.g. galbulin and podophylloyoxin) can be generated from C_3-C_6 precursors such as eugenol, isoeugenol, and cinnamates. The work may shed considerable light on the biogeogenesis of low rang coals. There is increasing evidence that coal has a macromolecular structure. It is useful therefore to (1) identify possible monomeric units (2) demonstrate the kinds of organic chemical reactions that convert these monomers to polycyclic oligomers (3) identify possible naturally occurring catalysts that may be responsible for such reactions. Finally if one can understand the nature of the oligomerization it is possible to find new ways of depolymerizing the coal macromolecule.

6204 (CONF-9106303–, pp. 3-6) **Spin-mapping of coal structures with ESE and ENDOR.** Belford, R.L. (Univ. of Illinois, Urbana (United States)); Clarkson, R.B. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88921. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The goal of this work is to develop nondestructive methods to determine the atomic and molecular structures present in the organic (maceral) components of whole coal and coal products. Through work on model compounds such as benzothiophene, dibenzothiophene and thianthrene, the authors have developed an interpretation for the ENDOR spectra of heteroatomic conjugated aromatic radicals including both the g-anisotropy and hyperfine interactions. This analysis makes use of the concept of orientation selection in the ENDOR spectra, and applies the 2-dimensional ENDOR technique with simulation analysis to disordered aromatic systems. Finally, the authors have started two exploratory extensions - (1) the combination of high-frequency EPR and ENDOR and the utility of this combination for the study of fossil fuels, and (2) the use of ESE-determined relaxation times and EPR-determined signal strengths, linewidths, and line shapes to study surface properties of coals and chars, in particular their response to oxygen.

6205 (CONF-9106303–, pp. 7-8) **^{31}P NMR analysis of coal moieties bearing -OH, -NH and -SH functions.** Verkade, J.G. (Iowa State Univ., Ames (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88923. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to develop heteronuclear NMR reagents for the identification and quantitation of labile hydrogen functional groups in liquid and solid coal materials. Two chlorophospholanes, $ClP(OCMe_2)_2$ and $ClP(SCH_2)_2$ have been synthesized as ^{31}P-containing NMR reagents and the author has demonstrated them to be useful in the identification and quantitation of phenols in coal pyrolysates. A serendipitous discovery made during the course of this work led to the development of $Ph_2(O)PCl$ as an advantageous ^{31}P NMR tagging reagent for the analysis of moisture in coals (and other pyridine-extractable solids). A variety of ^{119}Sn NMR tagging reagents have been evaluated for their efficacy in identifying and quantitating labile hydrogen functional groups found in coal materials. While several of these reagents appear promising there is a persisting problem with concentration dependence of the ^{119}Sn chemical shifts of the derivatized species, owing to equilibria involving coordination of a solvent molecule to the tin (to render it five-coordinate) and dimerization of the derivatized species. The author anticipates that this problem will be solved by the robustly chelated five-coordinate tin reagent shown which he has recently synthesized. Since platinum(II) readily coordinates organosulfur molecules, complexes of this metal ion are being investigated for their utility in identifying organosulfur forms in coal materials.

6206 (CONF-9106303–, pp. 9-11) **Formation and retention of methane in coal.** Hucka, V.J. (Univ. of Utah, Salt Lake City (United States)); Bodily, D.M. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88939. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The methane content of coal seams in Utah and Colorado will be measured in situ as well as in the laboratory and correlated with the geological and geochemical history of the seams and surrounding strata. Chemical and physical properties will be measured in the laboratory for coals that contain methane and coals of similar rank which do not contain methane. Methane yields on pyrolysis will be used to measure the propensity of coals to form additional methane. Methane formation and retention will be interpreted in terms of the physical and chemical properties of the coal and the chemical and geological history of the coal seam. Eleven coal samples have been collected, 8 from the Book Cliffs and 2 from the Wasatch Plateau fields of Utah and 1 from Colorado. All of the samples come from gassy seams, except for the two from the Wasatch Plateau field. Ultimate, proximate and other analysis has been performed for each of these coals. Helium densities were also measured. Permeabilities have been measured for selected samples. Dipolar dephasing carbon-13 nuclear magnetic resonance spectroscopy measurements have been performed on each of these samples. Types of aliphatic and aromatic carbons were determined for each sample. The coal samples have been pyrolyzed at 12C/min up to 900C to determine the propensity for additional methane formation. The formation of carbon dioxide, carbon monoxide, hydrogen, ethane and ethylene were also measured during pyrolysis. This study will provide information on the interaction of methane and coal that will be useful in the design of methane recovery schemes.

6207 (CONF-9106303–, pp. 12-13) **Permeability changes in coal resulting from gas desorption.** Levine, J.R. (Univ. of Alabama, Tuscaloosa (United States)); Johnson, P.M. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89764. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The principal objective of this research is to test the hypothesis that volumetric shrinkage of coal during desorption of occluded gases (particularly CH_4) can result in a net increase in the permeability through natural fractures underground. Testing of this hypothesis for a variety of US coal basins involves four tasks: (1) characterization of coal composition, (2) estimation of mechanical strength and elasticity, (3) measurement of sorption/desorption isotherms, and (4) determination of volume changes during sorption/desorption. Samples have been collected at field localities in Illinois basin (Illinois), Black Warrior basin (Alabama), and San Juan basin (Colorado). Additional coals selected from the DESC sample bank at Penn State, represent the Northern and Central Appalachian basins. Specimen preparation procedures involve slabbing, polishing, and grinding to provide suitable representative samples controlling for variations in petrographic composition. A high pressure microbalance sorption apparatus has been assembled to precisely measure weight changes of coal during gas sorption. The present configuration is capable of 1,200 psi and allows resolution of weight changes as small as 1 microgram on a sample as large as 100 mg. Measurement noise arises from turbulence, due in part to adiabatic heating or cooling of gas during changes in pressure. Sorption-related swelling and shrinkage is being measured with strain gages affixed to thin wafers of coal. Preliminary results show that sorption capacity and swelling both decrease with rank, passing through a minimum around high volatile A bituminous rank, before increasing again.

6208 (CONF-9106303–, pp. 14-15) **Basic properties of coals and other solids.** Arnett, E.M. (Duke Univ., Durham, NC (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89780. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to make a rigorous thermodynamic evaluation of the physical/chemical interactions of a variety of acids with several clearly defined solid bases as a means towards characterizing complex solids such as coals in terms of their acid-base properties. The first eighteen months of the project have concentrated on interactions of the following solids with a variety of acids covering a wide range of strengths from acetic to trifluoromethanesulfonic acid and also boron trichloride. Slurries of polyvinylpyridine in acetonitrile were compared with corresponding solutions of pyridine as a homogeneous analog. An excellent correlation of the heats of interaction for the two systems with thirteen of the acids described above demonstrated the feasibility of comparing solid bases with carefully chosen homogeneous analogs. An attempt to study the behavior of silica as a solid base through its interaction with the above series of acids led to the unexpected and surprising conclusion that silica is such a powerful hydrogen bond donor that it actually interacts with the whole series of carboxylic and sulfonic acid resins as though they were bases. With this background the heats of interaction of samples of Exxon Rawhide subbituminous coal and Illinois #6 subbituminous (Argonne Coal Bank) were compared using twelve carboxylic and sulfonic acids. Although no general correlation was obtained, fairly good correlations were found for the interactions of a series of aliphatic acids, and another for a series of aromatic acids implying differential behavior involving π-π interactions. Again good correlations were found between the behavior of the acids with polyvinylpyridine and with the two coal systems.

6209 (CONF-9106303–, pp. 20) **Novel technique for coal pyrolysis and hydrogenation product analysis.** Pfefferle, L.D. (Yale Univ., New Haven, CT (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89767. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The overall objective of this study is to establish vacuum ultraviolet photoionization-MS and VUV pulsed EI-MS as useful tools for a simpler and more accurate direct mass spectrometric measurement of a broad range of hydrocarbon compounds in complex mixtures for ultimate application to the study of the kinetics of coal hydrogenation and pyrolysis processes. The VUV-MS technique allows ionization of a broad range of species with minimal fragmentation. Many compounds of interest can be detected with the 118 nm wavelength, but additional compound selectivity is achievable by tuning the wavelength of the photo-ionization source in the VUV. The microjet reactor coupled to a VUV photoionization time-of-flight mass spectrometer has been used to obtain species measurements for high temperature pyrolysis of ethyl acetylene, butadiene, cyclohexane, benzene and toluene. Using this technique, intermediate species profiles of both stable and labile product masses were obtained for analysis of the pyrolysis pathway. Fragmentation was minimized due to the nature of the ionization, yielding predominantly molecular ions. This allows the study of reaction pathways in complex high temperature systems where both sampling and detection challenges are severe. This was true even for the worst case of cyclohexane where fragmentation of the parent fuel was appreciable. In the presentation the author discusses the results from benzene and cyclohexane pyrolysis and the work with development of correlations for VUV photoionization yields based on PES data.

6210 (CONF-9106303–, pp. 21-22) **Molecular accessibility in solvent swelled coal.** Kispert, L.D. (Univ. of Alabama, Tuscaloosa (United States)); Spears, R.; Piekara-Sady, L. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90284. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

It is the objective of this research to determine catalyst accessibility in Argonne Premium Coal Samples (APCS) upon swelling in polar, basic solvents before and after moisture loss. This can be obtained using an EPR technique that the authors have developed involving various nitroxide spin probes of different shapes or sizes diffused into coal samples. The results are consistent with SANS, DRIFT and NMR relaxation measurements of pore structure as a function of swelling solvents. The advantage of the EPR method is that it permits molecules of selected shape and size to be used as probes of accessible regions of the coal, thus providing information on the importance of molecular shape. The conversion of coal by an economically feasible catalytic method requires the catalyst to diffuse into the coal sample so that hydrogenation catalysis can occur from within as well as the normal surface catalysis. Thus an estimate of the size and shape of the pores in the coal before and after swelling with different solvents is needed so that an optimum sized catalyst will be used. The use of nitroxide spin probes with swelling solvents is a simple way in which to gain an understanding of the pore structure of coals and how it changes in the presence of swelling solvents. Coal contains significant quantities of spherically shaped pores increasing with decreasing rank. If coal is mildly swelled with nitrobenzene, the number of spherically shaped pores increases. A ssolvent polarity increases, such as with pyridine or as swelling temperature increases pores become elongated as evidenced by a decrease in the number of spherically shaped pores and a similar increase in the number of elongated pores. Finally, regardless of the swelling conditions, the pore structure of high rank coals changes very little.

6211 (CONF-9106303–, pp. 23-24) **Advanced NMR approaches in the characterization of coal.** Maciel, G.E. (Colorado State Univ., Fort Collins (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90290. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The analytical characteristics of the three Argonne Premium coals 801, 601 and 501 have been examined by magic-angle spinning (MAS) ^{13}C NMR, using large samples (2.5 cm^3). This study was based on experiments with ^{13}C magnetization generated by both cross polarization (CP) and by 90° single-pulse (SP) approaches. Various ^{13}C-based relaxation measurements were made. Using the Delrin ^{13}C signal of the Delrin/zirconia spinner as a built-in intensity reference, spin counting was carried out. It was determined that the single-pulse magic-angle spinning (SP-MAS) ^{13}C approach accounts for about 80%, and that the customery cross-polarization magic-angle spinning (CP-MAS) technique accounts for only about 50% of the carbon known to be in each sample; however, a CP-MAS approach that incorporates a better $T_{1\rho}^{H}$ determination accounts for more than 80% of the carbons. Dipolar-dephasing ^{13}C NMR studies provide a measure of the contributions of proton-bearing and non-proton-bearing carbons in the three coals and the fraction of aroamtic or aliphatic carbons that are proton-bearing. The attractiveness and utility of large-volume ^{13}C MAS approaches in the analysis of coal are demonstrated. Although useful results can be obtained via ^{13}C CP-MAS experiments (if one carries out the proper characterization of CP dynamics), the SP-MAS approach with large samples is more straightforward.

6212 (CONF-9106303–, pp. 41-42) **A new model of coal-water interactions and relevance for dewatering.** Suuberg, E.M. (Brown Univ., Providence, RI (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90308. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objectives are to (1) develop a quantitative theory of moisture retention in coal, based upon solvent swelling theory and (2) use this understanding to design new coal dewatering strategies. The principal accomplishment at this early stage of the project has been the completion of the review of swelling mechanisms of coals in the presence of specifically interacting solvents. The author feels that a new, fundamentally sound understanding of these swelling phenomena has been developed, one that challenges a significant number of earlier theories of moisture retention in coals as well as theories of organic solvent swelling of coals.

6213 (CONF-9106303–, pp. 43-44) **Oxidation of coal and coal pyrite: Mechanisms and influence on surface characteristics.** Doyle, F.M. (Univ. of California, Berkeley (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90287. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective of this research is to develop a mechanistic understanding of the oxidation of coal and coal pyrite, and to correlate the intrinsic physical and chemical properties of these minerals, along with changes resulting from oxidation, with those surface properties that influence the behavior in physical coal cleaning processes. The results will provide fundamental insight into oxidation, in terms of the bulk and surface chemistry, the microstructure, and the semiconductor properties of the pyrite. Preliminary work has been done on Illinois No. 6 coal, to learn standard preparation methods and analytical techniques (crushing, grinding, sizing, storage, proximate, ultimate and sulfur analysis), to ensure that the studies are directly comparable with others. The coal has been characterized by Fourier transform infrared spectroscopy, using a reflectance cell, BET analysis and electrochemical methods, to master these techniques. Dry thermal oxdiation tests, and wet oxidation with hydrogen peroxide and aqueous ferric chloride have been done.

6214 (CONF-9106303–, pp. 45-46) **Pyrite surface characterization and control for advanced fine coal desulfurization technologies.** Xianghuai Wang (Univ. of Kentucky, Lexington (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90295. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective of this project is to conduct extensive studies on the surface reactivity of pyrite by using electrochemical, surface spectroscopic analysis, potentiometric and calorimetric titration, and surface hydrophobicity characterization techniques and to correlate the alteration of the coal-pyrite surface with the efficiency of pyrite rejection by flotation and oil agglomeration. The products as well as their structures, the mechanism and the kinetics of the oxidation of coal-pyrite surfaces and interactions with various chemical reagents will be systematically studied and compared with that of mineral-pyrite and synthetic pure pyrite to determine the correlation between the surface properties and the bulk physical and chemical properties and impurities. Methods and types of coal being used in the study are described. Results to date are discussed.

6215 (CONF-9106303–, pp. 47-48) **A rheometer for measuring the material moduli for granular solids.** Rajagopal, K.R. (Univ. of Pittsburgh, PA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90306. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The authors have proposed building an orthogonal rheometer which consists of two disks rotating with the same angular speed about distinct axes. By measuring the forces and the torque acting on the top and bottom disks and correlating them with the theoretical expressions for the tractions and moment they can characterize the properties of the material that is placed between the disks. The device when built will be able to characterize the material properties of granular materials like coal and also coal slurries. Understanding the properties of such materials will go a long way in the design of bins, hoppers, silos, hydrocyclones and combustors, and in improving their reliability and performance.

6216 (CONF-9106303–, pp. 51-52) **Effects of light metal compounds on coal and carbon gasification.** Low, M.J.D. (New York Univ., NY (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to obtain direct information by infrared spectroscopy about the functional groups present when coals are pyrolyzed and oxidized, and specifically how light metal compounds affect these processes. The pyrolyses of model materials (cellulose, lignin and sucrose) and of three different coals, the oxidations of the pyrolyzates, and the effects of sodium and potassium salts on these processes, have been studied in detail. Potassium has a profound effect on the conversion mechanisms. Infrared Fourier transform photothermal beam spectroscopy has been successfully applied to the study of coals. The series of spectra of sodium- or potassium-impregnated coals provide detailed information about functional groups which are present, formed, and/or altered during coal pyrolysis and oxidation.

6217 (CONF-9106303–, pp. 16-17) **Single electron chemistry of coals.** Larsen, J.W. (Lehigh Univ., Bethlehem, PA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

There are two objectives concerning the native free radicals in coal. They are: (1) to determine whether the native free radicals in the Argonne coals are sufficiently reactive to initiate the polymerization of 4-vinyl pyridine; (2) to attempt to remove the native radicals from coal by their reaction with N, N′-Diphenyl-p-phenylene diamine (DPPD). Another objective, which does not involve coals native radicals, is to determine the ability of coals to participate in charge transfer interactions. This will be done by depositing tetracyanoquinodimethane (TCNQ) and tetracyanoethylene (TCE) in the coals and studying their IR spectra. The ESR spectra of the resulting coal-electron acceptor system will also be obtained and evaluated. Results to date are described for both studies. It has been demonstrated that the native free radicals in coal are essentially unreactive and need not be considered as active participants in most reactions of coals. Coals readily form extended electronic valence band structures when good electron acceptors are added.

6218 (CONF-9106303–, pp. 119-120) **Configurational diffusion of coal macromolecules.** Guin, J.A. (Auburn Univ., AL (United States)); Curtis, C.W.; Tarrer, A.R. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-86PC90504. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to learn more about how coal macromolecules, e.g., asphaltenes, diffuse through small pores. This diffusion rate is dependent on the molecule size, shape, and pore geometry. This problem has applications in catalysis. The bulk and effective diffusivities of coal macromolecules were measured using the diaphragm-cell technique with track-etched polyester membranes, and the relationship between effective diffusivities of coal macromolecules and pore size of a membrane was investigated, in order to obtain fundamental information concerning configurational diffusion phenomena occurring in coal liquefaction catalysts. The coal macromolecules were prepared from a sample collected from the deashed residue stream of the ROSE-SR unit at the Wilsonville coal liquefaction pilot plant (Wilsonville, Alabama), which was running Illinois No. 6 coal. The track-etched polyester membranes were prepared from irradiated polyester film using optimum etching conditions found in the current study. During the experiments, gel permeation chromatography was used to characterize the coal macromolecules and to analyze the diffusion experimental results. The experimental data were analyzed for six coal macromolecule fractions of narrow molecular size range, which were defined in the chromatogram.

6219 (CONF-9106303–, pp. 134-135) **Coal plasticity at high heating rates and temperatures.** Howard, J.B. (Massachusetts Inst. of Tech., Cambridge (United States)); Peters, W.A. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89773. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to obtain improved, quantitative understanding of the transient plasticity of softening coals under high heating rates and other reaction and pretreatment conditions of scientific and practical interest. To these ends, the softening and resolidification behavior of two US bituminous coals will be measured with a rapid-heating, fast response, high-temeprature coal plastometer. Apparent viscosity, softening temperature, plastic period, and resolidification time will be measured for molten coal as a function of independent variations in reaction conditions (e.g. temperature, heating rate). Intra-coal inventory and molecular weight distribution of pyridine extractables will also be measured using a rapid quench, electrical screen heater coal pyrolysis reactor. The yield of extractables is taken as representative of the intra-coal inventory of plasticing agent (metaplast) within the coal at the instand of quenching. Coal plasticity kinetics will be mathematically modeled from generation and depletion rates of extractables, by taking advantage of a correlation between the viscosity of a suspension and the concentration of deformable medium (here extractables) in that suspension.

6220 (CONF-9106303–, pp. 139-140) **Equilibrium and volumetric data and model development of coal fluids.** Robinson, R.L. Jr. (Oklahoma State Univ., Stillwater (United States)); Gasem, K.A.M. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90302. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The specific objectives of the work proposed herein include: development of an experimental facility having the capability to provide data on equilibrium phase compositions (solubilities) and liquid densities, and doing so with greater accuracy and speed than the authors' previous facility; measurement of equilibrium phase properties for systematically-selected mixtures - specifically those containing important solute gases (such as hydrogen, carbon monoxide, carbon dioxide, methane, ethane, carbonyl sulfide, ammonia) in a series of heavy paraffinic, naphthenic and aromatic solvents (e.g., n-decane, n-eicosane, n-triacontane, n-tetracontane; cyclohexane, decalin, perhydrophenanthrene, perhydropyrene; benzene, naphthalene, phenanthrene, pyrene); testing/development of correlation frameworks for representing the phase behavior of fluids of the type encountered in coal-conversion processes; and generalization of parameters in the correlation frameworks to enable accurate predictions for systems of the type studied, permitting predictions to be made for systems and conditions other than those for which experimental data are available. The ultimate goal of this work is to improve the abilities of predictive models for representation of vapor-liquid phase equilibria in mixtures typical of those encountered in production and processing of coal-derived fluids. Since accurate prediction of such phase behavior is critical to the design of all steps in the process in which multiple phases occur, adequate models for phase behavior predictions are of value in many process design and optimization calculations.

6221 (DOE/ET/10815–171) **A study of permeability and porosity in pulverized coal.** Pace, S.L. Jr.; Schmidt, H.J. Tennessee Univ., Tullahoma, TN (United States). Space Inst. Dec 1991. 52p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC02-79ET10815. (UTSI–91-03). Order Number DE92004039. Source: OSTI; NTIS; GPO Dep.

The purpose of this research was to experimentally investigate the relationship between porosity and permeability in pulverized coals. Permeability is defined as the ease with which a fluid passes through a porous medium and is a critical characteristic in the dense phase pneumatic transport of pulverized coal. Porosity is relative volume of the interparticle voids in comparison with the actual solid particulate volume. Porosity can be measured in both static and dynamic situations while permeability is measurable only in the static state and is dependent on particle size, size distribution, state of compaction and porosity. (VC)

6222 (DOE/PC/79925–T1) **Chemical characterization of the surface sites of coal: Final report.** Dwight, D.W.; Lloyd, T.B.; Riddle, F.L. Jr.; Cole, D.A. Lehigh Univ., Bethlehem, PA (United States). Dept. of Chemistry. Apr 1991. 41p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-87PC79925. Order Number DE92000037. Source: OSTI; NTIS; GPO Dep.

This report contains a method for determining the van der Waals and acid-base contributions to the overall ^{31}P chemical shifts ($\Delta\delta^d$ and $\Delta\delta^{ab}$) and to the Acceptor Numbers (AN^d and AN^{ab}) of the Meyer and Gutmann two-component systems, and to illustrate the method with experimental results for thirty-two liquids. 9 refs., 9 figs., 6 tabs.

6223 (DOE/PC/79929–13) **NO-char reactions: Kinetics and transport aspects: Final technical report.** Suuberg, E.M.; Calo, J.M.; Teng, Hsisheng; Lilly, W.D. Brown Univ., Providence, RI (United States). Div. of Engineering. Jul 1991. 215p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-87PC79929. Order Number DE91018978. Source: OSTI; NTIS; GPO Dep.

The reaction chemistry of NO with carbons is quite complex. This study details many different aspects of this chemistry. The choice was made to study the reaction chemistry using carbons derived from phenolic resins. These chars are microporous and have porosity characteristics similar to those of coal chars, but have the advantage that they are relatively free of potentially catalytic impurities. The results have been noted to be quite similar to results obtained on a variety of very different carbons, as reported in the literature. The reaction behavior was studied over a range of NO pressures up to 10.1kPa, and at temperatures between 323K and 1073K. The reaction behavior is an extremely sensitive function of temperature. 87 refs., 51 figs., 26 tabs. (VC)

6224 (DOE/PC/88921–8) **Spin-mapping of coal structures with ESE and ENDOR: Eighth quarterly (second annual) report.** Belford, R.L.; Clarkson, R.B. Illinois Univ., Urbana, IL (United States). 1 Sep 1990. 46p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88921. Order Number DE92004498. Source: OSTI; NTIS; GPO Dep.

A nondestructive method to determine the atomic and molecular structures present in the organic (maceral) components of whole coal and coal products has been sought for many years. This program of research is designed to address that analytical need by applying advanced electron magnetic resonance techniques to the determination of coal molecular structure. Structural information has be obtained by using the naturally occurring unpaired electrons in coal as "observation posts" from which to survey neighboring atoms through the electron-nuclear hyperfine interaction. Such an overall approach has been termed ELECTRON SPIN MAPPING of coal structure. New techniques like 2-dimensional ENDOR and ESE spectroscopies and multifrequency EPR, including the world's first S-band ESE spectrometer and one of the first W-band instruments, which we have developed in our laboratory, were employed in the determination. The materials studied were well separated macerals obtained by density gradient centrifugation techniques from Illinois #6 coals, a well as whole Illinois #6, #5, and Argonne Premium Sample Coals. model compounds, chosen to represent molecular structures typical of those believed to exist in coal also were studied by the various electron magnetic resonance (EMR) methods. Utilizing the various EMR methods available in our laboratory, we studied approaches to determine parameters that direcly reflect the atomic and molecular structure of coal. The naturally occurring unpaired electrons in coal were utilized as probes of their local environment, which they reflect through hyperfine interactions with neighboring $1 > 0$ nuclei (eg, ^{1}H, ^{13}C).

6225 (DOE/PC/88924–13) **Thermodynamics of the solvent swelling of coal: Final technical report, September 1, 1988–August 31, 1991.** Green, T.K. Western Kentucky Univ., Bowling Green, KY (United States). Center for Coal Science. 1991. 91p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88924. Order Number DE92005350. Source: OSTI; NTIS; GPO Dep.

The focus of this study was on the thermodynamics of the solvent swelling of coals. Specifically, a vapor pressure method was employed to evaluate Flory interaction parameters for coal-benzene systems. In addition, heats of dilution were determined for coal-pyridine systems using the same technique. The approach is unique in that coal extracts are the focus of the experiments, with the idea that more reliable thermodynamic information can be obtained on the uncrosslinked, soluble fraction of coal as opposed to the crosslinked, insoluble fraction. (VC)

6226 (DOE/PC/88939–14) **Methane formation and retention in coal: Quarterly technical progress report, July 1, 1991–September 30, 1991.** Hucka, V.J. Utah Univ., Salt Lake City, UT (United States). Dept. of Mining Engineering. [1991]. 28p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-88PC88939. Order Number DE92004524. Source: OSTI; NTIS; GPO Dep.

The methane content of coal seams in Utah and Colorado are measured in situ as well as in the laboratory and correlated with the geological and geochemical history of the seams and surrounding strata. Chemical and physical properties are measured in the laboratory for coals that contain methane and coals of similar rank which do not contain methane. Methane yields on pyrolysis are used to measure the propensity of coals to form additional methane. Methane formation and retention will be interpreted in terms of the physical and chemical properties of the coal and the chemical and geological history of the coal seam.

6227 (DOE/PC/89785–8) **The single electron chemistry of coals, July 1, 1991–September 30, 1991.** Larsen, J.W.; Eskay, T.P. Lehigh Univ., Bethlehem, PA (United States). Dept. of Chemistry. [1991]. 10p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-89PC89785. Order Number DE92004525. Source: OSTI; NTIS; GPO Dep.

The objectives of this work are to investigate and characterize the single electron reactions of alkyl and alkoxy aromatic compounds in order to determine the role these reactions play in the chemistry of coal. (1) Attempts will be made to demonstrate that the radicals from inertinite maceral group will initiate the polymerization of 4-vinylpyridine. (2) The molecule, N, N-diphenylphenylendiamine, will be deposited in coals to characterize their native free radicals. (3) Tetracyanoquinodimethane (TCNQ) and tetracyanoethylene (TCNE) will be used to characterize the numbers and strengths of single electron donors in coals.

6228 (DOE/PC/90176–T55) **Characterization of organic nitrogen in IBCSP coals: Final technical report, September 1, 1990–August 31, 1991.** Kruge, M.A. Southern Illinois Univ., Carbondale, IL (United States). Dept. of Geology. [1991]. 33p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004191. Source: OSTI; NTIS; GPO Dep.

The overall objective of this study was to determine the content and distribution of organic nitrogen in a series of IBCSP coals and their isolated macerals. The specific objectives were: to determine the bulk nitrogen contents for coals, isolated macerals, oxidation products and residues, solvent extracts and their liquid chromatographic fractions, and pyrolyzates; to determine the distribution of organic nitrogen in all coal derivatives enumerated in Objective 1 which are Gas Chromatography (GC)-amenable. This will be accomplished by GC-Thermionic Specific Detectors; to determine the molecular structure of the major nitrogen compounds detected in Objective 2, using mass spectrometry.

6229 (DOE/PC/90284–5) **Molecular accessibility in solvent swelled coal: Quarterly report, November 1991.** Kispert, L.D. Alabama Univ., University, AL (United States). Dept. of Chemistry. [1991]. 4p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90284. Order Number DE92004517. Source: OSTI; NTIS; GPO Dep.

The EPR-spin probe method was used to study the swelling of covalently cross-linked 2%, 4%, 6%, 8% and 12% polystyrene-divinyl benzene copolymers, used as models of APCS coal structural elements. The results were compared with swelling studies on APCS coals and confirmed results showing that coal was polymeric, that it had covalent cross-links increasing with rank, that it was structurally anisotropic, and that its swelling was anisotropic. The low temperature swelling of Argonne Premium Coal Samples using solvents of varying polarity was investigated. The variation in the shape of the pore was followed as a function of temperature and swelling solvent polarity. This change in pore structure was attributed to break-up of the hydrogen bonding network in coal by polar solvents. The modification in pore shape from spherical to cylindrical was attributed to anisotropy in hydrogen bond densities. The structural changes in coal pores that occur when APCS coal is dehydrated prior to swelling with polar solvents has been determined. These changes are different from those that occur in the absence of prior dehydration. Most impressive is the huge change that occurs in lignite coal (Beulah-Zap). It appears that this coal has collapsed upon dehydration preventing any spin probe from being trapped in the dehydrated lignite upon swelling. Various sized probes have been studied. A study on the variation in the hydrogen bonding character of the pore wall as the coals are swelled with various polar solvents has also been completed. A statistical analysis of the data has been completed to determine important trends in the data. 9 refs.

Argonne National Lab., IL (United States). [1991]. 15p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. (CONF-911226-1: SO_2 control symposium, Washington, DC (United States), 3-6 Dec 1991). Order Number DE92003419. Source: OSTI; NTIS; GPO Dep.

Integration of NO_x control into existing flue-gas desulfurization (FGD) systems addresses site-specific control requirements while minimizing retrofit difficulties. Argonne has studied the use of the metal-chelate additives, such as ferrous·EDTA in various wet FGD chemistries, to promote combined SO_2/NO_x scrubbing. A major process problem is oxidation of the iron to the ferric species, leading to a significant decrease in NO_x-removal capability. Argonne discovered a class of organic compounds that, when used with ferrous·EDTA in a sodium carbonate chemistry, could maintain high levels of NO_x removal. However, those antioxidant/reducing agents are not effective in a lime-based chemistry, and a broader investigation of antioxidants was initiated. This paper discusses results of that investigation, which found a practical antioxidant/reducing agent capable of maintaining NO_x removals of about 50% (compared with about 15% without the agent) in a lime-based FGD chemistry with FE(II)·EDTA. 5 refs., 10 figs.

6231 (CONF-910571-, pp. 155-171) **Recent developments in particulate control with low-rank fuels.** Miller, S.J. (Univ. of North Dakota, Grand Forks (United States)); Laudal, D.L. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

Regulations appear to be focusing on fine particle emissions rather than total mass particulate emissions. There is concern that electrostatic precipitators (ESPs) may not be able to meet potentially stricter finer particle emission standards. A new development in the area of fabric filtration is the use of flue gas-conditioning agents to reduce particulate emissions and pressure drop. Theoretical analysis of the factors that control the size of a baghouse indicates that pulse-jet baghouses can be designed to operate at much higher air-to-cloth ratios than is currently employed. To help optimize performance of both ESPs and baghouses, quantitative characterization of the cohesive properties of fly ash is necessary. Appropriate methods are determination of aerated and packed porosity and measurement of tensile strength as a function of porosity.

6232 (CONF-910571-, pp. 172-184) **Calcium duct injection technology for SO_2 control.** Claussen, R.L. (United Engineers and Constructors Inc., Denver, CO (United States)); Goffredi, R.A.; Martin, C.E. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

To promote the widespread use of coal in an environmentally and economically acceptable manner, the US Department of Energy sponsors a Flue Gas Cleanup Program to develop environmental control technology for coal-fired utility boilers. One of the largest research and development activities occurring in the SO_2 emission control area is the development of duct injection of calcium sorbents. Based on encouraging proof-of-concept test results, the Department of Energy-Pittsburgh Energy Technology Center has funded a multifaceted Duct Injection Technology Development Program. The goal of this program is to develop low-cost SO_2 emission control technology that can be installed on existing coal-fired power plants. Current work is concentrated on developing calcium duct injection technology by late 1992 suitable for retrofitting older plants that were built prior to promulgation of New Source Performance Standards in 1971. This paper reviews results to date under this program, summarizes work still to be done, and presents comparisons of calcium duct injection technology with other related FGD processes. A perspective on how duct injection technology might fit into acid rain compliance strategies is also presented.

6233 (CONF-910571-, pp. 272-283) **'Top-down' BACT analysis - Recommended approach and recent determinations.** Cochran, J.R. (Black and Veatch, Kansas City, MO (United States)); Fagan, M.E. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

New EPA requirements for 'top-down' best available control technology (BACT) analyses have resulted in determinations that require more stringent control technologies. Accordingly, these permit decisions include nitrogen oxide (NO_x), sulfur dioxide, and particulate emission limits significantly lower than applicable New Source Performance Standards. However, with careful consideration of acceptable site-specific impacts, obtaining a reasonable BACT determination is still possible. This paper presents a step-by-step approach for conducting a top-down BACT analysis, and summarizes important considerations that will lead to a more effective BACT analysis. In addition, recent permit decisions regarding NO_x emission rate and control technology requirements for combined cycle combustion turbine and coal fueled power plants are summarized and examined to ascertain the basis for decisions. Guidance from this paper will help applicants in preparing an accurate and comprehensive BACT analysis for their proposed projects.

6234 (CONF-9106303-, pp. 88-89) **Comparative study of the reactions of metal oxides with SO_2 and H_2S.** Sotirchos, S.V. (Univ. of Rochester, NY (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90301. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The primary objective of this project is the investigation of the effects of pore structure on the capacity of porous metal oxides for removal of gaseous pollutants from flue gases of power plants (SO_2) and hot coal gas (primarily H_2S). The experimental studies will include reactivity evolution studies and pore structure characterization using a variety of methods, and the work will focus on oxides that can react (sufficiently fast) both with SO_2 and H_2S. The author intends to appropriately exploit the differences of the sulfidation and sulfation reactions (for instance, different molar volumes of solid products) to elucidate the dependence of the sorptive capacity of a porous sorbent on its physical microstructure. Experiments have been carried out on the reactivity and pore structure evolution of CaO sorbents during reaction with H_2S. Various mathematical models for gas-solid reactions with solid product were used to theoretically investigate the reactions of limestone calcines with H_2S and zinc oxide sorbents with SO_2 on the basis of past experimental results for the sulfation and sulfidation, respectively, reactions of these sorbents. A detailed analysis of the problem of effective diffusivity measurement using the diffusion-cell method was carried out.

6235 (CONF-9106303–, pp. 143-144) **Plasma assisted NO_x reduction in existing coal combustors.** Yao, S.C. (Carnegie Mellon Univ., Pittsburgh, PA (United States)); Russell, T. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88932. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to explore the feasibility of using plasma produced chemical radicals to interact with the coal combustion processes to reduce NO_x emissions. A complete analysis of the chemical kinetics of ammonia and the radicals derivaties of ammonia has been performed. Additional species can favorably modify the kinetics to increase radical lifetimes and process efficiency. The chemical model is being altered to model the freezing the reactions by rapid expansion through a nozzle. Modeling of nitrogen plasma injection, unlike ammonia, has been shown to be ineffective chemically and energetically. CMU combustion facility modification has been completed and inductively coupled plasma system has been converted for the present application. A series of tests has been performed which have supported the computational results. Additional methods, and optimization of current methods, are being studied to increase process effectiveness. These results, which are supported by those found at the PETC facility, show that NO_x reduction by the injection of molecular radicals is effective. The reduction is less sensitive to combustion gas temperature and less susceptible to ammonia slip than thermal deNO_x.

6236 (CONF-9106303–, pp. 150-152) **Pulsed electron beam precharger.** Shelton, W.N. (Florida State Univ., Tallahassee (United States)); Finney, W.C. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89768. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The specific objective of the Pulsed Electron Beam Precharger project is to further develop the technology of efficiently collecting high resistivity fly ash using a two-stage system composed of an electron beam precharger coupled with an electrostatic precipitator. High resistivity fly ash, produced by burning low sulfur coal in power plant and industrial boilers, limits the operating parameters of conventional electrostatic precipitators by initiating debilitating back corona. If the particle charging and collecting functions are optimized separately in a two-stage configuration, higher removal efficiencies can be obtained and the back corona problem can largely be avoided. The process of electron beam ionization of air molecules produces a bipolar plasma of ions and electrons in the precharger. One monopolar fraction (usually negative) is used to charge the dust particles to very high levels nearing the saturation limit. After precharging, the aerosol is removed in a downstream electrostatic collector operated in a back corona-free electrical condition. The superior charging performance of electron beam prechargers is due to the combined effects of space charge enhancement of the charging electric field, and a much superior particle charging by available free electrons. Pulsed operation of the particle charging electric field is the subject of the present contract research. The advantage of pulsing the electric field lies in the fact that pulsed electric fields can be achieved which are much larger than the breakdown electric field for DC operation, provided that the pulse duration is sufficiently short (200 ns). The direct result is an increase in particle charge due to the increase in electric field during the pulse, and an enhancement of the charging field due to ionic space charge which would persist for some time after the pulse in the presence of a DC bias.

6237 (CONF-9106303–, pp. 153-154) **Binding and catalytic reduction of NO by transition metal aluminosilicates.** Klier, K. (Lehigh Univ., Bethlehem, PA (United States)); Herman, R.G. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89784. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to provide the scientific basis for processes that actively and selectively disproportionate or reduce NO in dilute exhaust streams, as well as in concentrated streams, to N_2. Experimental studies of NO chemistry in transition metal-containing aluminosilicate catalysts will be carried out with the aim of determining the patterns of reactivity in activating NO. Electronic and orbital calculations will be carried out to deduce the chemical rules for NO reduction on non-precious metals. Divalent transition metal exchanged A zeolite samples, including Co(II) exchanged A zeolites having 1.3 and 3.9 Co(II) ions per unit cell, as well as Fe(II), Mn(II), and Cu(II) A zeolites, have been prepared and characterized. A reaction system that is capable of being evacuated and containing an in situ diffuse reflectance cell and a quadrupole mass spectrometer has been assembled and is being used for the NO disproportionation and reduction studies that are being carried out with these zeolites. It has been demonstrated that the ion exchange process can be quantitatively monitored by HR-ESCA analysis. In addition, the valence band spectra, as well as HMO calculations, indicate that there is significant bonding overlap of the 3d orbitals of the Co ions with the zeolite O 2p-based lattice orbitals.

6238 (CONF-9106303–, pp. 155-157) **Molten iron oxysulfide as a superior sulfur sorbent.** Hepworth, M.T. (Univ. of Minnesota, Minneapolis (United States)); Reid, K.J. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89778. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to examine the thermodynamics and kinetics of the molten phase in the iron-oxygen-sulfur system to determine the optimum operating conditions to run a slagging-desulfurizing burner and to compare the potential for use of this system with lime-based systems for desulfurization. Slagging combustors with injected lime or limestone are being considered as replacements for conventional coal burners. They have advantages in that they can be staged to reduce NO_x and SO_x emissions. Iron oxide, as an alternative to lime or limestone may be effective not only as a desulfurizing agent, but under the right conditions of oxygen potential and after combination with sulfur, the reaction products of coal gases with iron oxide can act as a flux to produce a fluid phase. The thermodynamic conditions for determining the most effective operating conditions of the first stage of a combustor are calculated for several Illinois coals. The conditions which were studied this year include contact of a coal gas with the phase combinations $CaO/CaSO_4$, CaO/CaS, Fe/FeO/Liquid for the temepruture range of 950 to 1,300C.

6239 (CONF-9106303–, pp. 158-159) **Comparison of lime and iron oxide for high temperature sulfur removal.** Reid, K.J. (Univ. of Minnesota, Minneapolis (United States)); Hepworth, M.T. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89779. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to examine the sulfur removal behavior of both lime and iron oxide sorbents under carefully controlled sulfur and oxygen potentials in a novel double vortex combustor. If iron oxide can be substituted for lime in a multistage burner, then it may be possible to improve the degree of desulfurization which can be accomplished over that encountered with lime as a sorbent. At the same time, a low-melting point slag should be the product which has the potential to be less reactive to atmospheric conditions of water-leaching than calcium sulfide, which would be the product of lime-desulfurization under reducing conditions. A highly sophisticated second hand gas train control system and off gas treatment unit was acquired at a favorable cost and is now installed as part of the overall double vortex burner test rig. A glass burner model has been constructed and has provided many critical insights into flame stability and operating characteristics. A fine particle feeder system has been developed and calibrated for feeding fine taconite concentrate material.

6240 (CONF-9106303–, pp. 162-164) **Synergistic capture mechanisms for alkali and sulfur species from combustion.** Peterson, T.W. (Univ. of Arizona, Tucson (United States)); Shadman, F.; Wendt, J. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90285. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

It is proposed to conduct a systematic study to elucidate mechanisms governing both the effect of sulfur on the capture of alkali and trace metals on sorbents during combustion, and the converse effect of alkali/trace metals on the capture of sulfur. This study is motivated by existing data which indicate that the speciation of alkali compounds in the gas phase profoundly influences the mechanism of alkali capture on alumino-silicate sorbents, and by results from other laboratories demonstrating enhanced sulfur capture by lime contaminated by alkali or trace metals. The authors propose to utilize these synergistic mechanisms to develop novel bifunctional sorbents, suitable for the simultaneous capture of alkali/trace metals and sulfur during combustion. Such a dual sorbent might be bauxite or alumina impregnated with lime. The research involved bench scale experimental studies, laboratory combustor studies and theoretical modeling to relate the two. Bench scale experiments, utilizing a thermogravimetric furnace, focus on kinetics and mechanisms of alkali/trace metal interactions with individual sorbent flakes under simulated flue gas conditions. Laboratory combustor studies, utilizing a 17kW downflow combustor, focus on synergistic mechanisms as they occur in real, but well defined, combustion environments, with the sorbent in a disperse phase. Additional synergistic effects caused by combustion modifications for NO_x abatement will also be examined. In each case attention is centered on synergistic interactions during condensation and capture on sorbents. Results from this research should lead to novel 'designer' sorbents which will allow coal to be burned with minimum alkali/trace metal, sulfur and nitrogen oxide emissions.

6241 (CONF-9106303–, pp. 167-168) **Anion-exchange resin-based desulfurization process.** Sheth, A.C. (Univ. of Tennessee Space Inst., Tullahoma (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90309. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

From the economic and environmental viewpoints, it is necessary to regenerate (desulfurize) and recycle the spent alkali metal sorbents (mainly sulfates). The need for a simple, low-cost and readily acceptable sorbent regeneration option to desulfurize such alkali metal sulfates can be satisfied by the anion-exchange resin-based UTSI concept. To date in the project, the following activities have been carried out: completed computer-based literature search and acquired publications of interest; contacted resin manufacturers and suppliers and acquired samples of eleven candidate resins; developed an experimental screening procedure to evaluate candidate resins in relatively easy and quicker (than fixed bed mode) batch mode tests; prepared a schematic of the semi-automated fixed-bed unit and arranged (either salvaged or ordered) for the necessarry parts and components. Results to date are discussed.

6242 (DOE/PC/79861–T1) **Electric Power Research Institute, High-Sulfur Test Center report to the Steering Committee, July 1991.** Electric Power Research Inst., Palo Alto, CA (United States). [1991]. 73p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-87PC79861. Order Number DE92004309. Source: OSTI; NTIS; GPO Dep.

Operation and testing continued this month at the High Sulfur Test Center on the Pilot Wet Scrubber, Mini-Pilot Wet Scrubber and the Spray Dryer Systems. The Pilot continued testing under the High Performance test block program and the Mini-Pilot continued testing under the Formate Forced Oxidation test block. The HSSD testing to investigate the effects that ambient temperature and humidity have on SO_2 removal was completed. Dry alkaline injection testing was started to remove SO_3 and HCl from flue gas which removes visible plumes. Construction upgrades and system shakedown continued on the Cold-Side Selective Catalytic Reduction (SCR) system in preparation for start-up. (VC)

6243 (DOE/PC/81010–T1) **A 12-MW-scale pilot study of in-duct scrubbing (IDS) using a rotary atomizer.** Samuel, E.A.; Murphy, K.R.; Demian, A. General Electric Environmental Systems, Lebanon, PA (United States). Nov 1989. 231p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-85PC81010. Order Number DE92004183. Source: OSTI; NTIS; GPO Dep.

A low-cost, moderate-removal efficiency, flue gas desulfurization (FGD) technology was selected by the US Department of Energy for pilot demonstration in its Acid Rain Precursor Control Technology Initiative. The process, identified as In-Duct Scrubbing (IDS), applies rotary atomizer techniques developed for lime-based spray dryer FGD while utilizing existing flue gas ductwork and particulate collectors. IDS technology is anticipated to result in a dry desulfurization process with a moderate removal efficiency (50% or greater) for high-sulfur coal-fired boilers. The critical elements for successful application are: (1) adequate mixing of sorbent droplets with flue gas for efficient reaction contact, (2) sufficient residence time to produce a non-wetting product, and (3) appropriate ductwork cross-sectional area to prevent deposition of wet reaction products before particle drying is comple. The ductwork in many older plants, previously modified to meet 1970 Clean Air Act requirements for particulate control, usually meet these criteria. A 12 MW-scale IDS pilot plant was constructed at the Muskingum River Plant of the American Electric Power System. The pilot plant, which operates from a slipstrem attached to the air-preheater outlet duct from the Unit 5 boiler at the Muskingum River Plant (which burns about 4% sulfur coal), is equipped with three atomizer stations to test the IDS concept in vertical and horizontal configurations. In addition, the pilot plant is equipped to test the effect of injecting IDS off- product upstream of the atomizer, on $SO_2$and NO_x removals.

6244 (DOE/PC/88850–T5) **Fundamental investigation of Duct/ESP phenomena: 1.7 MW pilot parametric testing results: Topical report No. 2.** McGuire, L.M.; Brown, C.A. Radian Corp., Austin, TX (United States). 22 Jul 1991. 182p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88850. Order Number DE92002584. Source: OSTI; NTIS; GPO Dep.

Radian Corporation was contracted to investigate duct injection and electrostatic precipitator phenomena in a 1.7-MW pilot plant constructed for this test program. This study was an attempt to resolve previous problems and to answer remaining questions with the technology using an approach which concentrated on the fundamental mechanisms of the process. The goal of the study was to obtain a better understanding of the basic physical and chemical phenomena that control: (1) the desulfurization of flue gas by calcium-based reagent, and (2) the coupling of the duct injection process to an existing ESP particulate collection device. (VC)

6245 (DOE/PC/88852–T4) **Duct injection technology prototype development: Evaluation of engineering data: Topical report No. 2.** United Engineers and Constructors, Inc., Denver, CO (United States). Stearns-Roger Div. Jul 1990. 331p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88852. Order Number DE92002583. Source: OSTI; NTIS; GPO Dep.

The objective of the Duct Injection Technology Prototype Development Project is to develop a sound design basis for applying duct injection technology as a post-combustion SO_2emissions control method to existing coal-fired power plants. The necessary engineering design and scale-up criteria will be developed for the commercialization of duct injection technology for the control of

SO_2 emissions from coal-fired boilers in the utility industry. The primary focus of the analyses summarized in this Topical Report is the review of the known technical and economic information associated with duct injection technology. (VC)

6246 (DOE/PC/90544–T1) **Healy Clean Coal Project: Technical progress report, quarterly report No. 1 & 2 for the period January–June 1991.** Stone and Webster Engineering Corp., Denver, CO (United States). Sep 1991. 22p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC22-91PC90544. Order Number DE92002828. Source: OSTI; NTIS; GPO Dep.

The objective of the Healy Clean Coal Project is to demonstrate the integration of an advanced combustor and heat recovery system with both high and low temperature emission control processes. The resulting emission levels of SO_2, NO_x, and particulates are expected to be significantly better than the federal New Source Performance Standards. 3 figs. (VC)

6247 (Juel–2497) **Theoretical investigations on the behaviour of heavy metals in coal-fired power plants.** Angewandte Systemanalyse. Markewitz, P. Forschungszentrum Juelich GmbH (Germany). Programmgruppe Systemforschung und Technologische Entwicklung; Essen Univ. (Gesamthochschule) (Germany). Jul 1991. 186p. (In German). Order Number DE92750201. Source: OSTI; NTIS (US Sales Only).

This study is devoted to a theoretical analysis of the most important parameters having an influence on the trace element emissions from coal-fired power plants. To this end, the flue gas section in a coal-fired power plant is subdivided into the components combustion/boiler, electrostatic precipitator and flue gas desulphurization. These components are then analysed by different models. Besides the retaining of trace elements in ash or slag, especially their accumulation on fly ash particles and the impact on control technologies are analysed. Furthermore, the purification of boiler heating surfaces has been modelled and computations for the element arsenic have been performed. (orig.).

6248 (CONF-910571–, pp. 445-446) **Field study of wastes from fluidized-bed combustion technologies.** Weinberg, A. (Radian Corp., Austin, TX (United States)); Holcombe, L.; Butler, R. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The Department of Energy (DOE) has undertaken a research project to monitor advanced coal process wastes placed in natural geologic settings. The overall objective of the study is to gather field data on the engineering and environmental performance of disposed solid waste from various advanced coal processes. The coal ash from a fluidized-bed combustion unit is being studied as part of the DOE program. The unit is a 110-MW circulating fluidized bed (CFB) at Colorado Ute Electric Association's Nucla Steam Electric Station, which is being demonstrated with the support of the DOE Clean Coal Technology Program. The Electric Power Research Institute is cofunding the study. In June of 1989, a test cell approximately 100 feet square and 8 feet deep was constructed and filled with ash from the Colorado Ute CFB unit. The cell was instrumented with lysimeters and neutron probe access tubes to monitor water flow and leachate chemistry in the ash; groundwater wells and runoff collection devices were installed to determine the effects on groundwater and surface water quality, and a meteorological station was installed to determine the water balance. Additionally, tests are being performed to evaluate the chemical, physical, and mineralogical properties of the solid waste and geologic materials. Results from the first year of monitoring are presented.

6249 (CONF-9106303–, pp. 160-161) **Selenium transformation in coal mine spoils: Its environmental impact assessment.** Atalay, A. (Univ. of Oklahoma, Norman (United States)); Koll, K.J. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89782. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objectives are to develop an Ion Chromatograph procedure for analysis of selenium; to conduct field lysimetry study to monitor the transformation of selenium from coal mine spoils; and to assess the impact of selenium from coal mine spoils on the environment. The ion chromatograph procedure developed for measuring selenium from water samples was extended to look at selenium in soils and plant materials. The method was also useful in analyzing other anions such as arsenate, aresenite, nitrate, chloride, and sulfate. The Lysimetry set up can be used to study the redox chemistry of other metals in the aqueous soil environment. The environmental impact assessment conducted revealed that selenium and other mobile pollutants may not be a problem in older spoil sites that have equilibrated long enough.

6250 (ETDE/JP-mf–2749179) **Handbook of safety technology of coal mines. 1.: Gas-coal dust explosions.** Mining and Material Processing Inst. of Japan, Tokyo (Japan). Mar 1991 101p. (In Japanese). Order Number DE92749179. Source: OSTI; NTIS (US Sales Only).

Of safety technologies of coal mines summarized as a handbook, described is the safety technology on gas-coal dust explosions. Reaction process of the explosion is complicated, and for prevention of explosions, it is necessary not to make explosion limit concentration atmospheres of flammable gases (mostly methane) and coal dust and not to give ignition source energy to them. There are various ignition sources such as blasting, electric spark, static electricity, spontaneous fire, mine fire, friction spark. Ventilation is made as measures against methane gas. Measures against coal dust are prevention of coal dust production, cleaning and removal of sedimentary coal dust, inactivation of coal dust and removal of fire source causing explosion. Measures for prevention of explosion propagation are taken just in case of explosion: rock dust barrier, water barrier, auto water curtain, dense rock dust zones. Some explosion prevention technologies in site and some accidents happened are explained. Furthermore, safety standards are established according to mine safety laws and regulations. 69 refs., 49 figs., 20 tabs.

6251 (ETDE/JP-mf–2749180) **Handbook of safety technology of coal mines. 2.: Gas outburst-rock-burst.** Mining and Material Processing Inst. of Japan, Tokyo (Japan). Mar 1991 145p. (In Japanese). Order Number DE92749180. Source: OSTI; NTIS (US Sales Only).

Of safety technologies of coal mines summarized as a handbook, described is the safety technology on gas outburst-rock burst. The gas outburst is eruption of coal and gas, and indications of danger of the outburst are gas reserves, degrees of stress relaxation of the coal seam ground, etc. Measures against gas outburst are mainly stress relaxation and gas drainage. Measures for gas control are gas drainage made along the coal seam and made vertically through the coal seam, hydraulic fracturing and ground boring. Measures for rock pressure control are advanced drilling of a protective coal seam which is less dangerous from gas outburst, boring for stress relaxation and excavation of pressure release mine roadways. The rock burst is a phenomenon that coal and rocks bound out into the operation space by abrupt fracture of the rock mass caused by rock pressure. In addition to predictions by a geological structure survey and signs of talking and ground swelling, the following are taken up: wide-area control of coal seam rock pressure (improvement of mining methods, pressure release mine roadways), measures for coal seam strengthening (pressure release boring, pressure release blasting, pressure release water-pouring). Some coal mine accidents and prevention measures are explained. 127 refs., 130 figs., 22 tabs.

6252 (ETDE/JP-mf–2749183) **Handbook of safety technology of coal mines. 5.: Ventilation control.** Mining and Material Processing Inst. of Japan, Tokyo (Japan). Mar 1991 69p. (In Japanese). Order Number DE92749183. Source: OSTI; NTIS (US Sales Only).

Of safety technologies of coal mines summarized as a handbook, described is the safety technology on ventilation control. Factors in drawing up a plan for ventilation control are increasing due to the mine structure being deeper, more complicated and larger-sized, increasing gas emission and temperature rises of rock mass. Air flow rate and frictional resistance are calculated by measuring wind velocity, temperature, humidity and ventilating pressure. Various ventilation methods are devised according to the mine structure. Ventilation network of the mine consists of mine roadway, working face, air duct and clearance where leakage flows. The fire escape route must also be considered. The following factors for the ventilation plan should be considered: structure of the ventilation network, pressure loss, features of blowers, natural ventilation pressure, constant-flow airway where constant air flows, and leakage. As a theory of ventilation elucidation, a Hardy-Cross method and a panel point method, which are the succesive approximation method by computer, are explained showing calculation examples. 17 refs., 60 figs., 35 tabs.

6253 (ETDE/JP-mf–2749184) **Handbook of safety technology of coal mines. 6.: Thermal environmental control.** Mining and Material Processing Inst. of Japan, Tokyo (Japan). Mar 1991 55p. (In Japanese). Order Number DE92749184. Source: OSTI; NTIS (US Sales Only).

Of safety technologies of coal mines summarized as a handbook, described is the safety technology on thermal environmental control. Aggravation of the thermal environment at working faces affects health, safety and productivity. What controls capacity of heat dissipation from human body into the exterior is temperature, humidity and wind velocity, and besides, various thermal environment indices for increasing working efficiency are presented. As heat sources, geothermy, heat from machinery, air compression heat and others are cited. Measurements of rock mass temperature and air temperature? humidity and calculation methods of temperature?humidity of air flow are introduced. When the thermal environmental conditions become worse, increasing of air flow rate and mine cooling by refrigerator are usually conducted. However, the most reasonable measures should be taken in view of various points because they are closely related to cost, production and safety. The high temperature problem is apt to occur especially at working faces. Measures against hot water discharge are boring drain, grouting, etc. Cold water spray is also adopted to hot rock mass. Some examples of measures for thermal environmental control are explained. 6 refs., 56 figs., 16 tabs.

6254 (CONF-9108127–3) **Boundary conditions for granular flows at randomly fluctuating bumpy boundaries.** Richman, M.W. Worcester Polytechnic Inst., MA (United States). Dept. of Mechanical Engineering. [1991]. 13p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-91PC90185. From 2. U.S.-Japan seminar on micromechanics of granular materials; Syracuse, NY (United States); 4-10 Aug 1991. Order Number DE92004496. Source: OSTI; NTIS; GPO Dep.

In this paper we focus attention on the interactions between rapid flows of identical, smooth spheres that interact with bumpy boundaries through inelastic collisions. The boundaries translate with specified mean velocities, and deviate about the mean with specified fluctuation velocities. Based upon Maxwellian velocity distribution functions that describe the velocities of both the flow particles and boundaries, we calculate the rates at which linear momentum and kinetic energy are exchanged between the two. Using these exchange rates, we write down conditions that ensure that both momentum and energy are balanced at bumpy boundaries. Finally, we employ a constitutive theory that is consistent with these conditions to calculate the granular temperature and solid fraction profiles within a granular material confined between two parallel, bumpy surfaces that randomly fluctuate about zero mean velocity.

This paper summarizes the work sponsored by the Department of Energy (DOE) Morgantown Energy Technology Center (METC) and performed over the past five years aimed at the development of a direct fired, coal-fueled industrial gas turbine in the 3.5 to 5 MW class. Early development tests were performed using deeply cleaned (0.7% ash) bituminous coal-water-slurry (CWS) fuel. This fuel was chosen with the intent of minimizing ash deposition and turbine erosion problems while accepting a projected moderately higher fuel cost. Later, as component technology development improved, the opportunity was taken to explore a wide range of fuels including a subbituminous coal-slurry with increased ash content. The results of bench-scale combustor (6 MMbtu/hour heat input) testing of this fuel were so encouraging that additional tests were run on a full scale, 70 MMbtu/hour nominal heat input combustion system. As a result of these successes, proof-of-concept tests are now in progress using a 3.5 MW industrial gas turbine burning hot water dried subbituminous coal-water slurry supplied by the University of North Dakota Energy Research Center (UNDERC). These tests, and future plans to convert the fuel system to permit the feeding of dry coal, including a dried Powder River Basin coal, are described.

Project CFB was initiated in May 1988 under funding provided from the US Department of Energy (DOE), the Empire State Electric Energy Research Corporation (ESEERCO), Northern States Power Company (NSP), the Electric Power Research Institute (EPRI), Otter Tail Power Company, North Dakota Lignite Research Council, ARCO Coal Company, TU Electric, Consolidated Edison of New York, Premier Refractories and Chemicals, and the University of North Dakota Energy and Environmental Research Center (EERC). The overall goal of the project was to provide a technical basis for assessing the economic and environmental feasibility of circulating fluidized-bed combustion (CFBC) technology, focusing on the effect of system configuration and coal properties on performance. Other underlying goals of the program were to (1) design and construct a CFBC test facility, thereby providing a test facility at an independent laboratory, (2) demonstrate that the test unit is capable of meeting the original design objectives, and (3) assess the ability of the unit to provide scalable data.

6257 (CONF-9106303–, pp. 27-30) **Roles of additives and surface control in slurry atomization.** Tsai, S.C. (California State Univ., Long Beach (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract

FG22-88PC88912. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objectives are (1) to promote further understanding of the mechanisms and the roles of additives in airblast atomization of coal water slurry (CWS); (2) to investigate the impacts of coal particle surface properties and interparticle forces on CWS rheology. Micronized CWSs with flow behavior indices ranging from 0.7 (pseudoplastic) to 1.0 (Newtonian) have been prepared using anionic dispersant at concentrations ranging from 0.32 wt% to 1.35 wt% polymer (on a coal basis). The effect of particle size at similar size distributions on the relative viscosity of a pseudoplastic CWS can be approximated by particle Peclet number. The atomized CWS drop mass median diameters resulting from primary atomization follow the wave mechanism-based models. Nevertheless, much smaller drops (mass median diameter of 40 to 60 μm or SMD of 30 to 55 μm) than what these models predict have been obtained for CWS with 0.55 volume fraction of 18 m coal at air-to-slurry mass ratios of 0.175-0.30 and may be attributed to secondary atomization (breakup of primary drops).

6258 (CONF-9106303–, pp. 106-108) **Effects of calcium magnesium acetate on the combustion of coal-water slurries.** Levendis, Y.A. (Northeastern Univ., Boston, MA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89776. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The general objective of the project is to investigate the combustion behavior of single Coal-Water Fuel (CWF) drops burning at high temperature environments. Combustion rates of both uncatalyzed as well as catalyzed CWS drops with Calcium Magnesium Acetate (CMA) catalyst will be obtained. Emphasis will also be given in assessing the effects of CMA on the sulfur capture during combustion. An experimental facility for high temperature combustion studies of liquid drops or solid fuel particles has been constructed and tested. The setup consists of a laminar flow, drop tube furnace capable of achieving maximum wall temperatures of 2,000 K, a three-color, near infrared optical pyrometer with associated calibration devices and a particle sampling probe. Furthermore, various droplet injector configurations were developed, and both a suction thermometer and a hot wire velocimeter were designed and constructed. Numerical techniques have been used to model the furnace environment, and optimize drop injection parameters and gas flow rates. Gas velocity and temperature profiles as well as particle water-evaporation times are also computed. Combustion data on CWF drops, obtained so far, clearly indicates heatup, devolatilization and char combustion periods.

6259 (CONF-9106303–, pp. 121-122) **Scale-up of circulating fluidized bed coal combustors.** Louge, M. (Cornell Univ., Ithaca, NY (United States)); Tanca, M. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88929. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

Circulating fluidization is a promising technology for designing efficient coal combustors with high solid throughputs. Unfortunately, limited understanding of circulating fluidized beds (CFB) renders design extrapolations of pilot reactors to full-scale plants both empirical and expensive. This project is aimed at quantifying the effects of scale-up upon the flow in CFB combustors and elucidating their hydrodynamics through models. For the experiments, the authors have constructed a cold CFB facility (diameter: 20cm; height: 7m) where gases are continuously recycled. In this way, the facility may be fluidized with mixtures of He and CO_2 with adjustable density and viscosity. Hydrodynamic analogy between the cold bed and a coal combustor is achieved by matching all relevant dimensionless parameters. Several choices of gas mixture composition and solid particle properties make the facility analogous to combustors of diameters in the range 30cm to 1m. Thus, direct quantification of scale-up is obtained in an ideal environment for detailed measurements. Principal accomplishments include: the construction of a CFB facility with recycled fluidization gases; the discovery of the importance of Coulomb friction in CFB dynamics; the completion of a series of tests that establish scaling rules for CFB combustors; and the development of models for hydrodynamics and heat transfer in pneumatic transport.

6260 (CONF-9106303–, pp. 132-133) **Predictive models for circulating fluidized bed combustors.** Gidaspow, D. (Illinois Inst. of Tech., Chicago (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89769. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The overall objective of this investigation is to develop experimentally verified hydrodynamic models for circulating fluidized bed (CFB) combustors. Flow regimes of dense phase vertical pneumatic transport of solids, referred to in the literature as circulating fluidized beds, have been computed using a generalization of the Navier-Stokes' equations for two fluids. In the less dense regime corresponding to volume fractions of solids of about one percent, the flow consists of centrally upward moving solids and downward moving clusters. In the dense regime, corresponding to volume fractions of about ten percent, a core-annulus type of regime is obtained with solids descending down at the wall. As an example of the capability of the authors' computer code, flows with and without reaction through a cross-section of a commercial circulating fluidized bed combustor were simulated. The volume fraction of solids in the riser part of the combustor was high near the inlet and then reached a fully-developed flow condition as expected. The system has large asymmetries, downflow of solids near some walls and operates in an oscillatory mode which promotes good heat and mass transfer. Aubrey L. Miller measured particle concentration profiles using an X-ray probe and flux profiles using an extraction probe for three sections of a CFB. Using these data and pressure drop information he computed particulate viscosities as a function of volume fraction of solids. The viscosities measured in the CFB are being compared to kinetic theory predictions which were obtained this year for the reasonbly dilute CFB regime. Preliminary results indicate that in order to obtain a match between the kinetic theory and the measurements, the restitution coefficient of particles must be very close to unity.

6261 (CONF-9106303–, pp. 137-138) **Combustion fume structure and dynamics.** Flagan, R.C. (California Inst. of Tech., Pasadena (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90286. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

This comprehensive study of the dynamics of pyrogenous fumes is designed to develop and validate a model of the formation and evolution of fine particles from minerals volatilized during coal combustion. Of particular interest is the structure that results when particles do not coalesce immediately upon agglomeration, the influence of sintering kinetics on that structure, and the influence of that structure on agglomeration kinetics. Focussing on the fundamental physics that govern the particle structure, size, and composition of fume particles formed in coal combustion, the experimental program is based upon model systems that have been designed to minimize the experimental uncertainties. Results to date of simulations and experimental are described.

6262 (CONF-9106303–, pp. 169-170) **Pyrite thermochemistry, ash agglomeration, and char fragmentation during**

pulverized coal combustion. Niksa, S. (Stanford Univ., CA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-87PC79909. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

During p.f. firing of coal, the evolution of particulate ash from extraneous mineral matter is determined by thermochemistry, agglomeration of molten inclusions as the char is consumed, and fragmentation of the char into finer particulates. The transformation of pyrite inclusions into iron oxide ash is the primary focus of this program, including pyrite thermochemistry, the average number of ash particles per char particle, and the relation between the size distributions and compositions of mineral inclusions and ash particles. The proposed research utilizes synthetic chars with monodisperse pyrite inclusions and a range of controlled pore structures, including the mesosphere structures common to p.f. firing. Studies with the synthetic char establish an essential reference condition for analyzing the behavior of coal char. The size distributions and compositions of ash particulates from both the synthetic chars and coal chars will be monitored during simulated p.f. firing in the new radiant coal flow reactor. Mass concentrations of FeO, Fe_3O_4, $Fe_{1-x}S$, FeS_2, and Fe_2O_3 have been assigned from calibration curves developed with an intrinsic standard, to a relative uncertainty of 5%. Pyrolysis experiments with pyrite particles for furnace temperatures from 1,100K to 1,500K and the transient evolution of the iron ash constituents at 1,560K have been conducted. Experiments of iron ash oxidation have also been demonstrated. The observed compositions have been compared to thermochemical equilibrium compositions assigned in house.

6263 (CONF-9106303–, pp. 171-172) **Thermally induced structural changes in coal combustion.** Gavalas, G.R. (California Inst. of Tech., Pasadena (United States)); Flagan, R.C. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88911. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to measure thermally induced structural changes occurring at temperatures and times typical of pulverized combustion and determine the changes in the intrinsic combustion rate caused by these structural changes. Experimental methods and materials are described. An important trend of declining reactivity with conversion during char combustion was established. It was also found that chars produced by devolatilization at temperatures below 1,400K undergo significant shrinking upon oxidation, even at temperatures at which pore diffusion is not limiting.

6264 (CONF-9106303–, pp. 177-178) **Effects of catalytic mineral matter on CO/CO_2 ratio, temperature and burning time for char combustion.** Longwell, J.P. (Massachusetts Inst. of Tech., Cambridge (United States)); Sarofim, A.F. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89774. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective of this program is to determine the CO/CO_2 ratio generated at or near the surface of burning char as a function of temperature gas composition and char properties with a special emphasis on the effect of catalytic mineral constituents. The electrodynamic balance, developed in the authors' laboratory is being used to study the oxidation of 200μm spherocarb char particles. The weight, oxidation rate, and surface area of individual char particles are measured. CO/CO_2 ratio produced by oxidation was determined by gas chromatography. CO/CO_2 ratio for uncatalyzed spherocarb was measured over a temperature range of 750-1,400 K for steady-state conditions where little oxidation took place in the surrounding cold gas. Above this temperature significant oxidation of CO to CO_2 took place in the gas phase. The CO/CO_2 ratio increases from 0.1 to 700 K to approximately 1.0 at 1,400 K for a 20% oxygen atmosphere. Increasing oxygen decreased the CO/CO_2 ratio. A model of char oxidation has been developed which takes into account the distribution of oxygen chemisorption energies on the char surface and which assumes that CO and CO_2 are formed on different chemisorption sites. Catalysis by calcium was found to increase the number of CO_2 sites with little effect on the CO producing sites. So far, the model results are quite consistent with the measurements.

6265 (CONF-9106303–, pp. 179-180) **Mineral transformations and fragmentation in coal combustion.** Edwards, B.F. (West Virginia Univ., Morgantown (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89791. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The author has studied fragmentation of pure char using a rate equation modeling approach. This fragmentation arises from oxidation in the char macropores leading to widening and fusion of pores, and finally to loss of integrity and to fragmentation as final bridges between different regions of a particle are consumed. The rate equation gives the particle mass distribution n(x,t) (the number of particles of mass x at time t) based on a fragmentation rate a(x), a reaction (mass loss) rate c(x), and a distribution $\bar{b}(x|y)$ of 'daughter' particle masses x produced by fragmentation of a parent particle of mass y. He has obtained analytical and numerical solutions to a rate equation for pure char fragmentation which illuminate various regimes of behavior. He has also calculated the kernels relevant to percolation clusters as a first step toward comparison with experiments. These results deepen the understanding of fragmentation needed to extend the models to include mineral matter.

6266 (CONF-9106303–, pp. 183-184) **Combustion of dense streams of coal particles.** Annamalai, K. (Texas A and M Univ., College Station (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90310. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objectives are to develop a group combustion approach in modeling transient combustion for both the cylindrical and spherical clouds of high volatile coal particles, and to use video-imaging of flame, obtain experimental data on combustion intensity and compare the experimental data with the predictions. The cloud model results have been generalized for planar, cylindrical and spherical clouds since the small scale experiments may involve a batch of particles (approximately spherical), cylindrical stream of particles through a circular slot and planar stream through a rectangular slit. Cylindrical cloud results have already been obtained for ignition time.

6267 (DOE/MC/22012–3003) **Refractory experience in circulating fluidized bed combustors, Task 7: Final report.** Vincent, R.Q. Fluidized-Bed Technologies, Inc., Chattanooga, TN (United States). Nov 1989. 177p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC21-85MC22012. Order Number DE91002083. Source: OSTI; NTIS; GPO Dep.

This report describes the results of an investigation into the status of the design and selection of refractory materials for coal-fueled circulating fluidized-bed combustors. The survey concentrated on operating units in the United States manufactured by six different boiler vendors: Babcock and Wilcox, Combustion Engineering, Foster Wheeler, Keeler Dorr-Oliver, Pyropower, and Riley Stoker. Information was obtained from the boiler vendors, refractory suppliers and installers, and the owners/operators of over forty units. This work is in support of DOE's Clean Coal Technology program, which includes circulating fluidized-bed technology as one of the selected concepts being evaluated.

6268 (DOE/MC/25137–2999) **Nucla CFB Demonstration Project: Detailed public design report.** Colorado-Ute Electric Association, Inc., Montrose, CO (United States). Dec 1990. 253p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC21-89MC25137. Order Number DE91002081. Source: OSTI; NTIS; GPO Dep.

This report documents Colorado-Ute Electric Association's Nucla Circulating Atmospheric Fluidized-Bed Combustion (AFBC) demonstration project. It describes the plant equipment and system design for the first US utility-size circulating AFBC boiler and its support systems. Included are equipment and system descriptions, design/background information and appendices with an equipment list and selected information plus process flow and instrumentation drawings. The purpose of this report is to share the information gathered during the Nucla circulating AFBC demonstration project and present it so that the general public can evaluate the technical feasibility and cost effectiveness of replacing pulverized or stoker-fired boiler units with circulating fluidized-bed boiler units. (VC)

6269 (DOE/PC/79651–T2) **Advanced coal-fired glass melting development program: Phase 2, Final report.** Vortec Corp., Collegeville, PA (United States). May 1991. 136p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79651. Order Number DE92000456. Source: OSTI; NTIS; GPO Dep.

The objective of Phase 1 of the current contract was to verify the technical feasibility and economic benefits of Vortec's advanced combustion/melting technology using coal as the fuel of choice. The objective of the Phase 2 effort was to improve the performance of the primary components and demonstrate the effective operation of a subscale process heater system integrated with a glass separator/reservoir. (VC)

6270 (DOE/PC/79850–6) **Nitrogen oxide abatement by distributed fuel addition: Quarterly report No. 6, November 1, 1988–January 31, 1989.** Wendt, J.O.L.; Mereb, J.B. Arizona Univ., Tucson, AZ (United States). Dept. of Chemical Engineering. 28 Feb 1989. 47p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79850. Order Number DE92005208. Source: OSTI; NTIS; GPO Dep.

A screening study was performed on a laboratory scale down-fired combustor to determine the effect of various variables on the effectiveness of the reburning process as a technique for NO_X abatement. The objective was to define optimum conditions under which reburning can be used and to be able to compare the reburning performance of our combustor to those reported by others. For this purpose, a statistically designed parametric investigation was conducted to determine how a set of controlled variables (primary and secondary stoichiometric ratios, location and length of the reburn zone and primary fuel load) would affect the reduction in NO emissions due to reburning. Also, the effects of other variables (NO in the primary zone, temperatures in the primary, reburn and burnout zones and the residence time in the reburn zone) were also investigated.

6271 (DOE/PC/79850–7) **Nitrogen oxide abatement by distributed fuel addition: Quarterly report No. 7, February 1, 1989–April 30, 1989.** Wendt, J.O.L.; Mereb, J.B. Arizona Univ., Tucson, AZ (United States). Dept. of Chemical Engineering. 20 Jun 1989. 7p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79850. Order Number DE92005209. Source: OSTI; NTIS; GPO Dep.

A combustor has been designed in order to retard the formation of nitrogen oxides by injection of reburning fuel. The design and the rebuilding of the new combustor was completed. Several new features were incorporated in the new design so that it would last longer. The design and construction of the furnace are discussed in this report. (VC)

6272 (DOE/PC/79850–8) **Nitrogen oxide abatement by distributed fuel addition: Quarterly report No. 8, May 1, 1989–July 31, 1989.** Wendt, J.O.L.; Mereb, J.B. Arizona Univ., Tucson, AZ (United States). Dept. of Chemical Engineering. 25 Aug 1989. 19p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79850. Order Number DE92005210. Source: OSTI; NTIS; GPO Dep.

The performance of the new combustor was tested. Experiments showed that this combustor has superior insulating quality than the previous one. Measured radial concentrations indicated uniform distribution of the primary fuel (coal) inside the fire tube resulting in reasonably flat concentration profiles. However, measured radial concentrations after the addition of the reburn fuel showed uneven distribution of the fuel resulting in parabolic concentration profiles, an indication of insufficient mixing in the reburn zone. In order to study mechanisms of nitrogenous species destruction in the reburn zone, it is necessary to achieve adequate mixing if the assumption of one dimensional plug flow behavior is to be valid. Thus, it became necessary to modify the injector design and the injection mode of the reburn fuel to achieve an adequate level of mixing which is the focus of this report. The results show that a minimum reburn fuel jet velocity of 15 m/s (standard conditions) was required which is about 80 times the velocity of the primary effluent. The use of nitrogen gas as a transport medium for the reburn fuel was necessary to achieve the desired jet velocities.

6273 (DOE/PC/79850–9) **Nitrogen oxide abatement by distributed fuel addition: Quarterly report No. 9, August 1, 1989–October 31, 1989.** Wendt, J.O.L.; Mereb, J.B. Arizona Univ., Tucson, AZ (United States). Dept. of Chemical Engineering. 20 Nov 1989. 35p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79850. Order Number DE92005211. Source: OSTI; NTIS; GPO Dep.

Experiments were conducted to investigate the processes that influence the destruction of NO in the fuel rich stage of the reburning process. The objective is to gain a better understanding of the mechanisms that control the fate of coal nitrogen in the fuel rich zone of a combustion process. Time resolved profiles of temperature, major (CO_2, CO, H_2O, O_2, H_2 and N_2), nitrogenous (NO, HCN and NH_3) and hydrocarbon (CH_4 and C_2H_2) species were obtained for various reburning tests. A slow continuous source of HCN was observed in the reburn zone for most tests. HCN formation from NO + CH_i reactions would partially explain this trend. It has been proposed in the past that these reactions would be fast (less than 0.1s) and the produced HCN would be short lived. However, evidence was provided in this study indicating that NO + CH_i reactions might contribute to HCN formation at longer residence times in the reburn zone. Reactions of molecular nitrogen with hydrocarbon radicals were determined to be a significant source of HCN formation, especially as NO levels decreased in the reburn zone. The results of several tests would justify the exclusion of continued coal devolatilization in the reburn zone as a major source of HCN.

6274 (DOE/PC/79850–10) **Nitrogen oxide abatement by distributed fuel addition: Quarterly report No. 10, November 1, 1989–January 31, 1990.** Wendt, J.O.L.; Mereb, J.B. Arizona Univ., Tucson, AZ (United States). Dept. of Chemical Engineering. 1 Feb 1990. 23p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79850. Order Number DE92005212. Source: OSTI; NTIS; GPO Dep.

Mechanisms governing the inter-conversion and destruction of nitrogenous species in the fuel rich reburning zone of a laboratory coal combustor were explored. Emphasis was on a configuration in which the primary flame was of pulverized coal and the reburning fuel was natural gas, although other fuels were also considered. The objective was to extract models to be used in estimating reburning effectiveness in practical combustors. Reburning mechanisms occur in two regimes; one in which fast reactions between NO and hydrocarbons are usually limited by mixing; the other in which reactions have slowed and in which known gas phase chemistry controls. For the latter regime, a simplified model based on detailed gas phase chemical kinetic mechanisms and known rate coefficients was able to predict temporal profiles of NO, NH_3 and HCN. Reactions with hydrocarbons played important roles in both regimes and the Fenimore N_2 fixation reactions limited reburning effectiveness at low primary NO values.

6275 (DOE/PC/88654–T3) **Combustion characterization of beneficiated coal-based fuels: Quarterly report No. 4,**

February–April 1990. Chow, O.K.; Nsakala, N.Y. Combustion Engineering, Inc., Windsor, CT (United States). Jun 1990. 47p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-89PC88654. Order Number DE92004870. Source: OSTI; NTIS; GPO Dep.

The objectives of this project include: (1) the development of an engineering data base which will provide detailed information on the properties of BCFs influencing combustion, ash deposition, ash erosion, particulate collection, and missions; and (2) the application of this technical data base to predict the performance and economic impacts of firing the BCFs in various commercial boiler designs. The technical approach used to develop the technical data includes: bench-scale fuel property, combustion, and ash deposition tests; pilot-scale combustion and ash effects test; and full-scale combustion tests.

6276 (DOE/PC/88697–T4) **Superclean coal-water slurry combustion testing in an oil-fired boiler: Semiannual technical progress report, February 15, 1991–August 15, 1991.** Miller, B.G.; Morrison, J.L.; Xie, Jiangyang; Walsh, P.M.; Schobert, H.H.; Scaroni, A.W. Pennsylvania State Univ., University Park, PA (United States). Combustion Lab. 1 Oct 1991. 48p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC22-89PC88697. Order Number DE92004583. Source: OSTI; NTIS; GPO Dep.

Pennsylvania State University is conducting a superclean coal-water slurry (SCCWS) program with the objective of determining the capability of effectively firing SCCWS in an industrial boiler designed for oil. Penn State has entered into a cooperative agreement with DOE to determine if SCCWS (a fuel containing coal with less that 3.0% ash and 0.9% sulfur) can effectively be burned in an oil-designed industrial boiler without adverse impact on boiler rating maintainability, reliability, and availability. The project will provide information on the design of new systems specifically configured to fire these clean coal-based fuels.

6277 (DOE/PC/89651–T2) **Innovative clean coal technology (ICCT): 500 MW demonstration of advanced wall-fired combustion techniques for the reduction of nitrogen oxide (NO_x) emissions from coal-fired boilers: Phase 1, Baseline tests report.** Southern Co. Services, Inc., Birmingham, AL (United States); Energy Technology Consultants, Irvine, CA (United States). 13 Sep 1991. 193p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC22-90PC89651. Order Number DE92002133. Source: OSTI; NTIS; GPO Dep.

The major objectives of the project are to: (1) demonstrate the performance of three combustion NO_x control technologies; (2) determine the short-term NO_x emission trends for each of the operating configurations; (3) determine the dynamic long-term NO_x emission characteristics for each of the operating configurations using sophisticated statistical techniques; (4) evaluate progressive cost-effectiveness (i.e., dollars per ton of NO_x removed) of the low NO_x combustion technologies tested; and (5) determine the effects on other combustion parameters (e.g., CO production, carbon carry-over, particulate characteristics) of applying the low NO_x combustion technologies. (VC)

6278 (DOE/PC/89659–2) **Mathematical and experimental pilot-scale study of coal reburning for NO_x control in cyclone boilers.** Farzan, H.; Wessel, R.A. Babcock and Wilcox Co., Alliance, OH (United States). Research and Development Div. Jun 1991. 123p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FC22-90PC89659. Order Number DE92000029. Source: OSTI; NTIS; GPO Dep.

The purpose of this pilot-scale study was to examine the effectiveness of reburning for NO_x reduction and to assess the potential side effects. In addition, the potential of a high-sulfur Illinois coal for cyclone reburning application was evaluated. (VC)

6279 (DOE/PC/89776–T5) **Effects of calcium magnesium acetate on the combustion of coal-water slurries: Project status report, 1 September 1989–30 November 1989.** Northeastern Univ., Boston, MA (United States). Dept. of Chemical Engineering. [1989]. 16p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-89PC89776. Order Number DE92004499. Source: OSTI; NTIS; GPO Dep.

The general objectives of the project is to investigate the combustion behavior of single Coal-Winter Slurry particles burning at high temperature environments. Both uncatalyzed as well as catalyzed CWS drops with Calcium Magnesium Acetate (CMA) catalyst will be investigated. Emphasis will also be given in the effects of CMA on the sulfur capture during combustion.

6280 (DOE/PC/90176–T54) **Cyclone reburning retrofit-corrosion evaluation: Final technical report, September 1, 1990–August 31, 1991.** Sarv, H. Babcock and Wilcox Co., Alliance, OH (United States). [1991]. 25p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-90PC90176. Order Number DE92004190. Source: OSTI; NTIS; GPO Dep.

Reduction of oxides of nitrogen (NO_x) from cyclone-equipped boilers is best accomplished by the application of reburning technology. Reburning process involves injection of a supplementary fuel above the cyclone to create a reducing zone for NO_x removal. Overfire air is introduced above this zone to achieve complete combustion. Since the reburning zone must operate substoichiometrically, tube corrosion due to H_2S formation within the modified combustion zones can be a potential concern when the reburning fuel is a high-sulfur coal. H_2S is a corrosive gas and its concentration is an indicator of the tendency for fireside corrosion in fuel-rich combustion systems. This research program was undertaken to assess corrosion resistance of three commercially available alloys (carbon steel, SA210-A1; low-alloy steel, SA213-T22; and stainless steel, SA213-TP304) as well as coated steel alloy (SA213-T2). The surface chromium contents of the alloys ranged from 0 to 30%. Four air-cooled corrosion probes, each containing segments of the selected alloys were constructed. The probes were exposed for up to 1200 hours and at a metal temperature of 850°F to combustion gases generated by firing a high-sulfur Illinois #6 coal at conditions simulating coal reburning.

6281 (DOE/PC/90275–T18) **Development of an advanced high efficiency coal combustor for boiler retrofit: Task 3, Demonstration scale testing at 50×10^6 BTU/HR: Final report.** LaFlesh, R.C.; Rini, M.J.; McGowan, J.G. Combustion Engineering, Inc., Windsor, CT (United States). Apr 1989. 86p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-86PC90275. Order Number DE92004972. Source: OSTI; NTIS; GPO Dep.

The objective of this program is to develop an advanced coal-combustion system capable of being retrofitted to industrial boilers originally designed for firing natural gas, distillate, and/or residual oil. Through the use of beneficiated coal fuel and advanced combustion technology, the program was to produce a combustion system which is reliable, simple to operate, and incorporates significant reductions in NO_x, SO_x, and particulate emissions over a base coal case. Contract W-31109-ENG-38. (CONF-911184-6: 13. annual North American conference of the International Association for Energy Economics, Chicago, IL (United States), 18-20 Nov 1991). Order Number DE92003519. Source: OSTI; NTIS; INIS; GPO Dep.

Many current global warming mitigation policy proposals call for large, near-term reductions in CO_2 emissions, thereby entailing high initial carbon emission tax rates or permit prices. This paper claims that these high initial tax rates or permit prices are not cost-effective in achieving the desired degree of climate change control. A cost-effective permit system is proposed and described that, under certain assumptions, would allow markets to optimally lead permit prices along a gradually increasing trajectory over tie. This price path presents the Hotelling result and would ease the abrupt, inefficient, and costly adjustments imposed on the fossil fuel and other industries in current proposals. This finding is demonstrated using the Argonne Model, a linear programming energy-environmental-economic model that allows for intertemporal optimization of consumer energy well-being. 12 refs., 3 figs., 1 tab.

6284 (ANL/EAIS/TM-62) **Clean coal technologies—An International seminar: Seminar evaluation and identification of potential CCT markets.** Guziel, K.A.; Poch, L.A.; Gillette, J.L.; Buehring, W.A. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. Jul 1991. 37p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. Order Number DE92004778. Source: OSTI; NTIS; INIS; GPO Dep.

The need for environmentally responsible electricity generation is a worldwide concern. Because coal is available throughout the world at a reasonable cost, current research is focusing on technologies that use coal with minimal environmental effects. The United States government is supporting research on clean coal technologies (CCTs) to be used for new capacity additions and for retrofits to existing capacity. To promote the worldwide adoption of US CCTs, the US Department of Energy, the US Agency for International Development, and the US Trade and Development Program sponsored a two-week seminar titled Clean Coal Technologies – An International Seminar. Nineteen participants from seven countries were invited to this seminar, which was held at Argonne National Laboratory in June 1991. During the seminar, 11 US CCT vendors made presentations on their state-of-the-art and commercially available technologies. The presentations included technical, environmental, operational, and economic characteristics of CCTs. Information on financing and evaluating CCTs also was presented, and participants visited two CCT operating sites. The closing evaluation indicated that the seminar was a worthwhile experience for all participants and that it should be repeated. The participants said CCT could play a role in their existing and future electric capacity, but they agreed that more CCT demonstration projects were needed to confirm the reliability and performance of the technologies.

The World Coal Institute estimates coal should overtake oil as the world's largest source of primary energy by the turn of the century. Current world coal production of 3.6 billion tons in 1990 is predicted to rise to 4 billion tons by the year 2000. It is conceded that a major environmental problem with burning coal is the so-called greenhouse effect. The question is how do you use the new technologies that have been developed which now allow coal to be burned with minimum damage to the environment. Despite their technical merits, acceptance of these new technologies is slow because they appear uncompetitive when compared with historic energy costs. Unless economic comparisons include some form of environmental evaluation, this issue will continue to be a barrier to progress. To avoid stagnation and provide the necessary incentive for implementing badly needed change, structural changes in energy economics need to be made which take into account the environmental cost element of these emerging new technologies. The paper discusses coal trade and quality and then describes the three main areas of development of clean coal technologies: coal preparation, combustion, and flue gas treatment.

6286 (DOE/EIA-0121(91/2Q)) **Quarterly coal report, April–June 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. 19 Nov 1991. 148p. Sponsored by U.S. DOE Energy Information Administration. Order Number DE92003716. Source: OSTI; NTIS; GPO; GPO Dep.

The Quarterly Coal Report provides comprehensive information about US coal production, exports, imports, receipts, consumption, and stocks to a wide audience, including Congress, Federal and State agencies, the coal industry, and the general public. The data represented in this report are collected and published by the Energy Information Administration (EIA) to fulfill data collection and dissemination responsibilities as specified in the Federal Energy Administration Act of 1974 (Public Law 93-275) as amended. This issue presents detailed quarterly data for April 1991 through June 1991, aggregated quarterly historical data for 1983 through the fourth quarter of 1990, and aggregated annual historical data for 1960 through 1990 and projected data for selected years from 1991 through 2010. Appendix C displays, from 1980 on, detailed quarterly historical coal imports data, as specified in Section 202 of the Energy Policy and Conservation Amendments Act of 1985 (Public Law 99-58). Appendix D gives selected quarterly tables converted to metric tons. To provide a complete picture of coal supply and demand in the United States, historical information and forecasts have been integrated in this report. Additional historical data can also be found in the following EIA publications: Annual Energy Review 1990 (DOE/EIA-0384(90)), Monthly Energy Review (DOE/EIA-0035), and Coal Data: A Reference (DOE/EIA-0064(90)). Other projections can be found in the Short-Term Energy Outlook (DOE/EIA-0202), a quarterly report, and in the Annual Energy Outlook 1991 (DOE/EIA-0383(91)). 7 figs., 37 tabs.

6287 (DOE/EIA-M-048) **Coal supply and transportation model (CSTM): Model documentation.** USDOE Energy Information Administration, Washington, DC (United States). Office of Integrated Analysis and Forecasting. Nov 1991. 160p. Sponsored by U.S. DOE Energy Information Administration. Order Number DE92003555. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

The Coal Supply and Transportation Model (CSTM) forecasts annual coal supply and distribution to domestic and foreign markets. The model describes US coal production, national and international coal transportation industries. The objective of this work is to provide a technical description of the current version of the model.

6288 (ETDE-mf-2750311) **Black coal. Facts and trends 1991.** Gesamtverband des Deutschen Steinkohlenbergbaus, Essen (Germany). 1991 84p. (In German). Order Number DE92750311. Source: OSTI; NTIS (US Sales Only).

Pictures illustrate the major development on the energy sector, especially in coal mining, and the characteristic figures and data. (HS).

6289 (ORNL/TM-11787) **Marketable permits for controlling sulphur dioxide emissions.** Hale, D.R. (USDOE Energy Information Administration, Washington, DC (United States)); Bjornstad, D.J. Oak Ridge National Lab., TN (United States). Dec 1991. 16p. Sponsored by U.S. DOE Energy Information Administration. DOE Contract AC05-84OR21400. Order Number DE92003947. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to describe research sponsored by the Energy Information Administration (EIA) at the Oak Ridge National Laboratory (ORNL) into the nature of the auctions described in the bills. The research was undertaken at the request of the House Committee on Energy and Commerce to assess how various provisions in the bills might affect the workings of the market. Because the project called for the analysis of market mechanisms that do not now exist, a "laboratory" approach was applied in which artificial markets are created using computerized trading, volunteer subjects, and cash incentives to mimic the markets being studied.

Dr. Mark Isaac, at the University of Arizona, and Dr. Jamie Kruse, at the University of Colorado, led teams that designed and conducted the laboratory experiments. 4 figs., 5 tabs.

6290 (ETDE/JP-mf–2749181) **Handbook of safety technology of coal mines. 3.: Spontaneous combustion.** Mining and Material Processing Inst. of Japan, Tokyo (Japan). Mar 1991 80p. (In Japanese). Order Number DE92749181. Source: OSTI; NTIS (US Sales Only).

Of safety technologies of coal mines summarized as a handbook, described is the safety technology on spontaneous combustion. The spontaneous combustion of coal is caused by storage of oxidation heat, but real factors causing the combustion are complicated. Immediate detection by a centralized monitoring sensor of generated gases (CO, CH_4, air leakage), temperatures and odors are contributed to reduction of accidents. The spontaneous combustion is apt to occur in mine roadway and abandoned shafts and by disturbance and degradation of the remaining coal left alone and by air leakage. It is important to shield a ventilation current and secure sealing after mining. The fly ash (FA) method in which FA slurry is streamed and transported for filling-up brought an ennovation to measures against spontaneous combustion. As a direct fire-fighting method, the following interception of fire source is cited: watering pipes, boring water-pouring, milk state liquid injection, foam-plug, FA-plug. As an indirect fire-fighting method, the following are cited: a method in which the mine roadway is lined and the inside of the lining is filled with FA, etc. for sealing, a sealing dam construction method. Some accidents at coal mines and prevention measures are also explained. 49 refs., 45 figs., 23 tabs.

6291 (ETDE/JP-mf–2749182) **Handbook of safety technology of coal mimes. 4.: Mine fires.** Mining and Material Processing Inst. of Japan, Tokyo (Japan). Mar 1991 67p. (In Japanese). Order Number DE92749182. Source: OSTI; NTIS (US Sales Only).

Of safety technologies of coal mines summarized as a handbook, described is the safety technology on mine fires. The mine fire is a phenomenon that combustible materials burn and the fire spreads along the mine roadway or the working face. Heat, smoke and gas affect each other and their interaction is complicated. Danger of fire spread in a large range is predicted because in the mine there are combustible materials which are installed in sequence as timbers, conveyor belts, cables and a large amount of ventilation is conducted. Also, there are hot air flow and gas including a lot of harmful ingradients on the leeward of the mine, and the high possibility of a serious accident is predicted. The colsed space which stores heat and is filled with gas makes escape and fire-fighting difficult. Advanced auto fire detecting systems have recently appeared. As well as prevention of the fire, prevention of the fire spread is important, and therefore measures against the fire spread are taken such as making the inside of mine roads non-combustible and fire-retardant, making fire-resistant and fire-preventable mine roadways, making water spray zones. In addition to chemicals, sand, rock dust and water for extinguishing fires, foam is introduced to the fire-fighting technology. Use of liquid nitrogen and inert gas is also under study. Some accidents and analysis of the causes are described. 109 refs., 52 figs., 15 tabs.

The Oil and Gas Field Code Master List 1991 is the tenth annual listing of all identified oil and gas fields in the United Sates. It is updated with field information collected through October 1991. The purpose of this publication is to provide codes for easy identification of domestic fields. Standardization on these field codes will foster consistency of field identification by government and industry.

6293 (IFP–37-606) **Two-dimensional model of transport phenomena in sedimentary basins by finite element method.** Bouvier, V. Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France); Ecole Nationale Superieure des Mines, 75 - Paris (France). 1989. 329p. (In French). Order Number DE92733713. Source: OSTI; NTIS (US Sales Only).

A finite element method is applied to a two-dimensional numerical model of transport phenomena occurring in the sedimentary basins during their formation. The physics used -conservation laws, Darcy's law, compaction laws for porous media, evolution laws for thermal and hydrodynamical coefficients- is that which is used in the THEMIS model, already developed at the French Petroleum Institute. The flow problem is written in variational form, whose main unknown is the fluid pressure. The most important difficulties encountered are relative to the domain evolution (compaction, sedimentation, erosion) and highly permeable sediments such as sands. The complexity of the medium deformation is numerically described by a moving mesh whose movement is linked to that of the solid material and which is composed of quadrangles and triangles. Thermal phenomena are also modeled. The same approach as that used for the resolution of the fluid problem is applied to solve the heat equation. Many tests and comparisons with finite volume method were performed. They showed a good numerical and physical behaviour of the finite element method. This method is better adapted than the other one for modeling heterogeneous and geometrically complicated geological media. The study of a North Sea geological cross-section showed the model's capability in simulating the physical phenomena of flow in a complex environment.

Source: OSTI; NTIS (US Sales Only).

Samples of unaltered Posidenra skale out of shallow wells were compared with samples of weathered persidonia stale from soils in order to investigate the conversion of the organic material by weathering and the soil burden of geogenic hydrocarbons from carbonaceons rocks. (orig./EF).

6295 **Multifold vertical seismic profile acquisition method and technique for imaging the flank of a salt dome.** McClellan, B.D.; Adams, O.T.; Cox, V.D. To Conoco Inc. (USA). 23 Aug 1991. Filed date 23 Feb 1990. Canada Patent patent application 2010842. 22p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

A seismic layout and processing technique is disclosed for providing better data acquisition relative to salt domes. The technique utilizes a line of acoustic pulse sources in a selected pattern opposite a salt flank from a wellbore, and a plurality of spaced acoustic receivers are disposed along the wellbore. Normally, a near offset is used when the salt dome interface is shallow and a far offset when the interface is deep. Acoustic pulses are generated and a first break time is determined when the pulses first pass the receivers on their way to the interface. A total travel time is obtained when the pulses are reflected by the vertical interface and travel back to the receivers. A 2-way travel time is calculated from a pseudo seismic source location to the receivers by subtracting the first break time from the total travel time. The data are processed to establish a pseudo-source point along the wellbore in relation to each of the receiver points to enable subsequent common depth point processing of the data. In this manner, a vertical common reflection point outline of the vertical flank of the salt dome is established. The technique of the invention requires no initial geologic model for processing and, in fact, gives a first estimate of the geologic model required for the usual processing. The unique orientation of the resulting common midpoint gather, along with the high source/receiver multiplicity, results in a seismic image of the salt face that is superior to that obtainable from currently available vertical seismic profile technology. The technique is illustrated for the case of a marine exploration effort in order to emphasize its effectiveness. 4 figs.

6296 (DOE/BC/14202–6) **Microbial enhancement of oil production from carbonate reservoirs: Final report, January 1990–May 1991.** Tanner, R.S.; Udegbunam, E.O.; McInerney, M.J.; Knapp, R.M.; Adkins, J.P. Oklahoma Univ., Norman, OK (United States). Nov 1991. 225p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-90BC14202. Order Number DE92001007. Source: OSTI; NTIS; GPO Dep.

The objective of this research contract was to examine MEOR in carbonate reservoirs by reviewing the literature pertinent to MEOR in carbonate systems, determining the microbial ecology of carbonate reservoirs, examining the effect of microorganisms on carbonate matrices, documenting MEOR in model carbonate core systems, and constructing a mathematical model for MEOR in carbonates. 11 refs., 19 figs., 38 tabs. (VC)

6297 (DOE/BC/14246–T10) **Microbial field pilot study: [Quarterly report], July 1, 1992–September 30, 1992.** Knapp, R.M.; McInerney, M.J.; Menzie, D.E. Oklahoma Univ., Norman, OK (United States). 6 Dec 1991. 8p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-89BC14246. Order Number DE92004433. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to perform a microbial enhanced oil recovery field pilot test in the Southeast Vassar Vertz Sand Unit (SEVVSU) in Payne County, Oklahoma. Indigenous, anaerobic, nitrate-reducing bacteria will be stimulated to selectively plug flow paths which have been preferentially swept by a prior waterflood. This will force future flood water to invade bypassed regions of the reservoir and increase sweep efficiency. During this quarter an additional tracer study was performed in the field to determine pretreatment flow paths and the first nutrients were injected. 2 figs.

Aug 1991. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-87ER13673. Order Number DE92005268. Source: OSTI; NTIS; GPO Dep.

This report summarizes accomplished and proposed work for the fundamental studies of fluid mechanics and stability in porous media. Topics discussed include: viscous fingering in miscible displacements; polymer flow interactions in free shear layers of viscoelastic fluids; effect of nonmonotonic viscosity profiles on the stability of miscible displacements in porous media; and references. (JL)

6299 (IFP–37891) **Hydrocarbons production with horizontal and vertical wells: Analytic study of the steady state monophasic flows in presence or absence of a second phase.** Giger, F.M. Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France); Ecole Nationale Superieure des Mines, 75 - Paris (France). Jul 1989. 160p. (In French). Order Number DE92733710. Source: OSTI; NTIS (US Sales Only).

The analytic study of the monophasic steady state flow towards a horizontal well gives the expression of its productivity and a description of the pressure field. A local criterion is derived out of it for the comparison of drainage efficiency between horizontal and vertical wells as well as a global criterion usable at the whole reservoir scale. The water cresting effect, induced by the hydrocarbons production with a horizontal well in presence of a second liquid phase is exactly described in two dimensions with an analytic solution. Permeability anisotropy and several feed mechanisms are coped with. In order to allow comparisons, a water coning model below a vertical well taking permeability anisotropy into account is established.

6300 (UCRL-JC–106751) **Redirection of dynamic compressive waves in materials with nearly orthogonal and random joint sets.** Walton, O.R.; Maddix, D.M.; Butkovich, T.R.; Heuze, F.E. Lawrence Livermore National Lab., CA (United States). Mar 1991. 11p. Sponsored by U.S. DOE Fossil Energy; U.S. Department of Defense. DOE Contract W-7405-ENG-48. (CONF-9106120–2: Recent advances on mechanics of structure continua American Society of Mechanical Engineers (ASME) applied mechanics conference, Columbus, OH (United States), 16-19 Jun 1991). Order Number DE92003700. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Two-dimensional discrete-particle (i.e., distinct-element) calculations demonstrate the redirection of particle velocity vectors emanating from a rapidly loaded region such as an explosively loaded borehole or tunnel. Previous simulations have demonstrated redirection of particle motions in randomly fractured media when significant shearing displacements result in dilatancy. This work shows redirection in media with nearly regular and nearly orthogonal joint sets, resulting in asymmetric radiation patterns, even for situations with quite small displacements. Random joint sets (simulated with Voronoi polygons) on the other hand, do not exhibit significant redirection of emanating signals unless significant shear displacements occur. Such redirection could account for anisotropic seismic radiation patterns observed around deeply buried explosions in hard rock. Variation of contact parameters and joint models in these simulations serves to demonstrate that the joint pattern and block kinematics are the dominant mechanisms contributing to this redirection of the compressive waves. 24 refs., 8 figs.

6301 **In-situ tuned microwave oil extraction process.** Kiamanesh, A.I. 12 Aug 1991. Filed date 12 Feb 1990. Canada Patent patent application 2009782. 26p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

A method is provided for extracting oil or enhancing oil extraction from underground reservoirs. The method devises and customizes an electromagnetic irradiation protocol to individual reservoirs. Reservoir samples are tested to determine their oil content, molecular resonance frequencies and the effects of the electromagnetic field on their compounds. Electromagnetic field frequency, intensity, and duration necessary to heat and/or crack individual molecules is determined. Equipment is selected and installed in underground excavations according to the results of the laboratory tests and the geophysics of the deposit. The dielectric constant of the formation is reduced by draining water and drying the formation with electromagnetic energy. A combination of the effects of microwave flooding, plasma torch activation, molecular cracking, and selective heating is used to heat the oil within the reservoir by controlling frequency, duration, intensity, direction, and waveform of the electromagnetic field. The reservoir conditions are continuously monitored during production to act as feedback for modification of the irradiation protocol. The invention is applicable to petroleum, oil sand, and oil shale deposits. 11 figs.

Massachusetts Executive Office of Consumer Affairs and Business Regulation, Boston, MA (United States). Div. of Energy Resources. Jun 1991. 24p. Sponsored by U.S. DOE Energy Information Administration. DOE Contract FC01-91EI22627. Order Number DE92005261. Source: OSTI; NTIS; INIS; GPO Dep.

During the 1990/91 heating season, the Massachusetts Division of Energy Resources (DOER) participated in a joint data collection program between several state energy offices and the federal Department of Energy's (DOE) Energy Information Administration (EIA). The purpose of the program was to collect and monitor retail and wholesale heating oil and propane prices and inventories from October 1990 through March 1991. This final report begins with an overview of the unique events which had an impact on the reporting period. Next, the report summarizes the results from the residential heating oil and propane price surveys conducted by DOER over the 1990/91 heating season. The report also incorporates the wholesale heating oil and propane prices and inventories collected by the EIA and distributed to the states.

6303 (DOE/EIA–0538(91/92-7)) **Winter Fuels Report week ending: November 8, 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 14 Nov 1991. 70p. 6306 (OCS/EIS/EA/MMS–91-0054-Vol.1) **Gulf of Mexico Sales 139 and 141: Central and western planning areas: Final environmental impact statement: Volume 1, Sections 1 through 4.C.** Minerals Management Service, New Orleans, LA (United States). Gulf of Mexico OCS Regional Office. Nov 1991. 329p. Sponsored by U.S. Department of the Interior. Source: OSTI; Minerals Management Service, Gulf of Mexico OCS Region, 1201 Elmwood Park Blvd., New Orleans, LA 70123-2394.

This environmental impact statement (EIS) addresses two proposed Federal actions, lease Sales 139 and 141, that will offer for lease Gulf of Mexico Outer Continental Shelf (OCS) areas that may contain economically recoverable oil and gas resources. The lease sales are proposed for 1992 and include lease blocks in the Central Gulf of Mexico Planning Area (CPA) and Western Gulf of Mexico Planning Area (WPA). Approximately 9700 blocks will be available for lease under the two proposed actions; only a small percentage is expected to be actually leased. On average, 432 blocks in the Central Gulf and 279 blocks in the Western Gulf have been leased in individual Gulf of Mexico OCS lease sales since 1984. Of the blocks that will be leased as a result of the two proposed actions, only a portion will be drilled and will likely result in subsequent production. The analytical methods used in this EIS have been formulated over a period of years and are based on the methodology outlined within the National Environmental Policy Act (NEPA). The first step of the analysis is the identification of significant environmental and socioeconomic resources through the scoping process. A range of impact levels is then defined for each of the significant resources to be analyzed. A range of energy resource estimates is derived from geologic and economic assumptions and a range of alternatives to the proposed action is established.

6307 (OCS/EIS/EA/MMS–91-0054-Vol.2) **Gulf of Mexico Sales 139 and 141: Central and western planning areas: Final Environmental Impact Statement: Volume 2, Sections 4.D through 9.** Minerals Management Service, New Orleans, LA (United States). Gulf of Mexico OCS Regional Office. Nov 1991. 564p. Sponsored by U.S. Department of the Interior. Source: OSTI; Minerals Management Service, Gulf of Mexico OCS Region, 1201 Elmwood Park Blvd., New Orleans, LA 70123-2394.

A range of impact levels is then defined for each of the significant resources to be analyzed. A range of energy resource estimates is derived from geologic and economic assumptions and a range of alternatives to the proposed action is established. Estimated levels of exploration and development actively are assumed for the purposes of the analysis. A scoping process was used to obtain information and comments on the proposed actions and the potential environmental effects from diverse interests, including the affected States, Federal agencies, the petroleum industry, environmental and public interest groups, and concerned individuals.

6308 **Apparatus for recuperating oil spills from water.** Slezak, M.L. 12 Aug 1991. Filed date 12 Feb 1990. Canada Patent patent application 2009785. 7p. (In French). Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

An apparatus for collecting spilled oil from a water surface is fitted with wheels and floats which allow it to operate on a beach as well as in deep water. Aspiration devices floating on the water, which are fixed in front of the apparatus, suck up the water mixed with a certain portion of oil. The inlets to the aspiration devices have variable openings which automatically adjust to the thickness of the oil layer, thus minimizing the quantity of water taken in. The aspirated liquid is fed to a bottomless reservoir formed from a retractable skirt where the oil/water mixture is separated. The oil, rising to the surface, is then recovered in a second reservoir placed at the center of the first reservoir, whose upper rim is automatically maintained just under the upper level of the oil, permitting the oil to flow into the second reservoir from which it can be pumped to a floating reservoir or any other container. 3 figs.

6309 (DOE/EIA–0550) **Average effective corporate income tax rates for petroleum operations, 1977–1989.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 18 Nov 1991. 40p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. Order Number DE92003942. Source: OSTI; NTIS; GPO; GPO Dep.

This study analyzes changes in average effective corporate income tax rates for the petroleum and aggregate operations of a major group of energy companies from 1977 to 1989. Effective rates are presented on a worldwide basis, as well as for domestic versus foreign operations. The analysis focuses on effective rates for the petroleum line of business (including both oil and gas) and for segments within that line. The study is based on data reported by major energy companies to the Energy Information Administration, using its Financial Reporting System. 5 figs., 10 tabs.

6310 **Apparatus for hydrocleaning the exterior surfaces of pipelines and the like.** Chapman, G.R.; Reid, C.M.; Seale, J.B.; Andruik, D.R. To Cups, Inc. (USA). 31 Aug 1991. Filed date 28 Feb 1990. Canada Patent patent application 2011196. 54p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

Oil and gas transmission pipelines of large diameter are usually coated and then buried before being used for transport of fluid. As a result of coating failures over the years, many pipeline operators have initiated coating rehabilitation projects. Improvements are disclosed which relate to apparatus utilized for removing old coatings and miscellaneous contaminants from the pipeline exterior surface. According to the invention, a hydrocleaning apparatus for pipelines includes a frame capable of advancing lengthwise of the pipeline. Such a frame carries a plurality of liquid jetting modules which, in use, are disposed in an array around the pipeline surface to enable cleaning of the entire surface. The frame can be opened up to allow the apparatus to be fitted to or removed from a continuous pipeline. The frame arrangement and module mounting system are designed to provide good cleaning efficiency and proper orientation of the various modules in spite of pipeline irregularities including out-of-round conditions, uneven coating thicknesses, and wrinkles. A pivoting module mount helps to maintain cleaning efficiency in the case where thick coatings are being removed. The frame drive wheels are disposed forwardly of the modules to avoid contamination of the cleaned surfaces by deposits that may build up on the wheels. A shroud system connected to the modules prevents substantial escape of contaminating liquids and debris into the environment. 14 figs.

6311 (DOE/CE/40938–1) **Collection of VLE data for acid gas-alkanolamine systems using Fourier transform infrared spectroscopy: Phase 1, September 29, 1990–September 30, 1991.** Bullin, J.A.; Frazier, R.E. Texas A and M Univ., College Station, TX (United States). Texas Engineering Experiment Station. Sep 1991. 15p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FC02-90CE40938. Order Number DE92004027. Source: OSTI; NTIS; GPO Dep.

The industrial standard process for the purification of natural gas is to remove acid gases, mainly hydrogen sulfide and carbon dioxide, by the absorption and reaction of these gases with alkanolamines. Inadequate data for vapor – liquid equilibrium (VLE) hinder the industry from converting operations to more energy efficient amine mixtures and conserving energy. Some energy reductions have been realized in the past decade by applying such amine systems as "hindered" amines, methyldiethanolamine (MDEA), and MDEA based amine mixtures. However, the lack of reliable and accurate fundamental VLE data impedes the commercial application of these more efficient alkanolamine systems. The first project objective is to improve the accuracy of vapor – liquid equilibrium measurements at low hydrogen sulfide concentrations. The second project objective is to measure the VLE for amine mixtures. By improving the accuracy of the VLE measurements on MDEA and mixtures with other amines, energy saving can be quickly and confidently implemented in the many existing absorption units already in use. If about 25% of the existing 95.3 billion SCFD gas purification capacity is converted to these new amine systems, the energy savings are estimated to be about 3×10^{14} BTU/yr.

6312 **Sweetening of sulfur-containing gases using ozone.** Ortega, P.C.; Verona, D.; Cabrera, L.M. To Intevep, SA (Venezuela). 9 Aug 1991. Filed date 9 Feb 1990. Canada Patent patent application 2009754. 30p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

A process is provided for removing significant amounts of oxidizable sulfur-containing compounds from a feed gas using ozone and a liquid scrubbing composition to obtain a gas having a reduced sulfur content. Suitable scrubbing compositions include aqueous solutions such as ammonia solutions, and aqueous alkali or alkaline earth metal carbonate suspensions. The process also yields a sulfate-containing compound suitable for use as an agricultural fertilizer such as ammonium sulfate, or as a building material such as gypsum. The process can be operated at approximately ambient temperature and at a relatively low pressure, although elevated temperatures and pressures can also be utilized. A catalyst is not required. The feed gas can be sour natural gas, flue gas from the combustion of organic material, gases produced as byproducts of petroleum processes, and the like. As this feed gas is conmingled with ozone or an ozone-containing gas, sulfur oxides are produced which are converted to the corresponding sulfates in the scrubbing composition to obtain a product solution. Optionally, an oxygen-containing gas can be subsequently passed through the product solution to oxidize any bisulfate ions present to sulfate ions. Experiments are described to illustrate the process of the invention. 3 figs., 3 tabs.

6313 (DOE/CE/15459–T4) **Natural gas conversion process: Fourth quarterly report.** Gondouin, M. S-Cal Research Corp., San Rafael, CA (United States). [1991]. 6p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract

FG01-90CE15459. Order Number DE92000397. Source: OSTI; NTIS; GPO Dep.

Work continued on Task No. 3. Particular attention was given to the back pressure control at the two gaseous effluent outlets and to the incineration of these effluents prior to their disposal. Temperature of the riser/regenerator and steam requirements were predicted from the gasification kinetics of coke and of coal char experimentally determined at atmospheric pressure, but at somewhat lower temperatures by H. Heinemann. The results of interactions of CH4 molecules with a Hydrogen Plasma in the adsorbed layer at the surface of refractory oxides were compared with those in the gas phase in order to select the optimum temperature range in the Cyclone reactor.

6314 **LPG [liquefied petroleum gas] tank control valve system.** Guenther, M.J.J. 23 Aug 1991. Filed date 23 Feb 1990. Canada Patent patent application 2010880. 31p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

A multi-functional control valve system for a liquefied petroleum gas (LPG) tank comprises, on a single frame, the following components. A fill port is used to deliver LPG from a supply source to the tank, and has a manual shutoff valve. A delivery port, independent of the fill port, is provided for passing LPG from the tank to a delivery line for utilization at a location remote from the tank. This port also has a manual shutoff valve. A fuel level monitor is associated with a frame responsive to the level of LPG in the tank. An automatic shutoff associated with the fuel level monitor is positioned in the fill port automatically to move to close the fill port and stop delivery of LPG to the tank when the fuel in the tank reaches a predetermined level. The shutoff is automatically releaseable from that closed position when LPG in the tank falls below that level, as indicated by the monitor. This valve system provides in one compact frame, which may be readily fitted or retrofitted to a tank, many desirable features for safe and convenient LPG tank operation. 10 figs.

6315 **Tower supported gas transmission line.** Williamson, V.A. 19 Aug 1991. Filed date 19 Feb 1990. Canada Patent patent application 2010300. 7p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

In a system for the overland transmission of natural gas or other gas, a gas-inflated polymer film tube is used with or without parallel support in a suspension bridge interlinked series between metal transmission towers, with gas transmission velocity maintained by gas compressor stations up to 100 miles apart. Two such systems are disclosed: a non-rope-supported system in which the tensile strength of the tube itself is sufficient for it to be self-supportive as a bridge while also functioning as a full lengthwise tower guyline support; and a parallel rope-supported system with guy wires holding crossline strains from drilled or buried anchorages. The tubes are made of fluoropolymer films and are made up by traditional methods of gluing together flexible polymer film in continuous panels to produce a tube form. If 12-mil polyvinyl fluoride film is used at a gas pressure of 3.6 lb/in^2, a 10-ft diameter tube between compression stations will produce a gas velocity of 339 ft/s, will transmit 3.4 billion ft^3/d of gas, and can withstand wind pressures produced at wind velocities up to 136 mph. The polyvinyl fluoride material retains mechanical toughness, outstanding weatherability, flexibility, and impact resistance without tearing in temperatures ranging from −100 to 225°F. 1 fig.

6316 **Method of adding a malodorant to gases.** Suominen, T.; Smars, E. To AGA (Sweden). 9 Aug 1991. Filed date 9 Feb 1990. Canada Patent patent application 2009716. 9p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

A method is provided for adding an odorant to a consumer gas in order to warn of the existence of a gas leak. The process employs a concentrated gas, called a master gas, in which the odorant is dissolved. The master gas is selected such that the odorant does not condense during transport and storage of the master gas at low temperatures. The odorant is dissolved in the liquid master gas in a pressure vessel to obtain a solution which essentially comprises a gaseous phase and a liquid phase. The master gas is extracted from the liquid phase, vaporized, and added to the gas which is intended to be odorized. When the odorant is dimethyl sulfide, the odorant is used in a concentration of 1-15%, and the extracted vaporized solution is supplied to the consumer gas such that the odorant is present in a concentration of 5-50 ppM. In this case, if the master gas is liquid carbon dioxide, the odorant will remain soluble throughout a temperature range of −40°C to 50°C.

6317 (DOE/BC/14479–7) **Chemically assisted in situ recovery of oil shale: Technical progress report, April 1, 1991–June 30, 1991.** Ramirez, W.F. Colorado Univ., Boulder, CO (United States). Dept. of Chemical Engineering. [1991]. 5p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-89BC14479. Order Number DE92003697. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to investigate, in the laboratory, the parameters associated with a chemically assisted in situ recovery procedure, using hydrogen chloride (HCl), carbon dioxide (CO_2), and steam (H_2O), to obtain data useful to develop a process more economic than existing processes and to report all findings. Quarter summary: all modifications previously planned where completed and a reaction experiment was run. A couple design flaws were discovered, improvements were designed, and all parts are expected in the first week of July. Experiment #6 is expected to run the following Monday. Barring further mishap, experiments will be run one each week thereafter. The project is behind schedule, but the project is well positioned to make significant and considerable progress.

0409 Waste Management

6318 (DOE/MC/11076–3019) **Organic and inorganic hazardous waste stabilization using combusted oil shale.** Sorini, S.S.; Lane, D.C. Western Research Inst., Laramie, WY (United States). Apr 1991. 24p. Sponsored by U.S. DOE Fossil Energy.

DOE Contract FC21-86MC11076. Order Number DE91016652. Source: OSTI; NTIS; GPO Dep.

A laboratory study was conducted at the Western Research Institute to evaluate the ability of combusted oil shale to stabilize organic and inorganic constituents of hazardous wastes. The oil shale used in the research was a western oil shale retorted in an inclined fluidized-bed reactor. Two combustion temperatures were used, 1550°F and 1620°F (843°C and 882°C). The five wastes selected for experimentation were an API separator sludge, creosote-contaminated soil, mixed metal oxide/hydroxide waste, metal-plating sludge, and smelter dust. The API separator sludge and creosote-contaminated soil are US EPA-listed hazardous wastes and contain organic contaminants. The mixed metal oxide/hydroxide waste, metal-plating sludge (also an EPA-listed waste), and smelter dust contain high concentrations of heavy metals. The smelter dust and mixed metal oxide/hydroxide waste fail the Toxicity Characteristic Leaching Procedure (TCLP) for cadmium, and the metalplating sludge fails the TCLP for chromium. To evaluate the ability of the combusted oil shales to stabilize the hazardous wastes, mixtures involving varying amounts of each of the shales with each of the hazardous wastes were prepared, allowed to equilibrate, and then leached with deionized, distilled water. The leachates were analyzed for the hazardous constituent(s) of interest.

6319 (INIS-GB-385) **Fifth annual plutonium figures published.** Department of Energy, London (United Kingdom). 17 Oct 1991 6p. Order Number DE92615027. Source: OSTI; NTIS (US Sales Only); INIS.

The Department of Energy figures for 1990/91 on the plutonium produced at Britain's civil nuclear power stations, reprocessing activities at Sellafield, and the civil plutonium stocks are given. These figures are published annually and are compiled from data supplied by Nuclear Electric plc, Scottish Nuclear Ltd, British Nuclear Fuels plc (BNFL) and the United Kingdom Atomic Energy Authority (UKAEA). Reactor discharges and dispatches from site of irradiated fuel and the stocks of plutonium held in irradiated fuels are listed. BNFL figures show the cumulative stocks of plutonium held in irradiated fuels. 156 kg of separated plutonium was imported from France under the first reactor collaboration. 2210 kg of unseparated plutonium was imported as irradiated fuel. (author).

0501 Reserves, Exploration, and Mining

6320 (CNIC-00449) **Using geoelectrochemical technique to extract uranium and other metals.** Gao Yulong (No.240 Research Inst. of North-East Bureau of Geologic Exploration of Nuclear Industry, Shenyang, LN (China)). China Nuclear Information Centre, Beijing, BJ (China). Oct 1990. 11p. (In Chinese). (NEGE-0001.). Order Number DE92614880. Source: OSTI; NTIS (US Sales Only); INIS.

The geoelectrochemical extraction technique, which is a direct deep exploring method, is one of the geoelectrochemical exploring methods. It is developed recently to explore basic metals, precious metals, rare metals and some nonmetal mineral products. It is also a combination of electrical surveying and geochemical surveying. This method is more useful in the seeking of gold ore deposit. The principle and technique of this method and the results in seeking gold, uranium, lead, nickel and tin ore deposits are introduced. The equipment and instruments used in this method are also given.

6321 (INIS-BR-2854) **Stratigraphy, tectonic and ore potential of pre-cambrian unities from Serro region-MG (Mato Grosso quadrangle).** Assis, L.C. de. Brasilia Univ., DF (Brazil). Dept. de Geociencias. 1982 158p. (In Portuguese). Order Number DE92613469. Source: OSTI; NTIS (US Sales Only); INIS.

Geological and stratigraphic elements of the Proterozoic units of the Serro region, Mato Grosso Quadrangle, show the absence of the faciological transition between the Espinhaco Group and the Minas Supergroup. Occurs in this region is a lithostratigraphical sequence of four distinct units: the Crystalline Basement; the Volcano-Sedimentary Sequence of Serro; the Minas Supergroup. The ore potential of the region includes: quartz veins, within the Galho do Miguel Formation; diamond, within the Sopa conglomerates; gold, in alluvial deposits and remobilized in quartz veins of the Sopa-Brumadinho Formation; bauxite, in the metabasics; uranium in the metaconglomerates of Moeda Formation; iron, in Caue Formation; chromium, gold and base metals in the Volcano-Sedimentary Sequence of Serro. Emphasis is given to the characterization of the Volcano-Sedimentary Sequence of Serro and its mineralization that is characterized as a stratiform massif with important volcano-sedimentary contribution, possible, a greenstone belt, with high gold-bearing potential. (author).

6322 (INIS-BR-2874) **Uranium recovery from phosphate rocks concentrated.** Azevedo, M.F. de. Universidade Federal, Rio de Janeiro, RJ (Brazil). Inst. de Quimica. 1986 62p. (In Portuguese). Order Number DE92613470. Source: OSTI; NTIS (US Sales Only); INIS.

The reserves, geological data, chemical data and technical flowsheet from COPEBRAS and Goiasfertil ores are described, including the process of mining ore concentration. Samples of Goiasfertil ores are analysed by gravimetric analysis, for phosphate, and spectrofluorimetry for uranium. (author).

6323 (INIS-mf-13064) **Methodology of simultaneous analysis of Uranium and Thorium by nuclear and atomic techniques. Application to the Uranium and Thorium dosing in mineralogic samples.** Fakhi, S. (Universite Mohammed 5, Rabat (Morocco). Faculte des Sciences). Universite Mohammed 5, Rabat (Morocco). Faculte des Sciences. 15 Apr 1988 193p. (In French). Order Number DE92613471. Source: OSTI; NTIS (US Sales Only); INIS.

This work concerns essentially the potential applications of 100 kW nuclear reactor of Strasbourg Nuclear Research Centre to neutron activation analysis of Uranium and Thorium. The Uranium dosing has been made using: 239-U, 239-Np, fission products or delayed neutrons. Thorium has been showed up by means of 233-Th or 233-Pa. The 239-U and 233-Th detection leads to a rapid and non-destructive analysis of Uranium and Thorium. The maximum sensitivity is of 78 ng for Uranium and of 160 ng for Thorium. The Uranium and Thorium dosing based on 239-Np and 233-Pa detection needs chemical selective separations for each of these radionuclides. The liquid-liquid extraction has permitted to elaborate rapid and quantitative separation methods. The sensitivities of the analysis after extraction reach 30 ng for Uranium and 50 ng for Thorium. The fission products separation study has allowed to elaborate the La, Ce and Nd extractions and its application to the Uranium dosing gives satisfying results. A rapid dosing method with a sensitivity of 0.35 microgramme has been elaborated with the help of delayed neutrons measurement. These different methods have been applied to the Uranium and Thorium dosing in samples coming from Oklo mine in Gabon. The analyses of these samples by atomic absorption spectroscopy and by the proton induced X-ray emission (PIXE) method confirm that the neutron activation analysis methods are reliable. 37 figs., 14 tabs., 50 refs.

6324 (CNIC-00395) **The exploration on the new process of hydrofluorination of uranium dioxide.** Zhao Jun (Tianjin Univ. (China)); Zhao Siyuan; Shen Guohong. China Nuclear Information Centre, Beijing, BJ (China). Apr 1990. 11p. (In Chinese). (TU-0010.). Order Number DE92613387. Source: OSTI; NTIS (US Sales Only); INIS.

The optimum treatment of the reaction conditions were achieved based on the kinetic data of the hydrofluorination of uranium dioxide (material obtained from uranyl nitrate by one step denitration-reduction process) and the flow characteristic of reactor. A new process is proposed that is the stirred bed (exhaust gas section) in series with fluidized bed (production section). The optimum design and experimental study of operation conditions of the stirred bed reactor have been completed. The results of hot modelling test of the stirred bed reactor showed that the conversion of UO_2 to UF_4 in the exit stream was 47≈50% and the hydrogen fluoride remaining in the exhaust gas was less than 5%. Comparision with the circuit of two fluidized beds in series showed that the conversion of stirred bed was nearly same as the first fluidized bed but the hydrogen fluoride remaining in the exhaust gas was considerably decreased.

6325 (CNIC–00426) **Ion exchange resin fouling of molybdenum in recovery uranium processess.** Zhang Guowei (Beijing Research Inst. of Uranium Ore Processing (China)); Zhao Guirong. China Nuclear Information Centre, Beijing, BJ (China). Sep 1990. 13p. (In Chinese). (BRIUOP–0011.). Order Number DE92613388. Source: OSTI; NTIS (US Sales Only); INIS.

The relationship between anion exchange resin fouling and molybdic acid polymerization was studied. By using potentiometer titration and laser-Raman spectroscopy the relationship of molybdic acid polymerization and the pH value of solution or the molybdenum concentration was determined. It was shown that as the concentration of initial molybdenum in solution decreases from 0.2 mol/L to 0.5 mmol/L, the pH value of starting polymerization decreased from 6.5 to 4.5. The experimental results show that the fouling of 201 x 7 resin in the acidic solution is mainly caused by the adsorbing of $Mo_3O_{26}^{4-}$ ion and occupying the exchange radical site of the resin. Under the leaching conditions the molybdenum and phosphate existing in the leaching liquor can form 12-molybdophosphate ion. It also leads to resin fouling. The molybdenum on the fouled resin can synergically be desorbed by mixed desorbents containing ammonium hydroxide and ammonium sulfate. The desorbed resin can be used for uranium adsorption and the desorbed molybdenum can be recovered by ion exchange method.

6326 (CNIC–00430) **Ferric sulphate leaching process for uranium ore.** Cai Ximin (Beijing Research Institute of Chemical Engineering and Metallurgy (China)). China Nuclear Information Centre, Beijing, BJ (China). Sep 1990. 8p. (In Chinese). (BICM–0001.). Order Number DE92613389. Source: OSTI; NTIS (US Sales Only); INIS.

A process using the ferric sulphate solution as a leaching agent to the uranium ore which was exploited in the south part of Hunan province was studied. The ore mainly contains uraninite. Comparing with the conventional sulphuric acid leching method, this process reduced the acid consumption about 30≈40%, and dissolved solids 15≈20%. The ferric leaching agent can cyclically be used by the ferrous oxidant bacteria. From the results of six cycles, it indicated that the ferric leaching ageng does not interfere the leaching results of uranium.

6327 (ORNL/TM–11792) **Reaction of uranium oxides with chlorine and carbon or carbon monoxide to prepare uranium chlorides.** Haas, P.A.; Lee, D.D.; Mailen, J.C. Oak Ridge National Lab., TN (United States). Nov 1991. 61p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE92004886. Source: OSTI; NTIS; GPO Dep.

The preferred preparation concept of uranium metal for feed to an AVLIS uranium enrichment process requires preparation of uranium tetrachloride (UCl_4) by reacting uranium oxides (UO_2/UO_3) and chlorine (Cl_2) in a molten chloride salt medium. UO_2 is a very stable metal oxide; thus, the chemical conversion requires both a chlorinating agent and a reducing agent that gives an oxide product which is much more stable than the corresponding chloride. Experimental studies in a quartz reactor of 4-cm ID have demonstrated the practically of some chemical flow sheets. Experimentation has illustrated a sequence of results concerning the chemical flow sheets. Tests with a graphite block at 850°C demonstrated rapid reactions of Cl_2 and evolution of carbon dioxide (CO_2) as a product. Use of carbon monoxide (CO) as the reducing agent also gave rapid reactions of Cl_2 and formation of CO_2 at lower temperatures, but the reduction reactions were slower than the chlorinations. Carbon powder in the molten salt melt gave higher rates of reduction and better steady state utilization of Cl_2. Addition of UO_2 feed while chlorination was in progress greatly improved the operation by avoiding the plugging effects from high UO_2 concentrations and the poor Cl_2 utilizations from low UO_2 concentrations. An UO_3 feed gave undesirable effects while a feed of UO_2-C spheres was excellent. The UO_2-C spheres also gave good rates of reaction as a fixed bed without any molten chloride salt. Results with a larger reactor and a bottom condenser for volatilized uranium show collection of condensed uranium chlorides as a loose powder and chlorine utilizations of 95–98% at high feed rates. 14 refs., 7 figs., 14 tabs.

A new section, 10 CFR 74.33, has been added to the material control and accounting (MC&A) requirements of 10 CFR Part 74. This new section pertains to US Nuclear Regulatory Commission (NRC)-licensed uranium enrichment facilities that are authorized to produce and to possess more than one effective kilogram of special nuclear material (SNM) of low strategic significance. The new section is patterned after 10 CFR 74.31, which pertains to NRC licensees (other than production or utilization facilities licensed pursuant to 10 CFR Part 50 and 70 and waste disposal facilities) that are authorized to possess and use more than one effective kilogram of unencapsulated SNM of low strategic significance. Because enrichment facilities have the potential capability of producing SNM of moderate strategic significance and also strategic SNM, certain performance objectives and MC&A system capabilities are required in 10 CFR 74.33 that are not contained in 10 CFR 74.31. This document recommends to the NRC information that the licensee or applicant should provide in the fundamental nuclear material control (FNMC) plan. This document also describes methods that should be acceptable for compliance with the general performance objectives. While this document is intended to cover various uranium enrichment technologies, the primary focus at this time is gas centrifuge and gaseous diffusion.

6329 (DOE/NS–0002P) **Report of an investigation into deterioration of the Plutonium Fuel Form Fabrication Facility (PuFF) at the DOE Savannah River Site.** USDOE Office of Nuclear Safety, Washington, DC (United States). Oct 1991. 160p. Sponsored by U.S. DOE Nuclear Safety. Order Number DE92002946. Source: OSTI; NTIS; INIS; GPO Dep.

This investigations of the Savannah River Site's Plutonium Fuel Form fabrication facility located in Building 235-F was initiated in April 1991. The purpose of the investigation was to determine whether, as has been alleged, operation of the facility's argon inert gas system was terminated with the knowledge that continued inoperability of the argon system would cause accelerated corrosion damage to the equipment in the plutonium 238 processing cells. The investigation quickly established that the decision to discontinue operation of the argon system, by not repairing it, was merely one of the measures, and not the most important one, which led to the current deteriorated state of the facility. As a result, the scope of the investigation was broadened to more identify and assess those factors which contributed to the facility's current condition. This document discusses the backgrounds, results, and recommendations of this investigation.

6330 (HAN–42598-Del.) **Weekly report for period February 1 to February 7, 1950 inclusive.** Christy, J.T. Hanford Works, Richland, WA (United States). 8 Feb 1950. 100p. Sponsored by

6332 (HW–50266-RD-Del.) **Separation plant effluent gas measurements for determining plutonium production rate.** Schwendiman, L.C. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 20 May 1957. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004558. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The use of ion chambers or proportional beta counters is recommended for the measurement of Kr^{85} in separations plant gaseous effluent. It will be necessary to evaluate the Xe^{133} present if short cooling times (less than about 90 days) since irradiation are used. This can be accomplished through calibration and decay measurements. It is concluded that the Kr^{85} evolution could be determined to about ±5% with careful measurements.

6333 (WHC-SA–1379) **Calculation of the Fast Flux Test Facility fuel pin tests with the WIMS-E and MCNP codes.** Schwinkendorf, K.N.; Wittekind, W.D.; Toffer, H. Westinghouse Hanford Co., Richland, WA (United States). Oct 1991. 13p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-920308–5: Advances in reactor physics, Charleston, SC (United States), 8-11 Mar 1992). Order Number DE92002915. Source: OSTI; NTIS; INIS; GPO Dep.

The Fuel Assembly Area (FAA) at the Fast Flux Test Facility site on the Hanford Site at Richland, Washington currently is being prepared to fabricate mixed oxide fuel (U, Pu) for the FFTF. Calculational tools are required to perform criticality safety analyses for various process locations and to establish safe limits for fissile material handling at the FAA. These codes require validation against experimental data appropriate for the compositions that will be handled. Critical array experiments performed by Bierman provide such data for mixed oxide fuel in the range Pu/(U+Pu) = 22 wt %, and with Pu-240 contents equal to 12 wt %. Both the Monte Carlo Neutron Photon (MCNP) and the Winfrith Improved Multigroup Scheme (WIMS-E) computer codes were used to calculate the neutron multiplication factor for explicit models of the various critical arrays. The W-CACTUS modules within the WIMS-E code system was used to calculate k_∞ for the explicit array configuration, as well as few-group cross sections that were then used in a three-dimensional diffusion theory code for the calculation of k_{eff} for the finite array. 10 refs., 15 figs., 7 tabs.

0508 Spent Fuels Reprocessing

6334 (DOE/RL–90-24-Vol.1-Rev.1) **PUREX Storage Tunnels dangerous waste permit application: Revision 1, Volume 1.** USDOE Richland Operations Office, WA (United States). Dec 1991. 262p. Sponsored by U.S. DOE Defense Programs; U.S. DOE Environment Safety & Health. DOE Contract AC06-87RL10930. Order Number DE92004155. Source: OSTI; NTIS; INIS; GPO Dep.

The PUREX Storage Tunnels are a mixed waste storage unit consisting of two underground railroad tunnels: Tunnel Number 1 designated 218-E-14 and Tunnel Number 2 designated 218-E-15. The two tunnels are connected by rail to the PUREX Plant and combine to provide storage space for 48 railroad cars (railcars). The PUREX Storage Tunnels provide a long-term storage location for equipment removed from the PUREX Plant. Transfers into the PUREX Storage Tunnels are made on an as-needed basis. Radioactively contaminated equipment is loaded on railcars and remotely transferred by rail into the PUREX Storage Tunnels. Railcars act as both a transport means and a storage platform for equipment placed into the tunnels. This report consists of part A and part B. Part A reports on amounts and locations of the mixed water. Part B permit application consists of the following: Facility Description and General Provisions; Waste Characteristics; Process Information; Groundwater Monitoring; Procedures to Prevent Hazards; Contingency Plan; Personnel Training; Exposure Information Report.

6335 (ESG-DOE–13276) **AIROX dry reprocessing of uranium oxide fuels.** Hoyt, R.C. (Rockwell International Corp., Canoga Park, CA (United States). Energy Systems Group); Grantham, L.F.; Clark, R.G.; Twichell, P.W. Rockwell International Corp., Canoga Park, CA (United States). Energy Systems Group; Argonne National Lab., IL (United States). 12 Jul 1979. 118p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AT03-76SF70013 ;W-31109-ENG-38. Order Number DE92004037. Source: OSTI; NTIS; GPO Dep.

The AIROX pyrochemical dry reprocessing method has been shown to be a highly proliferation resistant means of utilizing fissile material in spent nuclear fuel. Fuel cycles based upon this reprocessing method have been developed for both LWR and FBR fuel. Process analysis with computer codes has determined the relative importance of removing specific fission products and has established that new fuel management strategies need to be developed for fuels recycles with fission products. Process conditions have been optimized with respect to pellet pulverization and reaction rates by performing tests on unirradiated UO_2. These tests yielded a product which is sufficiently pulverized for complete decladding, without production of extremely fine particles to cause dusting problems. An analysis has indicated that the product should not be contaminated with cladding material, and that waste treatment can be accomplished with the technology being developed for aqueous processing facilities. It appears that waste produced during dry reprocessing will be significantly easier to treat and consist of smaller volumes than those produced by conventional aqueous reprocessing facilities.

6336 (ESG-DOE–13277) **Review of the literature for dry reprocessing oxide, metal, and carbide fuel: The AIROX, RAHYD, and CARBOX pyrochemical processes.** Hoyt, R.C. (Rockwell International Corp., Canoga Park, CA (United States). Energy Systems Group); Rhee, B.W. Argonne National Lab., IL (United States); Rockwell International Corp., Canoga Park, CA (United States). Energy Systems Group. 30 Sep 1979. 226p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AT03-76SF70013. Order Number DE92004038. Source: OSTI; NTIS; GPO Dep.

The state of the art of dry processing oxide, carbide, and metal fuel has been determined through an extensive literature review. Dry processing in one of the most proliferation resistant fuel reprocessing technologies available to date, and is one of the few which can be exported to other countries. Feasibility has been established for oxide, carbide, and metal fuel on a laboratory scale, and large-scale experiments on oxide and carbide fuel have shown viability of the dry processing concept. A complete dry processing cycle has been demonstrated by multicycle processing-refabrication-reirradiation experiments on oxide fuel. Additional experimental work is necessary to: (1) demonstrate the complete fuel cycle for carbide and metal fuel, (2) optimize dry processing conditions, and (3) establish fission product behavior. Dry process waste management is easier than for an aqueous processing facility since wastes are primarily solids and gases. Waste treatment can be accomplished by techniques which have been, or are being, developed for aqueous plants.

6342 (HW–31005) **A brief review of major problems at Redox.** Maider, J.E. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 2 Mar 1954. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004552. Source: OSTI; NTIS (US Sales Only); GPO Dep.

During the last few months the Redox plant has been plagued with an excessive number of problems which have resulted in its inability to meet forecasted production schedules in November 1953, January and February 1954. The following paragraphs are intended to indicate some of the problems faced at Redox and the steps that are being taken to remedy them. It should be emphasized that the plant has been operating far above original design capacity and this fact tends to aggravate some of the problems. For example, although steps have been taken to increase the throughput capacity of certain of the head-end steps and some of the columns, it is most possible to install a second centrifuge, oxidizer or D-12 waste evaporator in parallel so that when any of these – one of a kind – pieces of equipment is out of service the entire plant is unable to operate.

6343 (HW–31417) **Redox Plant—Ruthenium contamination control.** Maider, J.E. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 9 Apr 1954. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004553. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses ruthenium releases from the Redox plant in 1954. Plans for the controlling the release of ruthenium to the stack is summarized. (JL)

6344 (HW–31514) **Redox Plant—Ruthenium contamination control.** Maider, J.E. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 19 Apr 1954. 2p. This paper briefly reaccounts principal progress items addressed at a April 1954 meeting on ruthenium release and abatement measures for the Redox Plant at the Hanford Engineer Works. (JL)

6345 (HW–32056) **Redox Plant—Ruthenium contamination control.** Maider, J.E. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 7 Jun 1954. 2p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004555. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report consists of a brief memo discussing ruthenium release,and abatement measures at the Redox Plant in 1954. (JL)

6346 (HW–34216) **Redox decontamination performance.** Irish, E.R. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 23 Dec 1954. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004977. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Since start-up of the Redox Plant, different types of decontamination difficulties have been experienced and corrective measures taken. Current decontamination performance is superior to that ever experienced before. However, with the apparent need for the for elimination of the permanganate Head-End process for the IAF oxidation, several modifications to the plant flowsheet and equipment have been planned in order to obtain satisfactory overall decontamination without permanganate Head-End. The objectives of the memorandum are: to summarize generally and briefly the decontamination experience of the Redox process operating on IAF oxidized by sodium dichromate; to indicate the decontamination which probably can be obtained with the new Phase 2 equipment and its improved performance; and to re-evaluate the timing and feasibility of the current approaches for solving the long-range Redox decontamination problems arising as a result of oxidation of IAF by sodium dichromate (vice potassium permanganate).

6347 (HW–35445) **Items for over-all Redox contamination improvement.** Rohrmann, C.A.; Wilson, B.D.; Merrill, E.T. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 13 Jan 1955. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004557. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In view of contamination difficulties within the Redox operation, number of items are being considered to improve this situation. It is the objective of this document to list and describe seven times which it is felt would contribute most toward improvement. It is also an objective to present for RDS-D-12 Group consideration the recommendations of representatives from Manufacturing, Technical, and Design in these matters with the expectation that a project proposal written in general terms for overall contamination improvement would be prepared.

6348 (HW–50241) **Flowsheet No. 1: Cesium isolation and packaging.** Wirta, R.W.; Koski, O.H. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 20 May 1957. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92003505. Source: OSTI; NTIS (US Sales Only); GPO Dep.

An engineering flowsheet has been prepared for the conversion of an aqueous slurry of cesium-zinc-ferrocyanide into a dry cesium chloride product by the calcination process. Flowsheet No. 1 defines a six-step batch-type calcination operation for processing the slurry into a dry powder for offsite shipment in bulk containers. Some of the advantages to this process are as follows: Product losses are expected to be small, estimated to be less than 0.03 percent; the equipment required to process a given number of curies per batch appears to be relatively small, compact, and simple; the process does not impose severe requirements for materials of construction; and requirements for process control and instrumentation are expected to be simple. There are two disadvantages to this process. First, the cesium-zinc-ferrocyanide precipitate is not considered economically filterable, hence, the separation of solids from liquids is encumbered. Second, the process, as outlined, if potentially hazardous because of the possible nitrate carry-over with the influent slurry. This nitrate may cause a rapid reaction in the calcination step. It is concluded that this flowsheet offers a satisfactory scheme for isolating radiocesium if the process is modified to preclude the possibility of nitrates or other unwanted oxidants from reaching the calcination step. 1 fig.

6349 (HW–54005) **A plant weekly summary—Purex operation, January 6, 1958–December 29, 1958.** Schroeder, O.C. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 6 Jan 1958. 51p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004559. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report contains the weekly summaries for the Purex process at the Hanford Engineer Works for January 6, 1958 to December 29, 1958. Each summary includes uranium production, maximum operating rate, and waste loss statistics as well as an operating experience briefing. (JL)

6350 (HW–55014-RD) **E-metal dissolvers, Redox.** Tomlinson, R.E. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 19 Feb 1958. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004560. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In December 1957, the proposal for Project CG-772, "E-Metal Dissolvers – Redox" was returned for reconsideration in order that the units might be designed to accommodate higher enrichment fuels, if practical. Alternate design approaches have been under consideration since that time. It is the purpose of this document to summarize the parameters involved and to present the recommendation developed from the joint thinking of Hanford Laboratories, Research and Engineering, Facilities Engineering, and Redox Operation.

6351 (HW–55455) **Revised definitive process design, E-metal dissolver equipment, Redox Facility.** Graf, W.A. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 31 Mar 1958. 11p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC06-76RL01830. Order Number DE92004561. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this report is to present the revised process design to be used as the basis for the detail design of Redox dissolvers each of which shall meet the following: Process irradiated natural uranium slugs (standard Hanford or I&E type) at 43% of Phase II Redox production rates; process irradiated enriched uranium up to .94% U^{235} isotopic content in slugs (standard Hanford or I&E type) at rates up to 43% of Phase II capacity; and process irradiated fuel elements of cluster design from new reactors with cladding material of aluminum or zirconium, enrichments to .94% U^{235} and dimensions of ten feet long and 10 inches square. This report is also to form the basis for slug distribution tests to be performed by HLO concurrent with the final design effort.

6352 (HW–60143) **Definitive process design, Redox multipurpose dissolver installation.** Gustafson, L.D. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 6 May 1959. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004562. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document provides the required definitive scope design for dissolver equipment capable of nuclear safe processing by geometry of E-Metal and certain other fuels enriched to a maximum of one per cent U-235 equivalent. Using only a single dissolver installation of this design, it will be possible to process the current E-Metal monthly commitment in less than two weeks (five-day week). The proposed dissolver system is to incorporate design flexibility required to permit conversion to Zirflex processing of NPR fuels.

6353 (HW–89083) **Hanford Site process flow diagrams, 1958.** Gydesen, S.P. (comp.). General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. Dec 1991. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004563. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report consists of flow diagrams extracted from the General Managers Data Book and prepared as a separate document that graphically depicts in lay language the site operation in 1958. (JL)

Source: OSTI; NTIS (US Sales Only); INIS.

The extraction chemistry of the actinide ions and the inorganic acids with amides, N,N-dialkylamides (RRNCOR') and N,N'-tetraalkyl 2-alkyl propane diamides $(RR'NCO)_2$ CHR^{bar} is reviewed. Examples of application of those extractants in the separation of the nuclear industry are given. The monoamides are advantageous alternative to tributylphosphate and the diamides useful for the alpha TRU waste decontamination. The most interesting aspect of these extractants are the innocuity of their radiolytic products and the possibility to incinerate the used solvents without large amounts of inorganic residues as for the organophosphorus extractants. (author). 13 refs., 7 tabs., 7 figs.

The back end of the fuel cycle assumes greater importance to facilitate closing of the fuel cycle. The decision regarding the choice of the fuel cycle is influenced by many factors such as the technology, the economics, the environmental impact, the proliferation risk, the scale of the nuclear programme, the national energy strategy etc. Countries like France, United Kingdom, Germany, USSR, Japan and India have shown preference for the reprocess-recycle option whereas the policy in USA, Canada, Italy, Sweden and Italy is for long term storage keeping wide open the options of reprocessing or disposal at a later date. Some of the technological aspects in this choice are discussed in this paper. (author). 1 tab.

6356 (INIS-mf–13025 vp.) **Developments and automation in purex process control analytical measurement systems (Preprint no. IT-20).** Ramanujam, A. (Bhabha Atomic Research Centre, Bombay (India). Source: OSTI; NTIS (US Sales Only); INIS.

The fuel reprocessing facility based on purex process depends on efficient process control analytical measurement systems for its successful operation. The process control laboratory plays a vital role in catering to these requirements. This paper describes the various efforts put in to improve its performance capabilities in three major areas of operation, viz. sample handling, analytical and data processing. In developing automation aids and analytical techniques, apart from the special emphasis put on reduction in personnel exposure to radiation and time required for analysis, due consideration has been given to operational reliability and safety of the system. (author). 15 refs., 4 tabs., 3 figs.

Source: OSTI; NTIS (US Sales Only); INIS.

Reactor fuels have conventionally been reprocessed by the Purex process, which involves the dissolution of the fuel in nitric acid followed by solvent extraction using tri-n-butylphosphate for the recovery of uranium and plutonium. The presence of large concentrations of plutonium in the process steps of fast reactor fuel reprocessing introduces a number of new considerations in design of flowsheets, that do not usually apply to thermal reactor fuel reprocessing. This paper tries to higlight some of these aspects, and also presents a brief account of the studies carried out in this area in the Radiochemistry Programme (RCP) at IGCAR. (author). 19 refs., 1 tab., 5 figs.

6359 (JAERI-M–91-144) **Safety analysis of solvent fire accidents in a fuel reprocessing plant.** Nishio, Gunji (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Yamazaki, Noboru. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1991. 157p. (In Japanese). Order Number DE92751027. Source: OSTI; NTIS (US Sales Only); INIS.

For analyzing the safety evaluation of solvent fire as DBA in an extraction process of nuclear fuel reprocessing plant, computer code named FACE was developed in JAERI under the auspices of the Science and Technology Agency of Japan. The code FACE can provide not only for calculations of temperature, pressure, flow rate and pressure drop in cells and ducts of the network in air-ventilation system by one- and two-dimensional analyses and smoke containing radioactive materials by burning solvent in the network but also for solvent fire behavior in the cell, transport of radioactive materials and its deposition in the network, integrity of HEPA filters, and release of radioactive materials to the environment. Calculations by FACE were compared with data obtained by large-scale demonstration tests in JAERI simulating solvent fire in the extraction process to verify mathematical modeling of the fire accident in the code. (author).

6360 (JAERI-M–91-145) **Safety demonstration tests of solvent fire accidents in a fuel reprocessing plant.** Takada, Junichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Koike, Tadao; Tukamoto, Michio; Nishio, Gunji; Uno, Seiichiro; Kamoshida, Atsushi; Watanabe, Hironori; Hashimoto, Kazuichiro; Kitani, Susumu. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1991. 203p. (In Japanese). Order Number DE92751028. Source: OSTI; NTIS (US Sales Only); INIS.

Demonstration tests to evaluate the safety of air-ventilation system for hypothetical solvent fire in a cell as DBA in an extraction process of nuclear fuel reprocessing plant were carried out by a large-scale fire and filter facility (FFF) in JAERI under the auspices of the Science and Technology Agency of Japan. Demonstration test data were obtained by focusing on fire behavior during solvent burning in the cell, generation of smoke containing simulant fission products from flame, transport and deposition of smoke in ducts, confinement of radioactive materials in the ventilation system and integrity of HEPA filters by using a fire and filter facility simulating a ventilation system of reference reprocessing plant in Japan. The results of the test in the present report were ready for verification of computer codes which evaluate the safety of a reprocessing plant in solvent fire accidents. (author).

6361 (PNL-SA–19681) **Batch testing of the TRUEX process on some unique Hanford wastes and of the TRUEX and SREX processes on commercial fuel reprocessing high-level waste.** Swanson, J.L.; Lumetta, G.J. Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 32p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-911049–3: 7. symposium on separation science and technology for energy applications, Knoxville, TN (United States), 20-24 Oct 1991). Order Number DE92002698. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses testing of the TRUEX process on Hanford wastes, and reprocessing of commercial fuel high-level wastes. The objectives of the study were to: test acid dissolution and TRUEX processing on Hanford neutralized cladding removal waste (NCRW); determine if TRUEX solvent becomes "poisoned" by Hanford complexant concentrate (CC) waste; test TRUEX on light-water reactor (LWR) fuel, PUREX high-level wastes; and test SREX on LWR fuel, PUREX and TRUEX high-level wastes. (JL)

0509 Transport, Handling, and Storage

6362 (CONF-9110117–) **Uranium hexafluoride handling: Proceedings.** Oak Ridge National Lab., TN (United States). [1991]. 295p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. From 2. international conference on uranium hexafluoride handling; Oak Ridge, TN (United States); 29-31 Oct 1991. Order Number DE92005283. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy, Oak Ridge Field Office, and Martin Marietta Energy Systems, Inc., are co-sponsoring this Second International Conference on Uranium Hexafluoride Handling. The conference is offered as a forum for the exchange of information and concepts regarding the technical and regulatory issues and the safety aspects which relate to the handling of uranium hexafluoride. Through the papers presented here, we attempt not only to share technological advances and lessons learned, but also to demonstrate that we are concerned about the health and safety of our workers and the public, and are good stewards of the environment in which we all work and live. These proceedings are a compilation of the work of many experts in that phase of world-wide industry which comprises the nuclear fuel cycle. Their experience spans the entire range over which uranium hexafluoride is involved in the fuel cycle, from the production of UF_6 from the naturally-occurring oxide to its re-conversion to oxide for reactor fuels. The papers furnish insights into the chemical, physical, and nuclear properties of uranium hexafluoride as they influence its transport, storage, and the design and operation of plant-scale facilities for production, processing, and conversion to oxide. The papers demonstrate, in an industry often cited for its excellent safety record, continuing efforts to further improve safety in all areas of handling uranium hexafluoride.

6363 (KAERI-II/RR–28/90) **A safety study on spent fuel management: A study on the fluid-structure interaction modeling of spent fuel storage pool.** Shim, Jae Ku (Korea Atomic

Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Jhin Wung; Seo, Jeong Moon; Choun, Young Sun; Kim, Dae Hong; Choi, In Gil; Hwang Shin Il. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jun 1991. 104p. (In Korean). Order Number DE92615159. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this study is to suggest a rational method of analysis for the fluid-structure interaction of a spent fuel storage pool under earthquake loading taking into consideration of the structural responses obtained from various analysis methods and modeling techniques. A literature review, an introduction of the theory of fluid-structure interaction, a presentation of several analytical and finite element models, a comparison of the results from each model are included. For the dynamic analysis of the spent fuel storage pool three uncoupled and four coupled models are considered and response spectrum analysis method and time history analysis method are used. Based on the results of the study on various analysis models, the coupled model which utilizes the chracteristics of contact surface is concluded as the most reasonable one for the analysis of fluid-structure interaction. (Author).

6364 (NUREG–0383-Vol.3-Rev.11) **Directory of certificates of compliance for radioactive materials packages: Report of NRC approved quality assurance programs for radioactive materials packages: Volume 3, Revision 11.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safeguards and Transportation. Oct 1991. 146p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This directory contains a Report of NRC Approved Packages (Volume 1), Certificates of Compliance (Volume 2), and Report of NRC Approved Quality Assurance Programs for Radioactive Materials Packages (Volume 3). The purpose of this directory is to make available a convenient source of information on Quality Assurance Programs and Packagings which have been approved by the US Nuclear Regulatory Commission. Shipments of radioactive material utilizing these packagings must be in accordance with the provisions of 49 CFR §173.471 and 10 CFR Part 71, as applicable. In satisfying the requirements of Section 71.12., it is the responsibility of the licensees to insure themselves that they have a copy of the current approval and conduct their transportation activities in accordance with an NRC approved quality assurance program.

6365 (RFP–4530) **Supercritical fluid carbon dioxide cleaning of plutonium parts.** Hale, S.J. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1991]. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC34-90DP62349. (CONF-911273–1: Solvent substitution workshop, Phoenix, AZ (United States), 12 Dec 1991). Order Number DE92004003. Source: OSTI; NTIS; GPO Dep.

Supercritical fluid carbon dioxide is under investigation in this work for use as a cleaning solvent for the final cleaning of plutonium parts. These parts must be free of organic residue to avoid corrosion in the stockpile. Initial studies on stainless steel and full-scale mock-up parts indicate that the oils of interest are easily and adequately cleaned from the metal surfaces with supercritical fluid carbon dioxide. Results from compatibility studies show that undesirable oxidation or other surface reactions are not occurring during exposure of plutonium to the supercritical fluid. Cleaning studies indicate that the oils of interest are removed from the plutonium surface under relatively mild conditions. These studies indicate that supercritical fluid carbon dioxide is a very promising cleaning medium for this application.

0510 Economic, Industrial, and Business Aspects

6366 (DOE/RW–0006-Rev.7) **Integrated Data Base for 1991: US spent fuel and radioactive waste inventories, projections, and characteristics: Revision 7.** Oak Ridge National Lab., TN (United States). Oct 1991. 310p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management; U.S. DOE Radioactive Waste Management. DOE Contract AC05-84OR21400. Source: INIS; OSTI (Free of Charge).

The Integrated Data Base (IDB) Program has compiled current data on inventories and characteristics of commercial spent fuel and both commercial and US government-owned radioactive wastes through December 31, 1990. These data are based on the most reliable information available form government sources, the open literature, technical reports, and direct contacts. The current projections of future waste and spent fuel to be generated generally through the year 2020 and characteristics of these materials are also presented. The information forecasted is consistent with the latest US Department of Energy/Energy Information Administration (DOE/EIA) projections of US commercial nuclear power growth and the expected DOE-related and private industrial and institutional (I/I) activities. The radioactive materials considered are spent fuel, high-level waste, transuranic waste, low-level waste, commercial uranium mill tailings, environmental restoration wastes, commercial reactor and fuel cycle facility decommissioning wastes, and mixed (hazardous and radioactive) low-level waste. For most of these categories, current and projected inventories are given through the year 2020, and the radioactivity and thermal power are calculated based on reported or estimated isotopic compositions. In addition, characteristics and current inventories are reported for miscellaneous radioactive materials that may require geologic disposal. 160 refs., 61 figs., 142 tabs.

6367 (ANL/CP–72834) **Thermally unstable complexants: Stability of lanthanide/actinide complexes, thermal instability of the ligands, and applications in actinide separations.** Nash, K.L.; Rickert, P.G. Argonne National Lab., IL (United States). [1991]. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-911049–4: 7. symposium on separation science and technology for energy applications, Knoxville, TN (United States), 20-24 Oct 1991). Order Number DE92004701. Source: OSTI; NTIS; GPO Dep.

Water soluble complexing agents are commonly used in separations to enhance the selectivity of both ion exchange and solvent extraction processes. Applications of this type in the treatment of nuclear wastes using conventional complexing agents have found mixed success due to the nature of the complexants. In addition, the residual solutions containing these species have led to potentially serious complications in waste storage. To overcome some of the limitations of carboxylic acid and aminopolycarboxylate ligands, we have initiated a program to investigate the complexing ability, thermal/oxidative instability, and separation potential of a group of water soluble organophosphorus compounds which we call Thermally Unstable Complexants, or simply TUCS. Complexants of this type appear to be superior to conventional analogues in a number of respects. In this report, we will summarize our research to date on the actinide/lanthanide complexes with a series of substituted methanediphosphonic acids, the kinetics of their oxidative decomposition, and a few applications which have been developed for their use. 17 refs., 5 figs., 3 tab.

6368 (ANL/CP–72981) **Progress in assessing the effect of ionizing radiation on the anticipated waste package environment at the Yucca Mountain potential repository site.** Reed, D.T. Argonne National Lab., IL (United States). [1991]. 11p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-31109-ENG-38 ;W-7405-ENG-48. (CONF-910945–6: Focus '91: nuclear waste packaging, Las Vegas, NV (United States), 29 Sep - 4 oct 1991). Order Number DE92004722. Source: OSTI; NTIS; INIS; GPO Dep.

Progress in establishing the effect of ionizing radiation on the expected air/water vapor waste package environment is summarized. This work was performed at Argonne National Laboratory (ANL) in support of the Yucca Mountain Site Characterization Project. The radiolytic issues that have been identified are presented. Long-term gamma experiments with gas compositions ranging from dry air to high-humidity air were completed. The predominant nitrogen fixation products in all air-like systems studied were nitrogen dioxide and nitric acid. Yields between 0.8 and 2.3 molec/100 eV have been measured. Ammonia formation, although not predominant, was also observed at temperature below 100°C. The ammonia yields were low, and the concentration did not build up with increased absorbed dose. The status of the issues identified is given.

6369 (BfS-ET–9/91) **ANKONA - program for computational testing of requirements of radioactive waste to be disposed in the planned final storage facility Konrad. Version as of November 1990.** Berg, H.P. (Bundesamt fuer Strahlenschutz, Braunschweig (Germany). Fachbereich Nukleare Entsorgung und Transport); Fischer, H.; Piefke, F. Bundesamt fuer Strahlenschutz, Salzgitter (Germany). May 1991. 143p. (In German). Order Number DE92750119. Source: OSTI; NTIS (US Sales Only); INIS.

Radioactive waste to be disposed of in the planned Konrad repository has to fulfil requirements which result from the analyses of the normal operation, of assumed incidents, of the termal influence of the host rock and of the critically safety. These requirements include limits of activity of groups of radionuclides and single radionuclides, which are determined by the properties of the waste packages. The program package ANKONA was developed in order to examine the requirements by means of a personal computer. Only the necessary data of the waste package, for example the waste form group and the type of waste container, have to be provided. The result of the examination is displayed on the screen and optionally printed. In case of the subprogram ANKONA, the examination is performed via dialogue, while the subprogram NUKONA automatically examines a given radionuclide vector on the basis of the provided data. This radionuclide vector can be established by the third subprogram NUKEIN. (orig.).

6370 (CONF-880839–Ses.2, pp. 36-51) **Methodology for assessing performance of waste management systems.** Meshkov, N.K. (Argonne National Lab., IL (USA)); Herzenberg, C.L.; Camasta, S.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). Dec 1988. DOE Contract W-31109-ENG-38. From 10. annual Department of Energy (DOE) low-level waste management conference; Denver, CO (United States); 30 Aug - 1 sep 1988. In *Proceedings of the tenth annual DOE low-level waste management conference. Session 2: Site performance assessment.* 161p. Order Number DE89005580. Source: OSTI.

The newly revised draft DOE Order 5820.2, Chapter 3, requires that DOE low-level waste shall be managed on a systematic basis using the most appropriate combination of waste generation reduction, segregation, treatment, and disposal practices so that the radioactive components are contained and the overall cost effectiveness is minimized. This order expects each site to prepare and maintain an overall waste management systems performance assessment supporting the combination of waste management practices used in generation reduction segregation, treatment, packaging, storage, and disposal. A document prepared by EG and G Idaho, Inc. for the Department of Energy called Guidance for Conduct of Waste Management Systems Performance Assessment is specifically intended to provide the approach necessary to meet the systems performance assessment requirement of DOE Order 5820.2, Chapter 3, and other applicable state regulations dealing with LLW (low-level radioactive wastes). Methods and procedures are needed for assessing the performance of a waste management system. This report addresses this need. The purpose of the methodology provided in this report is to select the optimal way to manage particular sets of waste streams from generation to disposal in a safe and cost-effective manner, and thereby assist the DOE LLW mangers in complying with the DOE Order 5820.2, Chapter 3, and the associated guidance document.

6371 (CONF-911107–50) **Buried waste remote survey of the Idaho National Engineering Laboratory subsurface disposal area.** Richardson, B.S. (Oak Ridge National Lab., TN (United States)); Noakes, M.W.; Griebenow, B.E.; Josten, N.E. Oak Ridge National Lab., TN (United States). [1991]. 9p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society (ANS); San Francisco, CA (United States); 10-15 Nov 1991. Order Number DE92004347. Source: OSTI; NTIS; INIS; GPO Dep.

Burial site characterization is an important first step in the restoration of subsurface disposal sites. Testing and demonstration of technology for remote buried waste site characterization were performed at the Idaho National Engineering Laboratory (INEL) by a team from five US Department of Energy (DOE) laboratories. The US Army's Soldier Robot Interface Project (SRIP) vehicle, on loan to the Oak Ridge National Laboratory (ORNL), was used as a remotely operated sensor platform. The SRIP was equipped with an array of sensors including terrain conductivity meter, magnetometer, ground-penetrating radar (GPR), organic vapor detector, gamma-based radar detector, and spectrum analyzer. The testing and demonstration were successfully completed and provided direction for future work in buried waste site characterization.

6372 (CONF-911268–1) **Approach to improved safety of high-level radioactive waste storage by the US Department of Energy.** Tseng, J.C. (USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States)); Wiffen, D.M.; Daniels, R.S. USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). [1991]. 18p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. From CERS '91: Chinese experts radwaste symposium; Taipei (China); 17-18 Dec 1991. Order Number DE92003026. Source: OSTI; NTIS; INIS; GPO Dep.

In mid-1990 two unreviewed safety questions were identified associated with high-level radioactive wastes (HLW) storage at the US Department of Energy (DOE) Hanford Site located near Richland, Washington. Admiral Watkins, the Secretary of Energy, and Leo Duffy, the Acting Assistant Secretary for Environmental Restoration and Waste Management (EM), immediately initiated an aggressive program to resolve these two unreviewed safety questions and to improve the overall safety posture of HLW storage. This paper will first describe the DOE's approach to improve the safety of HLW storage, and then discuss DOE's program to resolve the high-priority safety issues at the Hanford Site. 3 refs.

6373 (CONF-920307–1) **Performance assessment of low-level radioactive waste disposal at Oak Ridge National Laboratory.** Lee, D.W.; Kocher, D.C. Oak Ridge National Lab., TN (United States). [1991]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Waste management '92; Tucson, AZ (United States); 1-5 Mar 1992. Order Number DE91018172. Source: OSTI; NTIS; INIS; GPO Dep.

A draft performance assessment (PA) for continuing and future low-level radioactive waste disposal at Oak Ridge National Laboratory (ORNL) has been prepared in response to the requirements in Chapter 3 of DOE Order 5820.2A. This paper presents an overview of the draft PA and discusses the major technical and policy issues that will be addressed in preparing the final PA. The draft PA considered five different disposal technologies located at a site that has been used for low-level waste disposal since 1969. Site-specific-analyses were performed for each type of disposal unit. These included detailed consideration of (1) the waste characteristics, (2) potential releases of radionuclides from disposal units as a result of infiltrating precipitation, (3) transport of radionuclides in shallow subsurface water, groundwater, and surface water, and (4) inadvertent intrusion following loss of active institutional control.

6374 (CONF-9111105–2) **Recycling and resource recovery at Oak Ridge National Laboratory.** Hall, R.; Benson, C.E.; Grubb, R.G.; Patton, B.D. Oak Ridge National Lab., TN (United States). [1991]. 10p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC05-84OR21400. From Carribean Haztech conference; San Juan (Puerto Rico); 13-15 Nov 1991. Order Number DE92003567. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses recycling and resource recovery strategies being developed to maintain continued operations at the Oak Ridge National Laboratory (ORNL). Several industrial decontamination techniques for minimization, segregation, and recycling of wastes volumes are presented. A wide variety of liquid wastewater streams are generated from the operations of these research facilities. The major chemical constituents – bicarbonates of calcium, magnesium, and sodium – are introduced by local river water and shallow drainage wells. Liquid low-level waste (LLLW), generated in support of DOE's nuclear energy technology programs over the past 40 years, are highly contaminated with fission products and transuranic (TRU) elements. These wastes are routinely collected in centralized collection tanks, concentrated by evaporation, and stored for future processing and disposal. The Resource Conservation and Recovery Act (RCRA) of 1976 mandated a nationwide system for the safe management of wastes that have been determined hazardous from their creation of their ultimate disposal (i.e., cradle-to-grave control). The Hazardous and Solid Waste Amendments of 1984 (HWSA) prohibited the continued placement of RCRA regulated hazardous wastes in or on the land without following Environmental Protection Agency (EPA) treatment standards. The EPA promulgated RCRA-LDR (land-disposal-restricted) regulations, minimizing short- and long-term threats arising from land disposal, will not allow facilities to store mixed LLLW after 1994 (56 FR 42730, August 29, 1991). Tank storage volume capacities are approaching maximum limits while treatment facilities to process and dispose these type wastes have been delayed indefinitely. As a result, these regulations and additional challenges have increased emphasis on recycling and resource recovery. 4 refs., 3 figs., 1 tab.

6375 (DOE/EA–0540) **Pond waste management project at the Oak Ridge, K-25 Site, Oak Ridge, Tennessee: Environmental assessment.** USDOE, Washington, DC (United States). Sep 1991. 41p. Sponsored by U.S. DOE Environment Safety & Health. Order Number DE92003906. Source: OSTI; NTIS; GPO Dep.

This report discusses the management of wastes associated with the ponds at the Oak Ridge K-25 Site. The background, proposed action, and environmental consequences of the proposed action are discussed. (JL)

6376 (DOE/ER/12812–T1) **Advanced depletion perturbation methods and waste transmutation in the IFR: Final report.** Downar, T.J. Purdue Univ., Lafayette, IN (United States). School of Nuclear Engineering. Dec 1991. 47p. Sponsored by U.S. DOE Energy Research. DOE Contract FG07-88ER12812. Order Number DE92004435. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the design of an LMR for burning minor actinides and development of advanced depletion perturbation methods. (LSP).

6377 (DOE-HMIP-RR–91.034) **Review of radioactive discharges from nuclear power stations.** Department of the Environment, London (United Kingdom). Her Majesty's Inspectorate of Pollution; Atkins (W.S.) Engineering Sciences Ltd., Warrington (United Kingdom). Feb 1991. 102p. Contract PECD-7/9/465. Order Number DE92615146. Source: OSTI; NTIS (US Sales Only); INIS.

HM Inspectorate of Pollution commissioned, with authorising responsibilities in England and Wales, a study into the discharges of radioactive effluents from Nuclear Power Stations. The study considered arisings from nuclear power stations in Europe and the USA and the technologies to treat and control the radioactive discharges. This report is a review of the arisings and concludes that suitable technologies exist, which if applied, could reduce discharges from nuclear power plants in England and Wales in line with the rest of Europe. (author).

6378 (DOE/RL/12253–T3) **Deflagration studies on waste Tank 101-SY: Test plan: Phase 1, Laboratory flammability studies of mixtures of hydrogen, nitrous oxide, and air: Revised.** Cashdollar, K.L.; Zlochower, I.A.; Hertzberg, M. Bureau of Mines, Pittsburgh, PA (United States). Pittsburgh Research Center. Jul 1991. 56p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AI06-91RL12253. Order Number DE92003489. Source: OSTI; NTIS; GPO Dep.

Waste slurries produced during the recovery of plutonium and uranium from irradiated fuel are stored in underground storage tanks. While a variety of waste types have been generated, of particular concern are the wastes stored in Tank 101-SY. A slurry growth-gas evolution cycle has been observed since 1981. The waste consists of a thick slurry, consisting of a solution high in NaOH, $NaNO_3$, $NaAlO_2$, dissolved organic complexants (EDTA, HEDTA, NTA, and degradation products), other salts (sulfates and phosphates), and radionuclides (primarily cesium and strontium). During a gas release the major gaseous species identified include: hydrogen and nitrous oxide (N_2O). Significant amounts of nitrogen may also be present. Traces of ammonia, carbon oxides, and other nitrogen oxides are also detected. Air and water vapor are also present in the tank vapor space. The purpose of the deflagration study is to determine risks of the hydrogen, nitrous oxide, nitrogen, and oxygen system. To be determined are pressure and temperature as a function of composition of reacting gases and the concentration of gases before and after the combustion event. Analyses of gases after the combustion event will be restricted to those tests that had an initial concentration of $\leq$8% hydrogen. This information will be used to evaluate safety issues related to periodic slurry growth and flammable gas releases from Tank 101-SY. the conditions to be evaluated will simulate gases in the vapor space above the salt cake as well as gases that potentially are trapped in pockets within/under the waste. The deflagration study will relate experimental laboratory results to conditions in the existing tanks.

6379 (DOE/RW–0307P-4) **Site characterization progress report: Yucca Mountain, Nevada, October 1, 1990–March 31, 1991: Number 4.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). Oct 1991. 158p. Sponsored by U.S. DOE Radioactive Waste Management. Source: OSTI (Free of Charge); INIS.

In accordance with the requirements of Section 113 (b) (3) of the Nuclear Waste Policy Act of 1982, as amended (NWPA), the US Department of Energy (DOE) has prepared this report on the progress of site characterization activities at Yucca Mountain, Nevada, for the period October 1, 1990, through March 31, 1991. This report is the fourth in a series of reports that are issued at intervals of approximately six months during site characterization. The report covers a number of initiatives to improve the effectiveness of the site characterization program, and covers continued efforts related to preparatory activities, Study Plans, and performance assessment.

6380 (ECN-C–90-057) **Progress report of the ECN contribution to the experiments in the HAW project: 2nd quarter 1990.** Duijves, K.A.; Vonka, V. Netherlands Energy Research Foundation, Petten (Netherlands). Dec 1990. 17p. Contract no. F1-1W-0003-D(B). Order Number DE92613946. Source: OSTI; NTIS (US Sales Only); INIS.

This work has been performed within the framework of the Commission of the European Communities Research and Development Programme on Management and Storage of Radioactive Waste.

This progress report documents the progress of the ECN contribution in the High Active Waste experiment, a large-scale in situ test being performed underground at the Asse salt mine in Remlingen FRG, during the period April 1st through June 30th, 1990. In ch. 2 a general overview is given of the experiment development. Problems and solutions are discussed in ch. 3. (author). 4 refs.; 10 figs.

6381 (ECN-C–90-063) **Progress report of the 600 m borehole project of the CEC programme on radioactive waste management and disposal: January-July 1990.** Hamilton, L.F.M.; Jockwer, N. Netherlands Energy Research Foundation, Petten (Netherlands). Dec 1990. 24p. Contract no. FI1W/0084. Order Number DE92613948. Source: OSTI; NTIS (US Sales Only); INIS.

This work has been performed within the framework of the Commission of the European Communities Research Programme on Radioactive Waste Disposal, CEC Directorate General for Research.

In the framework of the CEC Programme on Radioactive Waste Disposal (1985-1900), in situ experiments in salt deposits are conducted. The experimental results will be used to validate analytical techniques and computer models for the prediction of salt behaviour. The experiments planned in boreholes of 600 m depth take place in the Asse II salt mine in Germany. The progress of the work during the first half of 1990 is reported. For the drilling of the boreholes a new technique has been developed. The drillings resulted in two boreholes of approximately 300 m. In one of these boreholes drilling will not continue and convergence measurements have started. The convergence measurement devices are installed in one of the holes and are successfully in operation since February 1990. Convergence data will be reported in a date report. A 2nd experiment is prepared for which the variable pressure device has been constructed. This device will be placed at the end of

1990 in the Asse salt mine after the necessary tests have been performed. A measuring program of 2 Years will be carried out during the second phase of the 600 m borehole project 1991-1992. The convergence measurement devices will be temporarily stored until a 600 m deep borehole will have been drilled at the end of 1991. (author). 7 refs.; 8 figs.

6382 (ECN-C–91-003) **Progress report of the ECN contribution to the experiments in the HAW project: 2nd half year 1990.** Duijves, K.A.; Vonka, V. Netherlands Energy Research Foundation, Petten (Netherlands). Feb 1991. 16p. Contract no. F12W-0002-C(MB). Order Number DE92613949. Source: OSTI; NTIS (US Sales Only); INIS.

This work has been performed within the framework of the Commission of the European Communities Research and Development Programme on Management and Storage of Radioactive Waste.

This progress report documents the progress of the ECN contribution in the High Active Waste experiment, a large-scale in situ test being performed underground at the Asse salt mine in Remlingen FRG, during the period July 1st through December 31st, 1990. In ch. 2 a general overview is given of the experiment development. Problems and solutions are discussed in ch. 3. (author). 3 refs.; 10 figs.

6383 (ECN-RX–91-017) **An improved model for the convergence of an excavation on rock salt: Paper to be presented at the International conference on structural mechanics in reactor technology (paper L19/5), Tokyo, Japan, August 18-23, 1991.** Prij, J. Netherlands Energy Research Foundation, Petten (Netherlands). Feb 1991. 8p. (CONF-910817–: 11. international conference on structural mechanics in reactor technology, Tokyo (Japan), 18-23 Aug 1991). Order Number DE92613952. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted for publication.

Disposal of radioactive waste in salt formations requires excavations to be made in these geological formations. When time goes by the volume of these excavations will gradually decrease. This time dependent volume change is called the convergence of the excavation and is a result of both rock salt pressure and time dependent material behaviour and consequently depends strongly on depth and temperature. Convergence is an important process through which, with the lapse of time, any leakage of ground water into the repository can be excluded. On the other hand the same convergence ensures the contaminated brine to be extruded from a mine once flooded. An accurate safety analysis therefore requires an accurate model of convergence. In the computer code ENOS, used for the nuclide transport analyses, a special model for the convergence has been incorporated, based on experiments performed in the Asse. This model is based on a reference convergence rate K_{ref} and includes multiplication factors to account for the effect of brine pressure in the borehole, changes in rock temperature and resistance of this backfill. K_{ref} is the free volumetric convergence rate of an open borehole at reference rock pressure and temperature and is assumed to be constant. In this paper it is shown that the free convergence is not a constant. An improved convergence model is proposed which accounts for a transient free convergence. The accuracy of this model is tested with finite element analysis. (author). 6 refs.; 2 figs.

6384 (EGG-WTD–9776-Rev.1) **Pad A Treatability Study long-range project plan: Revision 1.** Mousseau, J.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1991. 98p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC07-76ID01570. Order Number DE92003336. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Pad A Treatability Study Project is to identify and demonstrate through lab- and pilot-scale testing, technologies for treating plutonium-contaminated salt waste. This document presents proposed objectives and schedules, scope of work and breakdown structure, cost elements, deployment, benefits, and change controls for the project.

6385 (HW–55176-Pt.3) **Index of CPD crib building numbers, designs of CPD radioactive liquid waste, disposal sites: Part 3 of 7 parts, Process technology–study report.** Wood, V.W. Hanford Works, Richland, WA (United States). 21 Apr 1958. 35p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE91018783. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this report (Part 3) is to provide a ready reference to the Redox Plant liquid waste disposal sites at the Hanford Reservation as well as a compilation of sketches showing the basic information on the design of each facility. Another objective is to establish a simplified and uniform numbering system. Still another objective is to provide an up-to-date tabulation. Subsequent parts of this report will provide information on cribs for such plants as "B" and "T" Plant. 4 refs.

6386 (IAEA-TECDOC–629) **Radioactive waste management profiles: Compilation of data from the Waste Management Data Base (WMDB).** International Atomic Energy Agency, Vienna (Austria). Oct 1991. 350p. Order Number DE92615145. Source: OSTI; NTIS (US Sales Only); INIS.

In 1989, the International Atomic Energy Agency began development of the Waste Management Data Base (WMDB) to, primarily, establish a mechanism for the collection, integration, storage, and retrieval of information relevant to radioactive waste management in Member States. This report is a summary and compilation of the information contained in the data base. The WMDB contains information and data on several aspects of waste management and offer a ready source of information on such activities as R and D efforts, waste disposal plans and programmes, important programme milestones, waste volume projections, and national and regulatory policies. This report is divided into two parts. Part one describes the Waste Management Data Base system and the type of information it contains. The second part contains data provided by Member States between August 1989 and December 1990 in response to a questionnaire sent by the Agency. However, if a Member State did not respond to the questionnaire, data from IAEA sources, such as technical assistance mission reports, were used - where such data exist. The WMDB system became operational in January 1991. The type of information contained in the data base includes radioactive waste management plans, policies and activities in Member States.

6387 (INIS-BR–2852) **Recovery of valuable products from the raffinate of uranium and thorium pilot-plant.** Martins, E.A.J. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). 1990 125p. (In Portuguese). Order Number DE92613934. Source: OSTI; NTIS (US Sales Only); INIS.

IPEN-CNEN/SP has being very active in refining yellow cake to pure ammonium diuranate which is converted to uranium trioxide, uranium dioxide, uranium tetra-and hexa-fluoride in sequential way. The technology of the thorium purification and its conversion to nuclear grade products has been a practice since several years as well. For both elements the major waste to be worked is the raffinate from purification via TBP-varsol in pulsed columns. In this paper the actual processing technology is reviewed with special emphasis on the recovery of valuable products, mainly nitric acid, ammonium nitrate, uranium, thorium and rare earth elements. Ammonium nitrate from the precipitation of uranium diuranate is of good quality, being radioactivity and uranium-free, and recommended to be applied as fertilizer. In conclusion the main effort is to maximize the recycle and reuse of the above mentioned chemicals. (author).

6388 (INIS-BR–2866) **Concrete conditioners for low-intermediate level nuclear wastes.** Roehl, J.L. (Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil)); Lorentz, R.G.; Franzen, H. Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). [1991] 10p. Order Number DE92613956. Source: OSTI; NTIS (US Sales Only); INIS.

An effort is made to provide the disposal conditioning of low-intermediate level wastes in Brazil with concrete packages designed in such a way that, in spite of being destined to receive compacted materials in long term sub-surface disposal, they may also be able to attend other storage or disposal necessities. In this way, one develops the design of a reinforced concrete package with a net volume and interior diameter adequate to the containment of pressed 200l drums. It is believed that pressing of commercial drums is an important point for simplification and cost reduction of the overall procedure. To provide flexibility in the use of these reinforced concrete packages even in marine disposal conditions, the construction specifications follow severe prescriptions to reduce corrosion and leakage. In sequence, a study is made on the comparison of 200 l steel packages. One adapts a 25 MN capacity press for this purpose and one executes two series of tests to verify the reliable volume reduction and the final dimensions and density of the compacted elements. Conclusions are reached toward a final configuration to the reinforced concrete package and the most convenient conditions for pressing. (author).

6389 (INIS-mf-13025 vp.) **Management of radioactive wastes generated during plutonium separation and handling operations (Preprint no. IT-21).** Kumra, M.S. (Bhabha Atomic Research Centre, bombay (India). Waste Management Div.). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. Feb 1991. 685p. (CONF-9102132–: International symposium on radiochemistry and radiation chemistry - plutonium 50, Bombay (India), 4-7 Feb 1991). In *International symposium on radiochemistry and radiation chemistry (Plutonium - 50 years) (held at Bombay during February 4-7, 1991): Preprints volume.* Order Number DE92001334. Source: OSTI; NTIS (US Sales Only); INIS.

The Indian nuclear power programme, envisaged from the beginning, adopted a closed nuclear fuel cycle. This involves separation of plutonium from the spent fuel and recycling the same for nuclear power production.The recovery of plutonium from spent fuel, which is being done successfully for the past many years, along with other associated activities of fuel fabrication and relevant R and D programmes generate radioactive wastes which need to be managed in a technoeconomical and safe manner. These wastes characterised by the decay heat generation and long half lives of the radionuclides present, account for more than 99% of the radioactivity in the entire nuclear fuel cycle. Though the wastes are produced in all the three physical states, major portion appears in the liquid streams. The strategy adopted in India and status of technology development in the management of these wastes are presented in this paper. (author). 6 refs.

6390 (Juel–2450) **Transparent and conservative models to calculate the safety of radioactive waste repositories.** Memmert, G. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemische Technologie. Feb 1991. 71p. (In German). Order Number DE92750128. Source: OSTI; NTIS (US Sales Only); INIS.

Based on new experimental results, the complicated calculation procedures to analyse the safety of repositories are rigorously simplified. These conservative calculations are sure to lead to an overestimation of radiation exposure after water ingress (flooding), but they show that the determined values are below the limit values recommended by the SSK and ICRP. For numerous fission and corrosion products as well as actinides, the concentrations for their release into the biosphere are given in tabular form - always compared with Pagis tables. The highest radiation exposures calculated by this simplified method are: (1) flooding of the Gorleben repository for LAW and MAW - 0.029 mSv/a (2.9 m rem/a) for I-129; (2) flooding of the Gorleben repository for HAW - 0.013 mSv/a (1.3 m rem/a) for Tc-99; (3) flooding of the Konrad repository - 0.011 mSv/a (1.1 m rem/a) for Ra-226. (HP).

6391 (Juel-Spez–558) **MAW and HTR-FE experimental disposal in boreholes. Study of radiation, corrosion resistance and long-term performance of instruments and electrical components under simulated in situ conditions in salt.** Niephaus, D.; Kreutz, F. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemische Technologie der Nuklearen Entsorgung. Mar 1990. 38p. (In German). Order Number DE92750131. Source: OSTI; NTIS (US Sales Only); INIS.

The radiation experiment under simulated in situ conditions in salt has shown after about 2 years' duration that the instruments considered safety relevant (rotary potentiometer, temperature sensor) and the measuring cable for use with them (Type KKWM) will certainly withstand the maximum estimated radiation dose of approx. 1.3×10^6 Gy (1.3×10^8 rad). The dose of 6×10^6 Gy (6×10^8 rad) (sensor) or 3×10^6 Gy (3×10^8 rad) (cable) was higher by a factor of 2, and yet no failure of the components was observed. The metal jacketed heating cable used to heat the boreholes and the Type ERR power supply cable are also certainly sufficiently radiation-resistant to maintain in temperature appropriate for a final repository throughout the five years of the experiment, which is the aim of the experiment. (orig.).

6392 (KAERI-II/RR–1/90) **Evaluation of structural behavior, geological and hydrogeological characteristics: Joint roughness characteristics and shear strength.** Kim, Jhin Wung (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Rhee, Chan Goo; Hwang, Shin Il. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1991. 124p. (In Korean). Order Number DE92615158. Source: OSTI; NTIS (US Sales Only); INIS.

This study suggests a quantitative evaluation method of joint roughness coefficient (JRC). It was accomplished by using several statistical parameters to the 10 standard profiles. The results show that some of these parameters (Root mean square gradient, Structure function, and Fractal dimension) are suitable to represent the roughness characteristics. With these selected parameters, further studys have succeeded to examine the variance upon scale effect. The result shows that the fractal dimension is the most correlated parameter of all to JRC. The modified empirical equation of shear strength by introducing fractal dimension to determine JRC was suggested. To prove its validity and to examine the applicable limit of the estimated strength by this equation, the values were compared to those obtained in laboratory works. The results show that the quantification procedure for JRC permits more reliable results when the scale effect is considered. The equation which relates normal stress to shear strength of natural joints developed in gneissic rocks is also suggested. This provides inexpensive method to evaluate rock mass porperty and it can be applied to usual engineering practice. (Author).

6393 (KAERI-II/RR–15/90) **The development of radioactive waste treatment technology (III): A study on the hot off-gas treatment process.** Kim, Joon Hyung (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Yim, Sung Paal; Kim, Jeong Guk; Ahn, Byung Gil; Won, Dong Yeon; Lee, Jae Chun. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Apr 1991. 296p. (In Korean). Order Number DE92615147. Source: OSTI; NTIS (US Sales Only); INIS.

The filtration test of commercial ceramic filters was performed to obtain the basic data relating to filter manufacture development of the advanced ceramic filter and proper usage of the ceramic filter. This experiment includes pressure drop test of clean filter performance test of filter according to dust loading, observation of reverse pulsing effects and filtration cycle effects for four different kinds of commercial ceramic filters. As a result, filtration performance of the composite type filter which has a thin fiber layer on the filter surface was more excellent than that of granular bed filter. And the results could be explained by related theory. Also for the development of SiC high temperature filter media, the properties such as porosity and bulk density were measured after manufacturing the cylindrical type filter according to the grain size of silicon carbide powder, the composition of refractory binder, and the forming pressure. As the grain size of silicon carbide powder increased, porosity of filter element decreased, meanwhile, bulk density of the element increased. Composition of refractory binder did not affect the bulk density and porosity of filter element. And as the forming pressure increased, porosity of the sample decreased. In addition, stabilization of ashes has been studied. The basic physical characteristics of ashes was investigated and ashes were solidified into stable forms. A high temperature sintering method was tried to solidify the ashes. The physical characteristics of the solidified form of ashes were also observed. As a result of sintering of ashes, the ashes were changed into ceramics and the ceramic products yielded relative density around 90%, porosity up to 10%, and compressed strength in the range of from 50 to 200 MPa. (Author).

6394 (KAERI-II/RR–16/90) **The development of radioactive waste treatment technology (III): The development of solidification technology.** Kim, Hwan Young (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Ki Hong; Kang, Mun Ja; Kim, Joon Hyung. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Mar 1991. 89p. (In Korean). Order Number DE92615148. Source: OSTI; NTIS (US Sales Only); INIS.

A treatment technology to get high volume reduction is subjected to be developed for increasing a disposal capacity. A technology of drying borate waste combined with plastic solidification is found to be one of advanced methods obtaining such volume reduction. The lab-scale experiment to develop a process was already carried out, and a pilot-scale equipment was constructed. Therefore, the optimum opration condition of such process has to be obtained. In order to search the method of reduction of drying time, the properties of dried products with different water content and the supernatant were tested. Unsaturated polyester was diluted with styrene for restraining a viscosity increment in the operation of the solidification process. And the viscosity of the mixture of solidifying media with dried products and properties of their wastes forms were tested. The factors effecting the oxidative degradation of ion-exchange resin and the process factors through the foreign data were analyzed. A fundamental experiment was carried out by changing the volume of hydrogen peroxide under the desired concentration of Fe^{2+} and spent ion-exchange resins. (Author).

6395 (KAERI/RR–945/90) **Microbial treatment of aqueous wastes.** Lee, Kang Suk (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chun, Ki Jung; Kim, Kug Chan; Choi, Yong Ho; Kim, In Gyu; Park, Hyo Kook; Kim, Jin Kyu. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 49p. (In Korean). Order Number DE92615149. Source: OSTI; NTIS (US Sales Only); INIS.

Aqueous waste effluents from nuclear fuel processing operations may contain trace quantities of heavy metals such as uranium. Conventional treatment of waste waters may be ineffective or expensive when uranium concentrations in the waste water must be reduced down to I μg/ml or less. The ability of some microorganisms to uptake or adsorb dissolved heavy metals offers a promising alternative method for waste treatment. The adsorption of uranium by Rhodobacter capsulata DSM 1710 and by Rhodospirillum rubrum DSM 467, two strains of photosynthetic bacteria, was examined to identify factors that might affect processes for the removal of uranium from aqueous solution. The optimal pH of uranium biosorption was 4.5 for both strains. Temperature had little or no effect on the process since more than 95 % of dissolved uranium was adsorbed to the bacterial biomass within 10 minutes after mixing of cell biomass at 25, 30, and 40 deg C, in case of Rb. capsulata. On the other hand the uranium adsorption by Rs. rubrum was affected by temperature showing much higher activity at 40 deg C than at 25 deg C. The maximum capacity of uranium adsorption by Rb. capsulata and Rs. rubrum was 248 and 228 μg U/mg-dry biomass, respectively. Such values are the highest among the reported so far in relation to microbial biosorptive removal of uranium. Furthermore the used cells could be regenerated as reusable sorbents for several times by washing the cell-bearing uranium with sodium bicarbonate solution. In conclusion, this kind of treatment of aqueous wastes can provided a promising alternative to existing methods in that the results of our study can be applied properly to the decontamination or recovery of certain pollutants and/or valuable elements from aqueous wastes. (Author).

6396 (KEK–90-25(v.1), pp. 210-217) **The intense proton accelerator program at JAERI.** Kaneko, Yoshihiko (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

The Intense Proton Accelerator Program is a proposal to build big linear accelerator of 1.5 GeV - 10 mA class, named as 'The Engineering Test Accelerator'. The major purpose of the accelerator is to develop the technologies related to the incineration of radio-activities in the nuclear wastes from the spent fuels of nuclear power reactors. The scale of the accelerator is far large beyond those of the existing ones. Therefore, a smaller machine named as 'The Basic Technology Accelerator' will be constructed in order to bring up to technical potentials. The Intense Proton Accelerator Program is expected to widen the paths through which the nuclear energy is addressed to be clean and continually used in the future as done in the past. (author).

6397 (K/TCD–1004) **Grout-based waste forms for the solidification of anion-exchange resins: Final report.** Del Cul, G.D.; Morgan, I.L.; Bostick, W.D.; Osborne, P.E. Oak Ridge K-25 Site, TN (United States). Dec 1991. 29p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OT21400. Order Number DE92005098. Source: OSTI; NTIS; INIS; GPO Dep.

The solidification of spent ion exchange resins in a grout matrix as a means of disposing of spent organic resins produced in the nuclear fuel cycle has many advantages in terms of process simplicity and economy, but associated with the process is the potential for water/cement/resins to interact and degrade the integrity of the waste form solidified. Summarized in this document are the results of our previous investigation[1] along with new results on the encapsulation of beaded anion-exchange resins in grout formulations containing ground, granulated blast furnace slag; Type 1-2 (mixed) portland cement; and additives (clays, amorphous silica, silica fume, and fly ash). The results of the studies show that the cured waste forms tested have a low leach rate for nitrate ions from the resin, a very low leach rate for $^{99}T_c$, and acceptable durability. The results also suggest that a surrogate waste form prepared in vinyl ester styrene binder performs satisfactorily against the wetting/drying criterion, and it should offer additional insight into future work on the solidification of spent organic resins.

6398 (KURRI-TR–345, pp. 101-110) **Research on TRU annihilation treatment using accelerators.** Kanno, Ikuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). The transuranic elements such as Np, Am and Cm contained in the spent fuel in nuclear reactors have the long half life longer than several thousands years, and continue to emit alpha particles. The amount of transuranic elements produced in a commercial reactor of 1000 MWe in one year is shown. Also the change of toxicity of the nuclides contained in the spent fuel of commercial reactors is shown as the function of time. At present the method of solidifying high level radioactive wastes with glass and burying them in deep strata is the fundamental concept. However if the transuranic elements having long half life can be converted to the elements having short half life by some method, the burden of their final disposal can be lightened. Japan Atomic Energy Research Institute has carried out the research on the annihilation treatment of transuranic elements using a proton accelerator following the Omega Project of Science and Technology Agency. The research on the development of the proton accelerator used for annihilation treatment, the research on the nuclear and thermal examination of sub-critical system and the basic experiment on nuclear spallation are reported. (K.I.).

6399 (KURRI-TR–349) **Proceedings of the specialists' meeting on radioactive wastes management.** Higashi, Kunio (Kyoto Univ. (Japan). Faculty of Engineering); Shimoura, Kazukuni (eds.). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Apr 1991. 73p. (In Japanese). (CONF-9011260–: Specialists' meeting on radioactive wastes management, Kumatori (Japan), 13-14 Nov 1990). Order Number DE92751060. Source: OSTI; NTIS (US Sales Only); INIS.

The specialist research meeting on radioactive waste management was held in the Research Reactor Institute, Kyoto University, on November 13 and 14, 1990. This meeting has been held annually in the last several years. The meeting has taken up the topics related to both high and low level waste. This year, it was decided to place emphasis on low level waste and decommissioning waste. This report contains the proceedings of the research meeting. More than 70 persons from universities, government laboratories and private industries participated in the meeting and discussion. The lectures were given on the international trend of the disposal of low level radioactive waste, the performance evaluation test on natural barriers against the movement of radioactive nuclides in shallow underground, the environment parameters used for the calculation of dose equivalent, the construction of the high performance treatment system for fuel reprocessing waste, the present state and the technical development of nuclear facility decommissioning, and the investigation and evaluation of groundwater flow. The preparation of this proceedings was made possible by the cooperation of the authors and the assistance of Radioactive Waste Management Division of Research Reactor Institute. (K.I.).

6400 (LA–12121-MS) **Microwave fluidized-bed detoxification of hazardous waste.** Varma, R. Los Alamos National Lab., NM (United States). Nov 1991. 9p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract W-7405-ENG-36. Order Number DE92004645. Source: OSTI; NTIS; GPO Dep.

Our ongoing research and development (R&D) work focuses on demonstrating the technical feasibility of total detoxification of "C1HC" hazardous waste by using microwave energy. In addition, we investigated the capability of nahacolite for in-bed scavenging of HC1 and found it to be very effective. So far, detoxification of halocarbon vapor and liquid waste forms has been achieved. Microwave energy heats and activates the particulates of silicon carbide (SiC) and promotes chemical interactions, facilitating total detoxification of chlorinated hydrocarbons (TCEs) in an air-stream over SiC-fluidized beds under mild (<600°) conditions. The SiC promotes surface-enhanced reactions and also is a heating transfer medium. These microwave-assisted processes appear to be extremely energy efficient. The Los Alamos National Laboratory (LANL) team can demonstrate the microwave fluidized bed (MFB) technology for total detoxification of halocarbon waste streams. The technology is applicable for treatment of hazardous waste at DOE sites. 5 refs., 5 figs.

6401 (LA–12216-MS) **Design and operational parameters of transportable supercritical water oxidation waste destruction unit.** McFarland, R.D.; Brewer, G.R.; Rofer, C.K. Los Alamos National Lab., NM (United States). Dec 1991. 27p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract W-7405-ENG-36. Order Number DE92004341. Source: OSTI; NTIS; INIS; GPO Dep.

Supercritical water oxidation (SCWO) is the destruction of hazardous waste by oxidation in the presence of water at temperatures and pressures above its critical point. A 1 gal/h SCWO waste destruction unit (WDU) has been designed, built, and operated at Los Alamos National Laboratory. This unit is transportable and is intended to demonstrate the SCWO technology on wastes at Department of Energy sites. This report describes the design of the WDU and the preliminary testing phase leading to demonstration.

6402 (LA-UR–91-4035) **Natural gels in the Yucca Mountain Area, Nevada, USA.** Levy, S.S. Los Alamos National Lab., NM (United States). [1991]. 12p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-36. (CONF-911109–5: Fall meeting of the European Materials Research Society, Strasbourg (France), 5-8 Nov 1991). Order Number DE92005058. Source: OSTI; NTIS; INIS; GPO Dep.

Relict gels at Yucca Mountain include pore- and fracture-fillings of silica and zeolite related to diagenetic and hydrothermal alternation of vitric tuffs. Water-rich free gels in fractures at Rainier Mesa consist of smectite with or without silica-rich gel fragments. Gels are being studied for their potential role in transport of radionuclides from a nuclear-waste repository.

6403 (MLM–3723(OP)) **Differences between the TERF and the ERS tritium capture systems.** Hedley, W.H.; Lamberger, P.H.; Colvin, C.M.; Gibbs, G.E.; Adams, F.S.; Bowser, R.P.; Kissner, T.J.; Morgan, F.E.; Schmidt, M.J.; Van Patten, J.F.; Wieneke, R.E. EG and G Mound Applied Technologies, Miamisburg, OH (United States). [1991]. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-910920–12: 4. topical meeting on tritium technology in fission, fusion, and isotopic applications, Albuquerque, NM (United States), 30 Sep - 4 oct 1991). Order Number DE92004005. Source: OSTI; NTIS; INIS; GPO Dep.

The TERF and the ERS tritium capture systems are alike in that they both use the "oxidize and dry" principle to remove tritium from gases, but they differ significantly in engineering details. The newer TERF system benefited in many ways from experience with the ERS. The TERF is expected to: (1) operate at a higher pressure, leading to greater throughput, (2) have redesigned reactors with better efficiency to process tritiated organic compounds, (3) have better energy conservation, (4) use an advanced process control system to provide more versatility in operation of the system, to account for the amount of tritium in the system at all times, and to more completely log operating results, (5) utilize more corrosion resistant materials to minimize maintenance, and (6) provide double containment of all pressurized tritium containing equipment to reduce tritium losses and increase operating safety. 6 refs.

6404 (MLM–3726(OP)) **Catalytic reactor system for the tritium emissions reduction facility.** Wieneke, R.E. EG and G Mound Applied Technologies, Miamisburg, OH (United States). [1991]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-910920–13: 4. topical meeting on tritium technology in fission, fusion, and isotopic applications, Albuquerque, NM (United States), 30 Sep - 4 oct 1991). Order Number DE92004006. Source: OSTI; NTIS; GPO Dep.

Two platinum catalyst reactor subsystems have been built for the new Tritium Emissions Reduction Facility (TERF) at Mound. The two parallel subsystems each consist of three major components: a passive conservation heat exchanger, an electric preheater, and a catalytic reactor. All subsystem components and interconnecting piping are fabricated from Inconel 625 for high temperature strength and corrosion resistance. System connections are welded for longevity and reliability. Active elements are backed up by installed spares, and the reactor catalyst is replaceable. Since double containment of tritium processing systems is an important safety concept, the entire subsystem is enclosed in a stainless steel glovebox. Careful planning during the design phase created thermal isolation from the glovebox, and the ability to translate the entire subsystem from the glovebox for major maintenance. 4 refs.

6405 (MLM–3727(OP)) **A probabilistic risk assessment of Mound's Tritium Emissions Reduction Facility (TERF).** Hedley, W.H. (EG and G Mound Applied Technologies, Miamisburg, OH (United States)); Adams, F.S.; Gibbs, G.E.; Ming, D.R.; Myers, K.J.; Wells, J.E. EG and G Mound Applied Technologies, Miamisburg, OH (United States). [1991]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-910920–11: 4. topical meeting on tritium technology in fission, fusion, and isotopic applications, Albuquerque, NM (United States), 30 Sep - 4 oct 1991). Order Number DE92004012. Source: OSTI; NTIS; INIS; GPO Dep.

A probabilistic risk assessment was made on the TERF process in order to establish its expected degree of reliability and to locate places in the system which could be improved by revision of the equipment or the operating procedures. The equipment design of the TERF was evaluated using a fault tree study. The probability of human failures was then evaluated by adding their probabilistic effects to the fault tree and then reevaluating it. It was found that (1) the TERF system is expected to be very reliable, with an annual expected downtime of only 2.35 hours, (2) the expected downtime comes almost entirely from process equipment failure rather than human errors, and (3) that certain equipment changes could be made that increased the system reliability. These equipment changes included: (1) making provision for blocking off certain automatic control values with more reliable manual valves to facilitate their repair and (2) making the two sources of power to the TERF totally independent of each other. 6 refs.

6406 (MLM–3728(OP)) **Moisture monitors for the Tritium Emissions Reduction Facility.** Hedley, W.H.; Gault, D.J.; Mielke, R.L. EG and G Mound Applied Technologies, Miamisburg, OH (United States). [1991]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-910920–10: 4. topical meeting on tritium technology in fission, fusion, and isotopic applications, Albuquerque, NM (United States), 30 Sep - 4 oct 1991). Order Number DE92004004. Source: OSTI; NTIS; GPO Dep.

Three types of moisture monitors: MCM Model Dewluxe-20, Panametrics Model System One, and Shaw Model SHA-TRS were tested for accuracy and speed of response over low (10–50 ppm H_2O), medium (100–500 ppm H_2O), and high (500–4000 ppm H_2O) concentration ranges. The results for the three instruments tested (one of each kind) showed that the MCM instrument was generally more accurate and responded more quickly than the other two instruments, with the Panametrics instrument being less accurate (except at low concentration) and slower to respond, and the Shaw instrument was the least accurate and least responsive of the three instruments during the tests made.

6407 (MLM–3729(OP)) **A distributed process control system for the Tritium Emissions Reduction Facility.** Kissner, T.J.; Wieneke, R.E. EG and G Mound Applied Technologies, Miamisburg, OH (United States). [1991]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-910920–14: 4. topical meeting on tritium technology in fission, fusion, and isotopic applications, Albuquerque, NM (United States), 30 Sep - 4 oct 1991). Order Number DE92004010. Source: OSTI; NTIS; INIS; GPO Dep.

The Tritium Emissions Reduction Facility (TERF) is an automated process that continuously removes tritium from process gases before they are discharged to the atmosphere. Key control parameters include: temperature, pressure, flow, oxygen content, total combustibles, moisture concentrations and tritium concentrations. The procurement of an industrial, microprocessor-based Distributed Process Control System was justified for TERF due to the critical nature and complexity of the system. A detailed performance specification was prepared and submitted to industrial companies who had demonstrated past success in the field of process control and instrumentation. The contract was awarded to the Foxboro Company, of Foxboro, Ma., who developed the new Intelligent Automation (I/A) Distributed Process Control System. A primary goal of the design team was that the control system increase TERF reliability and availability by automatically controlling system operation and by assisting the operator in the diagnosis of problems, preventative maintenance, alarming, report generation, and long term storage of data. The comprehensive continuous monitoring of the TERF process provided by the Foxboro I/A Distributed System is expected to: (1) optimize the system operating parameters and control the process better than was previously possible, (2) provide more alerts and alarms to aid operators in diagnosing and responding to problems, and (3) record and organize process data more effectively than before.

6408 (NKS–91-1) **The Nordic program for nuclear safety 1990-1993: Annual report 1990.** Nordisk Kontaktorgan for Atomenergispoergsmaal, Roskilde (Denmark). Feb 1991. 56p. (In Danish, Swedish, Norwegian Order Number DE92614970. Source: OSTI; NTIS (US Sales Only); INIS.

The status of ongoing projects under The Nordic Program for Nuclear Safety (NKS) 1990-1993, and the economy of the programme is presented. A review of projects, projects managers and coordinators, and a list of members of NKS and associated members is included. (CLS).

6409 (NUREG/CR–5352-Rev.1) **VAM2D: Variably saturated analysis model in two dimensions: Version 5.2 with hysteresis and chained decay transport: Documentation and user's guide: Revision 1.** Huyakorn, P.S. (HydroGeoLogic, Inc., Herndon, VA (United States)); Kool, J.B.; Wu, Y.S. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; HydroGeoLogic, Inc., Herndon, VA (United States). Oct 1991. 270p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This report documents a two-dimensional finite element model, VAM2D, developed to simulate water flow and solute transport in variably saturated porous media. Both flow and transport simulation can be handled concurrently or sequentially. The formulation of the governing equations and the numerical procedures used in the code are presented. The flow equation is approximated using the Galerkin finite element method. Nonlinear soil moisture characteristics and atmospheric boundary conditions (e.g., infiltration, evaporation and seepage face), are treated using Picard and Newton-Raphson iterations. Hysteresis effects and anisotropy in the unsaturated hydraulic conductivity can be taken into account if needed. The contaminant transport simulation can account for advection, hydrodynamic dispersion, linear equilibrium sorption, and first-order degradation. Transport of a single component or a multicomponent decay chain can be handled. The transport equation is approximated using an upstream weighted residual method. Several test problems are presented to verify the code and demonstrate its utility. These problems range from simple one-dimensional to complex two-dimensional and axisymmetric problems. This document has been produced as a user's manual. It contains detailed information on the code structure along with instructions for input data preparation and sample input and printed output for selected test problems. Also included are instructions for job set up and restarting procedures. 44 refs., 54 figs., 24 tabs.

6410 (NUREG/CR–5795) **Validation and testing of the VAM2D computer code.** Kool, J.B. (HydroGeoLogic, Inc., Herndon, VA (United States)); Wu, Y.S. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; HydroGeoLogic, Inc., Herndon, VA (United States). Oct 1991. 115p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This document describes two modeling studies conducted by HydroGeoLogic, Inc. for the US NRC under contract no. NRC-04089-090, entitled, "Validation and Testing of the VAM2D Computer Code." VAM2D is a two-dimensional, variably saturated flow and transport code, with applications for performance assessment of nuclear waste disposal. The computer code itself is documented in a separate NUREG document (NUREG/CR-5352, 1989). The studies presented in this report involve application of the VAM2D code to two diverse subsurface modeling problems. The first one involves modeling of infiltration and redistribution of water and solutes in an initially dry, heterogeneous field soil. This application involves detailed modeling over a relatively short, 9-month time period. The second problem pertains to the application of VAM2D to the modeling of a waste disposal facility in a fractured clay, over much larger space and time scales and with particular emphasis on the applicability and reliability of using equivalent porous medium approach for simulating flow and transport in fractured geologic media. Reflecting the separate and distinct nature of the two problems studied, this report is organized in two separate parts. 61 refs., 31 figs., 9 tabs.

6411 (ORNL/ER–36) **SWSA 6 interim corrective measures environmental monitoring: FY 1990 results: Environmental Restoration Program.** Ashwood, T.L.; Spalding, B.P. Oak Ridge National Lab., TN (United States). Jul 1991. 162p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. Order Number DE92003728. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication 3722.

This report presents the results and conclusions from a multifaceted monitoring effort associated with the high-density polyethylene caps installed in Solid Waste Storage Area (SWSA) 6 at Oak Ridge National Laboratory (ORNL) as an interim corrective measure (ICM). The caps were installed between November 1988 and June 1989 to meet Resource Conservation and Recovery Act (RCRA) requirements for closure of those areas of SWSA 6 that had received RCRA-regulated wastes after November 1980. Three separate activities were undertaken to evaluate the performance of the caps: (1) wells were installed in trenches to be covered by the caps, and water levels in these intratrench wells were monitored periodically; (2) samples were taken of the leachate in the intratrench wells and were analyzed for a broad range of radiological and chemical contaminants; and (3) water levels in wells outside the trenches were monitored periodically. With the exception of the trench leachate sampling, each of these activities spanned the preconstruction, construction, and postconstruction periods. Findings of this study have important implications for the ongoing remedial investigation in SWSA 6 and for the design of other ICMs. 51 figs., 2 tabs.

6412 (ORNL/M–1327) **Active Sites Environmental Monitoring Program: FY 1990 annual report.** Wickliff, D.S.; Morrissey, C.M.; Ashwood, T.L. Oak Ridge National Lab., TN (United States). Oct 1991. 53p. Sponsored by U.S. DOE Office of Environmental

Restoration and Waste Management. DOE Contract AC05-84OR21400. Order Number DE92004901. Source: OSTI; NTIS; INIS; GPO Dep.

Chapter 3 of US Department of Energy (DOE) Order 5820.2A (DOE 1988) sets forth requirements for environmental monitoring of active low-level waste (LLW) disposal sites. Active sites are defined as those LLW facilities that were in use on or after the date of the order (September 1988). The transuranic (TRU) waste storage areas in Solid Waste Storage Area (SWSA) 5 North are covered by Chap. 2 of the order. In both chapters, monitoring is required to provide for early warning of leaks before those leaks pose a threat to human health or the environment. Chapter 3 also requires that monitoring be conducted to evaluate the short- and long-term performance of LLW disposal facilities. In accordance with this order, the Solid Waste Operations Department at Oak Ridge National Laboratory (ORNL) has established an Active Sites Environmental Monitoring Program (ASEMP) that is implemented by staff of the Environmental Sciences Division (ESD) at ORNL. This report summarizes data from ASEMP monitoring activities for the final 6 months of FY 1990. A brief summary of the monitoring methodology for each site is presented also.

6413 (ORNL/M–1442) **Active Sites Environmental Monitoring Program: Mid-FY 1991 report.** Ashwood, T.L.; Wickliff, D.S.; Morrissey, C.M. Oak Ridge National Lab., TN (United States). Oct 1991. 68p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. Order Number DE92004903. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 3700.

This report summarizes the activities of the Active Sites Environmental Monitoring Program (ASEMP) from October 1990 through March 1991. The ASEMP was established in 1989 by Solid Waste Operations and the Environmental Sciences Division to provide early detection and performance monitoring at active low-level radioactive waste (LLW) disposal sites in Solid Waste Storage Area (SWSA) 6 and transuranic (TRU) waste storage sites in SWSA 5 as required by chapters II and III of US Department of Energy Order 5820.2A. Monitoring results continue to demonstrate the no LLW is being leached from the storage vaults on the tumulus pads. Loading of vaults on Tumulus II began during this reporting period and 115 vaults had been loaded by the end of March 1991.

6414 (ORNL/TM–11798) **Development studies for the treatment of ORNL low-level liquid waste.** Campbell, D.O.; Lee, D.D.; Dillow, T.A. Oak Ridge National Lab., TN (United States). Nov 1991. 47p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. Order Number DE92004597. Source: OSTI; NTIS; INIS; GPO Dep.

An experimental program is under way to investigate potential separation methods for application to specific problems relating to the management of low-level liquid wastes (LLLWs) at ORNL. This report summarizes experimental results that were acquired during fiscal year 1990 and have not been previously reported elsewhere. Measurements are presented for cesium and strontium removal from simulated high-salt waste compositions, using both inorganic ion- exchange sorbents and organic ion-exchange resins, and for one experiment with actual LLLW supernate solution from Melton Valley Storage Tank W-26, using inorganic sorbents. The purpose of the study was to acquire an extensive data base to support the development of flowsheets for decontamination of the LLLW currently stored at ORNL. Experimental measurements with inorganic ion exchangers focused on batch separations of cesium using several transition-metal hexacyanoferrate(2) compositions (ferrocyanides) and of strontium using titanium oxide-based sorbents. Cesium distribution coefficients in the range of 1×10^6 were generally observed with nickel and cobalt ferrocyanides at pH values ≤ 11, yielding DFs of about 100 with 100 ppm sorbent in a single-stage batch separation. Most organic ion-exchange resins are not very effective for cesium removal from such high salt concentrations, but a new resorcinol-based resin developed at the Savannah River Site was found to be considerably superior to any other such material tested. Several chelating resins were effective for removing strontium from the waste simulants. An ion-exchange column test successfully demonstrated the simultaneous removal of both cesium and strontium from a waste simulant solution.

6415 (ORNL/TM–11891) **Low-level liquid waste decontamination by ion exchange.** Campbell, D.O.; Lee, D.D.; Dillow, T.A. Oak Ridge National Lab., TN (United States). Dec 1991. 25p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. Order Number DE92004885. Source: OSTI; NTIS; INIS; GPO Dep.

Improved processes are being developed to treat contaminated liquid wastes that have been and continue to be generated at Oak Ridge National Laboratory. Both inorganic and organic ion-exchange methods have given promising results. Nickel and cobalt hexacyanoferrate(2) compounds are extremely selective for cesium removal, with distribution coefficients in excess of 10^6 and remarkable insensitivity to competition from sodium and potassium. They tend to lose effectiveness at pH $> \sim 11$, but some formulations are useful for limited periods of time up to pH ~ 13. Sodium titanate is selective for strontium removal at high pH. The separations are so efficient that simple batch processes can yield large decontamination factors while generating small volumes of solid waste. A resorcinol-based resin developed at the Savannah River Site gave superior cesium removal, compared with other organic ion exchangers; the distribution coefficient was limited primarily by competition from potassium and was nearly independent of sodium. The optimum pH was ~ 12.5. It was much less effective for strontium removal, which was limited by competition from sodium. 8 refs., 6 figs., 9 tabs.

6416 **Process for the recovery of strontium from acid solutions.** Horwitz, E.P.; Dietz, M.L. To Dept. of Energy. 1990. Filed date 9 Apr 1990. USA Patent patent application 7-506,125. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE92003841. Source: OSTI; NTIS; GPO Dep.

The invention is a process for selectively extracting strontium and technetium values from aqueous nitric acid waste solutions containing these and other fission product values. The extractant is a macrocyclic polyether in a diluent which is insoluble in water, but which will itself dissolve a small amount of water. The process will extract strontium and technetium values from nitric acid solutions which are up to 6 molar in nitric acid.

6417 (PNL–7822) **A summary of available information on ferrocyanide tank wastes: Hanford Tank Safety Project.** Burger, L.L. (Pacific Northwest Lab., Richland, WA (United States)); Strachan, D.M.; Reynolds, D.A.; Schulz, W.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 42p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract AC06-76RL01830. Order Number DE92002216. Source: OSTI; NTIS; INIS; GPO Dep.

Ferrocyanide wastes were generated at the Hanford site during the mid to late 1950s to make more tank space available for the storage of high level nuclear waste. The ferrocyanide process was developed as a method of removing ^{137}Cs from existing waste solutions and from process solutions that resulted from the recovery of valuable uranium in waste tanks. During the coarse of the research associated with the ferrocyanide process, it was discovered that ferrocyanide materials when mixed with $NaNO_3$ and/or $NaNO_2$ exploded. This chemical reactivity became an issue in the 1980s when the safety associated with the storage of ferrocyanide wastes in Hanford tanks became prominent. These safety issues heightened in the late 1980s and led to the current scrutiny of the safety associated with these wastes and the current research and waste management programs. Over the past three years, numerous explosive test have been carried out using milligram quantities of cyanide compounds. These tests provide information on the nature of possible tank reactions. On heating a mixture of ferrocyanide and nitrate or nitrite, an explosive reaction normally begins at about 240°C, but may occur well below 200°C in the presence of catalysts or organic compounds that may act as initiators. The energy released is highly dependent on the course of the reaction. Three attempts to model hot spots in local areas of the tanks indicate a very low probability of having a hot spot large enough and hot enough to be of concern. The main purpose of this document is to inform the members of the Tank Waste Science Panel of the background and issues associated with the ferrocyanide wastes. Hopefully, this document fulfills similar needs outside of the framework of the Tank Waste Science Panel. 50 refs., 9 figs., 7 tabs.

6418 (PNL–7857) **Assessment of end of life disposal, tritium recovery and purification strategies for radioluminescent lights.** Jensen, G.A. (Pacific Northwest Lab., Richland, WA (United States)); Hazelton, R.F.; Ellefson, R.E.; Carden, H.S. Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 44p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92003901. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this joint assessment by the Pacific Northwest Laboratory and EG&G Mound Applied Technologies is to identify and examine options for disposal of aged-out RL lights based on current technology, and for the possible recovery and purification of tritium from the lights and disposal of the resulting contaminated remnants. The focus of the assessment is on the waste disposal and tritium recycling issues that will evolve with use of advanced RL lighting technology and that are relevant to industrial suppliers and to civilian, military, and other government users. The scope of work also includes identification of the potential financial benefits and risks of recycle versus direct disposal. 5 refs., 8 figs., 13 tabs.

6419 (PNL-SA–19867) **Effects of an oxidizing atmosphere in a spent fuel packaging facility.** Einziger, R.E. Pacific Northwest Lab., Richland, WA (United States). Sep 1991. 36p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC06-76RL01830. (CONF-910945–2: Focus '91: nuclear waste packaging, Las Vegas, NV (United States), 29 Sep - 4 oct 1991). Order Number DE92002158. Source: OSTI; NTIS; INIS; GPO Dep.

Sufficient oxidation of spent fuel can cause a cladding breach to propagate, resulting in dispersion of fuel particulates and gaseous radionuclides. The literature for spent fuel oxidation in storage and disposal programs was reviewed to evaluate the effect of an oxidizing atmosphere in a preclosure packaging facility on (1) physical condition of the fuel and (2) operations in the facility. Effects such as cladding breach propagation, cladding oxidation, rod dilation, fuel dispersal, ^{14}C and ^{85}Kr release, and crud release were evaluated. The impact of these effects, due to oxidation, upon a spent fuel handling facility is generally predicted to be less than the impact of similar effects due to fuel rod breached during handling in an inert-atmosphere facility. Preliminary temperature limits of 240°C and 227°C for a 2-week or 4-week handling period and 175°C for 2-year lag storage would prevent breach propagation and fuel dispersal. Additional data that are needed to support the assumptions in this analysis or complete the database were identified.

6420 (PNL-SA–20045) **Conceptual adsorption models and open issues pertaining to performance assessment.** Serne, R.J. Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 49p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC06-76RL01830. (CONF-9110246–2: Nuclear energy agency sorption workshop '91, Interlaken, (Switzerland), 14-22 Oct 1991). Order Number DE92002741. Source: OSTI; NTIS; INIS; GPO Dep.

Recently several articles have been published that question the appropriateness of the distribution coefficient, Rd, concept to quantify radionuclide migration. Several distinct issues are raised by various critics. In this paper I provide some perspective on issues surrounding the modeling of nuclide retardation. The first section defines adsorption terminology and discusses various adsorption processes. The next section describes five commonly used adsorption conceptual models, specifically emphasizing what attributes that affect adsorption are explicitly accommodated in each model. I also review efforts to incorporate each adsorption model into performance assessment transport computer codes. The five adsorption conceptual models are (1) the constant Rd model, (2) the parametric Rd model, (3) isotherm adsorption models, (4) mass-action adsorption models, and (5) surface-complexation with electrostatics models. The final section discusses the adequacy of the distribution ratio concept, the adequacy of transport calculations that rely on constant retardation factors and the status of incorporating sophisticated adsorption models into transport codes.

6421 (RFP–4479) **Removal of actinides from Rocky Flats soil.** Kochen, R.L.; McGlochin, S.C.; Pettis, S.A. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 12 Sep 1991. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC34-90DP62349. Order Number DE92004800. Source: OSTI; NTIS; GPO Dep.

A study was performed to evaluate a gravimetric separator (mineral jig) in conjunction with wet sieving for removing actinide-containing clays from Rocky Flats soil. Both field-moist (3% moisture) and pre-dried (110°C) soils were wet sieved and mineral jigged. In addition, size separation (dry sieving), attrition scrubbing, and rotary scrubbing were evaluated for actinide removal in field-moist soil. Wet sieving removed >98% of the activity in both field-moist and pre-dried, <50- to 4.0-mm soil fractions. More than 99% of the activity was removed from soil that was first size separated (<50 to 4.0 mm) and then wet sieved. Actinide removal in the <4.0- to 2.4-mm and <2.4- to 0.42-mm soil fractions followed the sequence: attrition scrubbing > wet sieving > rotary scrubbing. Wet sieving removed about 20% more activity from field-moist, <4.0- to 2.4-mm soil fractions compared to similar, pre-dried soil fractions. The mineral jig removed actinide-containing clays from the <0.42-mm soil fractions. The americium was lowered from 100 to 11 pCi/g in 4 wt % of the soil (<0.42 to 0.250 mm). Sodium hydroxide solution (pH 12.5) was used in all of the wet soil decontamination procedures. The spent NaOH wash solutions were filtered (2.5 μm) and the total alpha activity in the filtered solutions was <1 pCi/mℓ.

6422 (SAND–87-2777) **Retrieval strategy report for a potential high-level nuclear waste repository: Yucca Mountain Site Characterizadtion Project.** Flores, R. Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 521p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE92005385. Source: OSTI; NTIS; INIS; GPO Dep.

In federal laws, regulations, and departmental directives, the US Congress, the Nuclear Regulatory Commission, and the US Department of Energy have developed criteria for retrievability of waste emplaced in a geologic repository for high-level radioactive waste. In response to these criteria, the Yucca Mountain Project has included in the design of the potential repository at Yucca Mountain the option to retrieve emplaced waste as a planned contingency operation. This report presents a Project strategy for maintaining retrievability. It includes descriptions of repository and equipment designs; the operations during waste emplacement, post-emplacement, and retrieval; and expected repository conditions (normal and abnormal). Retrieval-related regulations and requirements are presented and discussed as a basis for evaluating the designs and operations plans. The report concludes with discussions of retrieval strategy implementation, which includes determining which equipment and operations demonstrations are necessary or required and plans for future work. 78 figs., 34 tabs.

6423 (SAND–88-3164) **Calculation of experiment uncertainty in laboratory determination of several geoengineering properties of tuffs from Yucca Mountain, Nevada: Yucca Mountain Site Characterization Project.** Nimick, F.B.; Schwartz, B.M.; Price, R.H. Sandia National Labs., Albuquerque, NM (United States). Nov 1991. 39p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE92003612. Source: OSTI; NTIS; INIS; GPO Dep.

A method for estimating the precision and accuracy of measured parameters is described. Examples of application of the estimating method are presented for density, porosity, compressive strength, Young's modulus, Poisson's ratio, and thermal expansion. With the exception of the coefficient of linear thermal expansion, all laboratory data for these properties for tuff samples appear to have reasonable experiment uncertainties. Uncertainties in the thermal-expansion coefficients may be as high as 39% of the values, although most uncertainties for the coefficients are probably ≤2%. 4 refs., 1 fig., 15 tabs.

6424 (SAND–88-7065) **Documentation and verification of the SHAFT code: Yucca Mountain Site Characterization Project.** St.John, C.M. (Agapito (J.F.T.) and Associates, Inc., Grand Junction, CO (United States)). Sandia National Labs., Albuquerque, NM (United States); Agapito (J.F.T.) and Associates, Inc., Grand Junction, CO (United States). Dec 1991. 173p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE92004786. Source: OSTI; NTIS; INIS; GPO Dep.

The SHAFT code incorporates equations to compute stresses in a shaft liner when the rock through which a shaft passes is subject to known three-dimensional states of stress or strain. The deformation modes considered are hoop deformation, axial deformation, and shear on a plane normal to the shaft axis. Interaction between the liner and the soil and rock is considered, and it is assumed that the liner is in place before loading is applied. This code is intended to be used interactively but creates a permanent record complete with necessary quality assurance information. The code has been carefully verified for the case of generalized plane strain, in which an arbitrary axial strain can be defined. It may also be used for plane stress analysis. Output is given in the form of stresses at selected sample points in the linear and the rock and a simple graphical representation of the distribution of stress through the liner. 12 figs., 13 tabs.

6425 (SAND–89-0837) **Drift design methodology and preliminary application for the Yucca Mountain Site Characterization Project: Yucca Mountain Site Characterization Project.** Hardy, M.P. (Agapito (J.F.T.) and Associates, Inc., Grand Junction, CO (United States)); Bauer, S.J. Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 168p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE92004788. Source: OSTI; NTIS; INIS; GPO Dep.

Excavation stability in an underground nuclear waste repository is required during construction, emplacement, retrieval (if required), and closure phases to ensure worker health and safety, and to prevent development of potential pathways for radionuclide migration in the post-closure period. Stable excavations are developed by appropriate excavation procedures, design of the room shape, design and installation of rock support reinforcement systems, and implementation of appropriate monitoring and maintenance programs. In addition to the loads imposed by the in situ stress field, the repository drifts will be impacted by thermal loads developed after waste emplacement and, periodically, by seismic loads from naturally occurring earthquakes and underground nuclear events. A priori evaluation of stability is required for design of the ground support system, to confirm that the thermal loads are reasonable, and to support the license application process. In this report, a design methodology for assessing drift stability is presented. This is based on site conditions, together with empirical and analytical methods. Analytical numerical methods are emphasized at this time because empirical data are unavailable for excavations in welded tuff either at elevated temperatures or under seismic loads. The analytical methodology incorporates analysis of rock masses that are systematically jointed, randomly jointed, and sparsely jointed. In situ thermal and seismic loads are considered. Methods of evaluating the analytical results and estimating ground support requirements for all the full range of expected ground conditions are outlines. The results of a preliminary application of the methodology using the limited available data are presented. 26 figs., 55 tabs.

6426 (SAND–89-1989) **Areal power density: A preliminary examination of underground heat transfer in a potential Yucca Mountain repository and recommendations for thermal design approaches: Yucca Mountain Site Characterization Project.** Hertel, E.S. Jr.; Ryder, E.E. Sandia National Labs., Albuquerque, NM (United States). Nov 1991. 77p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE92004789. Source: OSTI; NTIS; INIS; GPO Dep.

The design of the potential Yucca Mountain repository is subject to many thermal goals related to the compliance of the site with federal regulations. This report summarizes a series of sensitivity studies that determined the expected temperatures near the potential repository. These sensitivity studies were used to establish an efficient loading scheme for the spent fuel canisters and a maximum areal power density based strictly on thermal goals. Given the current knowledge of the site, a design-basis areal power density of 80 kW/acre can be justified based on thermal goals only. Further analyses to investigate the impacts of this design-basis APD on mechanical and operational aspects of the potential repository must be undertaken before a final decision is made.

6427 (SAND–89-7023) **Documentation and verification of STRES3D, Version 4.0: Yucca Mountain Site Characterization Project.** Asgian, M.I. (Agapito (J.F.T.) and Associates, Inc., Grand Junction, CO (United States)); St. John, C.M.; Hardy, M.P.; Goodrich, R.R. Sandia National Labs., Albuquerque, NM (United States); Agapito (J.F.T.) and Associates, Inc., Grand Junction, CO (United States). Dec 1991. 235p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE92004785. Source: OSTI; NTIS; INIS; GPO Dep.

STRES3D is a thermomechanical analysis code for predicting transient temperatures, stresses and displacements in an infinite and semi-infinite, conducting, homogeneous, elastic medium. The heat generated at the sources can be constant or decay exponentially with time. Superposition is used to integrate the effect of heat sources distributed in space and time to simulate the thermomechanical effect of placement of heat generating nuclear waste canisters in an underground repository. Heat sources can be defined by point, lines or plates with numerical integration of the kernal point source solution used to develop the line and plate sources. STRES3D is programmed using FORTRAN77 and is suitable for use on micro or larger computer systems.

6428 (SAND–90-2261) **Research program to develop and validate conceptual models for flow and transport through unsaturated, fractured rock: Yucca Mountain Site Characterization Project.** Glass, R.J.; Tidwell, V.C. Sandia National Labs., Albuquerque, NM (United States). Sep 1991. 63p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE92004301. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Yucca Mountain Project, our research program to develop and validate conceptual models for flow and transport through unsaturated fractured rock integrates fundamental physical experimentation with conceptual model formulation and mathematical modeling. Our research is directed toward developing and validating macroscopic, continuum-based models and supporting effective property models because of their widespread utility within the context of this project. Success relative to the development and validation of effective property models is predicted on a firm understanding of the basic physics governing flow through fractured media, specifically in the areas of unsaturated flow and transport in a single fracture and fracture-matrix interaction.

6429 (SAND–90-2748) **18 W/m^2 Mockup for Defense High-Level Waste (Rooms A): In situ data report: Volume 1—Mechanical response gages (February 1985–June 1990): Waste Isolation Pilot Plant (WIPP) Thermal/Structural Interactions Program.** Munson, D.E. (Sandia National Labs., Albuquerque, NM (United States)); Petney, S.V.; Clancy, R.M.; Ball, J.R.; Jones, R.L.; Northrop-Salazar, C.L. Sandia National Labs., Albuquerque, NM (United States). Oct 1991. 623p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004790. Source: OSTI; NTIS; INIS; GPO Dep.

Data are presented from the 18 W/m^2 Mockup for Defense High-Level Waste, a very large scale in situ test fielded underground at the Waste Isolation Pilot Plant (WIPP). These data include selected fielding information, test configuration, instrumentation activities, and comprehensive results from a large number of gages. The results in this report give measured data from the mechanical response gages, i.e., room closure gages, extensometers, and stress meters emplaced in the test. Construction of the test began in June 1984; gage data in this report cover the complete test duration, that is, to June 1990.

6430 (SAND–91-0269) **Changes in rock salt permeability due to nearby excavation.** Stormont, J.C. (Sandia National Labs., Albuquerque, NM (United States)); Howard, C.L.; Daemen, J.J.K. Sandia National Labs., Albuquerque, NM (United States). Jul 1991. 17p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC04-76DP00789. (CONF-910728–8: 32. US symposium on rock mechanics, Norman, OK (United States), 10-12 Jul 1991). Order Number DE92003589. Source: OSTI; NTIS; GPO Dep.

Changes in brine and gas permeability of rock salt as a result of nearby excavation (mine-by) have been measured from the underground workings of the WIPP facility. Prior to the mine-by, the formation responds as a porous medium with a very low brine permeability, a significant pore (brine) pressure and no measurable gas permeability. The mine-by excavation creates a dilated, partially saturated zone in the immediate vicinity of the excavation with an increased permeability to brine and a measurable permeability to gas. The changes in hydrologic properties are discussed in the context of pore structure changes.

6431 (SAND–91-0893/1) **Preliminary comparison with 40 CFR Part 191, Subpart B for the Waste Isolation Pilot Plant, December 1991: Volume 1: Methodology and results.** Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 534p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92005044. Source: OSTI; NTIS; INIS; GPO Dep.

Before disposing of transuranic radioactive wastes at the Waste Isolation Pilot Plant (WIPP), the United States Department of Energy must have a reasonable expectation that the WIPP will comply with the quantitative requirements of Subpart B of the United States Environmental Protection Agency's (EPA) Standard, Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-Level and Transuranic Radioactive Wastes. Sandia National Laboratories, through iterative performance assessments of the WIPP disposal system, is conducting an evaluation of the long-term performance of the WIPP that includes analyses for the Containment Requirements and the Individual Protection Requirements of Subpart B of the Standard. Recognizing that unequivocal proof of compliance with the Standard is not possible because of the substantial uncertainties in predicting future human actions or natural events, the EPA expects compliance to be determined on the basis of specified quantitative analyses and informed, qualitative judgment. Performance assessments of the WIPP will provide as detailed and thorough a basis as practical for the quantitative aspects of that decision.

6432 (SAND–91-0893/2) **Preliminary comparison with 40 CFR Part 191, Subpart B for the Waste Isolation Pilot Plant: Volume 2: Probability and consequence modeling.** Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 388p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC04-76DP00789. Order Number DE92004914. Source: OSTI; NTIS; INIS; GPO Dep.

This second volume documents the probability and consequence modeling done by the Performance Assessment Division of Sandia National Laboratories for the 1991 preliminary performance assessment (PA) of the Waste Isolation Pilot Plant (WIPP). The volume provides an overview of the PA calculations; discusses the mechanics of the probability modeling and construction of the complementary cumulative distribution functions (CCDFs); discusses the generic computational models and the applied (or site-specific) models used in consequence analysis and the results that these models predict for both undisturbed conditions (base case) and disturbed conditions (in which one or more hypothetical boreholes intrude the repository during the 10,000-year regulatory period); and tabulates the calculational results used to construct the CCDFs reported in Volume 1. 87 figs., 18 tabs.

6433 (SAND–91-0893/3) **Preliminary comparison with 40 CFR Part 191, Subpart B for the Waste Isolation Pilot Plant, December 1991: Volume 3: Reference data.** Rechard, R.P. (Sandia National Labs., Albuquerque, NM (United States)); Peterson, A.C.; Tierney, M.S. (eds.); Schreiber, J.D.; Sandha, J.S. (eds.). Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 692p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC04-76DP00789. Order Number DE92004981. Source: OSTI; NTIS; INIS; GPO Dep.

This volume documents the data available as of August 1991, which were used by the Performance Assessment Division of Sandia National Laboratories in its 1991 preliminary performance assessment of the Waste Isolation Pilot Plant (WIPP). Ranges and distributions for about 300 modeling parameters, several of which are spatially varying parameters with between 15 and 80 point values, and about 500 well locations and corresponding stratigraphic elevations are presented in both tables and graphics for the geologic and engineered barriers, global materials (e.g., fluid properties), and agents that act upon the WIPP disposal system such as climate variability and human-intrusion boreholes. Sources for the data and a brief discussion of each parameter are also provided.

6434 (SAND–91-1827C) **Treatment of uncertainty in low-level waste performance assessment.** Kozak, M.W.; Olague, N.E.; Gallegos, D.P.; Rao, R.R. Sandia National Labs., Albuquerque, NM (United States). [1991]. 12p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (CONF-911114–1: 13. annual DOE low-level waste management conference, Atlanta, GA (United States), 19-21 Nov 1991). Order Number DE92003297. Source: OSTI; NTIS; INIS; GPO Dep.

Uncertainties arise from a number of different sources in low-level waste performance assessment. In this paper the types of uncertainty are reviewed, and existing methods for quantifying and reducing each type of uncertainty are discussed. These approaches are examined in the context of the current low-level radioactive waste regulatory performance objectives, which are deterministic. The types of uncertainty discussed in this paper are model uncertainty, uncertainty about future conditions, and parameter uncertainty. The advantages and disadvantages of available methods for addressing uncertainty in low-level waste performance assessment are presented. 25 refs.

6435 (SAND–91-2099C) **The use of expert elicitation to quantify uncertainty in incomplete sorption data bases for Waste Isolation Pilot Plant performance assessment.** Anderson, D.R. (Sandia National Labs., Albuquerque, NM (United States)); Trauth, K.M.; Hora, S.C. Sandia National Labs., Albuquerque, NM (United States). [1991]. 29p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC04-76DP00789. (CONF-9110246–1: Nuclear energy agency sorption workshop '91, Interlaken, (Switzerland), 14-22 Oct 1991). Order Number DE92002013. Source: OSTI; NTIS; INIS; GPO Dep.

Iterative, annual performance-assessment calculations are being performed for the Waste Isolation Pilot Plant (WIPP), a planned underground repository in southeastern New Mexico, USA for the disposal of transuranic waste. The performance-assessment calculations estimate the long-term radionuclide releases from the disposal system to the accessible environment. Because direct experimental data in some areas are presently of insufficient quantity to form the basis for the required distributions. Expert judgment was used to estimate the concentrations of specific radionuclides in a brine exiting a repository room or drift as it migrates up an intruding borehole, and also the distribution coefficients that describe the retardation of radionuclides in the overlying Culebra Dolomite. The variables representing these concentrations and coefficients have been shown by 1990 sensitivity analyses to be among the set of parameters making the greatest contribution to the uncertainty in WIPP performance-assessment predictions. Utilizing available information, the experts (one expert panel addressed concentrations and a second panel addressed retardation) developed an understanding of the problem and were formally elicited to obtain probability distributions that characterize the uncertainty in fixed, but unknown, quantities. The probability distributions developed by the experts are being incorporated into the 1991 performance-assessment calculations. 16 refs., 4 tabs.

6436 (SAND–91-2247C) **WIPP small scale seal performance tests: Status and impacts.** Finley, R.E.; Tillerson, J.R. Sandia National Labs., Albuquerque, NM (United States). [1991]. 11p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC04-76DP00789. (CONF-9110239–2: Solution Mining Research Institute (SMRI) semiannual meeting, Las Vegas, NV (United States), 28-29 Oct 1991). Order Number DE92003626. Source: OSTI; NTIS; INIS; GPO Dep.

Numerous small-scale in situ seal experiments have been emplaced in boreholes up to 38 in. in diameter at the WIPP. Seal materials include expansive salt concrete, bentonite, and crushed salt. Emplacement techniques stressed conventional technology and the use of available site personnel. Preliminary evaluation of the performance of these seals has been completed by using structural data from embedded instrumentation and fluid flow data from gas and brine flow measurements. Preliminary results suggest that submicrodarcy permeabilities can be obtained using these materials and that structural performance is satisfactory. 17 refs., 3 figs., 1 tab.

6437 (SKB-TR-91-35) **Storage of nuclear waste in long boreholes.** Sandstedt, H. (Tyrens, Sundbyberg (Sweden)); Wichmann, C.; Pusch, R.; Boergesson, L.; Loennerberg, B. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Aug 1991. 115p. Order Number DE92613959. Source: OSTI; NTIS (US Sales Only); INIS.

This report constitutes a feasibility study for the storage of high level radioactive waste in long TBM drilled tunnels. The report will form the basis for a comparison with other concepts in future analysis of the isolation performance in a typical Swedish rock structure. The suggested repository concept consists of three parallel, 4.5 km long, horizontal tunnels at a depth of 500 m constructed using TBM technology. The tunnel diameter will be about 2.4 m for deployment of canisters with a diameter of 1.6 m. The space between the canisters and rock will be totally sealed off by bentonite. The study comprises the design of canisters, canister handling and deposition, near field design, near field sealing and behaviour, and technical design of the repository. The report also includes a tentative time schedule and cost estimate, incorporating the construction phase and deployment of canisters. (au).

6438 (UCID-21414-Rev.1) **Thermal performance of a buried nuclear waste storage container storing a hybrid mix of PWR and BWR spent fuel rods: Revision 1.** Johnson, G.L. Lawrence Livermore National Lab., CA (United States). Nov 1991. 105p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-48. Order Number DE92004466. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory will design, model, and test nuclear waste packages for use at the Nevada Nuclear Waste Storage Repository at Yucca Mountain, Nevada. On such package would store tightly packed spent fuel rods from both pressurized and boiling water reactors. The storage container provides the primary containment of the nuclear waste and the spent fuel rod cladding provides secondary containment. A series of transient conduction and radiation heat transfer analyses was run to determine for the first 1000 yr of storage if the temperature of the tuff at the borehole wall ever falls below 97°C and whether the cladding of the stored spent fuel ever exceeds 350°C. Limiting the borehole to temperatures of 97°C or greater helps minimize corrosion by assuring that no condensed water collects on the container. The 350°C cladding limit minimizes the possibility of creep- related failure in the spent fuel rod cladding. For a series of packages stored in a 8 x 30 m borehole grid where each package contains 10-yr-old spent fuel rods generating 4.74 kW or more, the borehole wall stays above 97°C for the full 10000-yr analysis period. For the 4.74-kW load, the peak cladding temperature rises to just below the 350°C limit about 4 years after emplacement. If the packages are stored using the spacing specified in the Site Characterization Plan (15 ft x 126 ft), a maximum of 4.1 kW per container may be stored. If the 0.05-m-thick void between the container and the borehole wall is filled with loosely packed bentonite, the peak cladding temperature rises more than 40°C above the allowed cladding limit. In all cases the dominant heat transfer mode between container components is thermal radiation.

6439 (UCRL-ID-108153) **Physical limits on steam generation by radioactive decay heat.** Chesnut, D.A. Lawrence Livermore National Lab., CA (United States). Dec 1991. 7p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-48. Order Number DE92004468. Source: OSTI; NTIS; INIS; GPO Dep.

This report briefly discusses the possibilities that flood water contacting the hot radioactive waste and rock at Yucca Mountain could produce enough steam to lift the top of the mountain off the repository.

6440 (UCRL-JC-106759) **The impact of episodic nonequilibrium fracture-matrix flow on geological repository performance.** Buscheck, T.A.; Nitao, J.J.; Chestnut, D.A. Lawrence Livermore National Lab., CA (United States). 29 Oct 1991. 12p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-48. (CONF-910945-5: Focus '91: nuclear waste packaging, Las Vegas, NV (United States), 29 Sep - 4 oct 1991). Order Number DE92004673. Source: OSTI; NTIS; INIS; GPO Dep.

Adequate representation of fracture-matrix interaction during episodic infiltration events is crucial in making valid hydrological predictions of repository performance at Yucca Mountain. Various approximations have been applied to represent fracture-matrix flow interaction, including the Equivalent Continuum Model (ECM), which assumes capillary equilibrium between fractures and matrix, and the Fracture-Matrix Model (FMM), which accounts for nonequilibrium fracture-matrix flow. We analyze the relative impact of matrix imbibition on episodic nonequilibrium fracture-matrix flow for the eight major hydrostratigraphic units in the unsaturated zone at Yucca Mountain. Comparisons are made between ECM and FMM predictions to determine the applicability of the ECM. The implications of nonequilibrium fracture-matrix flow on radionuclide transport are also discussed.

6441 (UCRL-JC-106916) **Engineered barrier system and waste package design concepts for a potential geologic repository at Yucca Mountain.** Short, D.W.; Ruffner, D.J.; Jardine, L.J. Lawrence Livermore National Lab., CA (United States). Oct 1991. 13p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-48. (CONF-910945-4: Focus '91: nuclear waste packaging, Las Vegas, NV (United States), 29 Sep - 4 oct 1991). Order Number DE92004657. Source: OSTI; NTIS; INIS; GPO Dep.

We are using an iterative process to develop preliminary concept descriptions for the Engineered Barrier System and waste-package components for the potential geologic repository at Yucca Mountain. The process allows multiple design concepts to be developed subject to major constraints, requirements, and assumptions. Involved in the highly interactive and interdependent steps of the process are technical specialists in engineering, metallic and nonmetallic materials, chemistry, geomechanics, hydrology, and geochemistry. We have developed preliminary design concepts that satisfy both technical and nontechnical (e.g., programmatic or policy) requirements.

6442 (WHC-EP-0225-Rev.1) **Contact-handled transuranic waste characterization based on existing records: Revision 1.** Anderson, B.C.; Anderson, J.D.; Demiter, J.A.; Duncan, D.R.; Fort, L.A.; McCann, D.C.; Stone, S.J. Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 171p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE92002744. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the results of characterizing the retrievably stored, contact-handled transuranic (CH-TRU) waste based on existing records. This report is the first comprehensive analysis of these records. A history of the methods used in storing the transuranic waste and in determining how the data was accumulated for entry into the Richland-Solid Waste Information Management System (R-SWIMS) is also described. Data from the R-SWIMS have been the primary source of information in characterizing the waste contents. Supporting documents and interviews with knowledgeable people provide the basis for the documenting the history of storage practices. The storage conditions will be investigated further to ensure that a representative statistical sample is obtained for the second phase of this characterization program.

6443 (WHC-EP-0379) **Preliminary performance assessment strategy for single-shell tank waste disposal.** Sonnichsen, J.C. Jr. Westinghouse Hanford Co., Richland, WA (United States). Oct 1991. 59p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC06-87RL10930. Order Number DE92002912. Source: OSTI; NTIS; INIS; GPO Dep.

The disposal of the waste stored in single-shell tanks at the Hanford Site is recognized as a major environmental concern. A comprehensive program has been initiated to evaluate the various alternatives available for disposal of these wastes. Theses wastes will be disposed of in a manner consistent with applicable laws and regulations. Long-term waste isolation is one measure of performance that will be used for purposes of selection. The performance of each disposal alternative will be simulated using numerical models. Contained herein is a discussion of the strategy that has and continues to evolve to establish a general analytical framework to evaluate this performance. This general framework will be used to construct individual models of each waste disposal alternative selected for purposes of evaluation. 30 refs., 3 figs.

6444 (WHC-EP–0405-DraftA-Vol.5) **Systems engineering study for the closure of single-shell tanks: Draft A, Volume 5.** Boomer, K.D.; Boldt, A.L.; Britton, M.D.; Engelsman, L.E.; Galbraith, J.D.; Garfield, J.S.; Giese, K.A.; Golberg, C.E.; Higley, B.A.; Hull, K.J.; Johnson, L.J.; Knight, R.P.; Layman, J.S.; Marusich, R.S.; Parazin, R.J.; Piepho, M.G.; Slaathaug, E.J.; WaldoWestinghouse Hanford Co., Richland, WA (United States). Aug 1991. 502p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC06-87RL10930. Order Number DE92003071. Source: OSTI; NTIS; INIS; GPO Dep.

Several radioactive waste processing technologies, for the processing of Hanford single-shell tank wastes, are presented. Technologies presented include: ceramic grout processing; ceramic pellet facility; in-situ vitrification; a glass in sulfur facility; a containerized glass facility; mineral grout facility; salt polyethylene process; and the salt grout process. Interim storage facilities are also discussed. (CBS)

6445 (WHC-EP–0412) **Fate and transport of constituents leaked from Tank 241-A-105.** Caggiano, J.A. Westinghouse Hanford Co., Richland, WA (United States). Oct 1991. 102p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC06-87RL10930. Order Number DE92002914. Source: OSTI; NTIS; INIS; GPO Dep.

Following a January 28, 1965 sudden steam release in Tank 241-A-105, the carbon steel liner of the tank was noted to have bulged to a maximum height of about 8.5 feet (2.6 meters). Most of this bulging likely resulted from the January 28, 1965 incident. But available data indicate that some bulging during an earlier leak in 1963 when waste was being added to the tank may have contributed. By March 8, 1965, increases in radiation in the 14-05-03 leak detection lateral indicted that fluids had escaped the tank and that the liner was ruptured. Waste was subsequently transferred from Tank 241-A-105 to other tanks, and liquid levels in Tank 241-A-105 were maintained at about 18 inches to control temperature to prevent deterioration of the concrete. Spray cooling water was added weekly to the tank from February 1971 to December 1978 to maintain liquid levels and temperatures, and some of this fluid is assumed to have leaked from the tank. This study examined available data to determine, to the extent possible, the distribution of the leaked constituents in surrounding soils and whether they migrated to groundwater. In this assessment, available data from gross gamma logging of dry wells and leak detection laterals as well as data from analyses of groundwater samples were examined throughout the period of interest. Logs of wells and photographs taken during construction of the 241-A-105 Tank Farm were also examined.

6446 (WHC-EP–0451) **Candidate reagents and procedures for the dissolution of Hanford Site single-shell tank sludges.** Schulz, W.W.; Kupfer, M.J. Westinghouse Hanford Co., Richland, WA (United States). Oct 1991. 34p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC06-87RL10930. Order Number DE92002257. Source: OSTI; NTIS; INIS; GPO Dep.

At least some of the waste in the 149 single-shell tanks (SST) at the US Department of Energy (DOE) Hanford Site will be retrieved, treated, and disposed of. Although the importance of devising efficient and cost-effective sludge dissolution procedures has long been recognized, a concerted bench-scale effort to devise and test such procedures with actual solids representative of those in Hanford Site SSTs has not been performed. Reagents that might be used, either individually or serially, to dissolve sludges include HNO_3, HNO_3-oxalic acid, and HNO_3-HF. This report consolidates and updates perspectives and recommendations concerning reagents and procedures for dissolving Hanford Site SST and selected double-shell tank (DST) sludges. The principal objectives of this report are as follows: (1) Compile and review existing experimental data on dissolution of actual Hanford Site SST and DST sludges. (2) Further inform Hanford Site engineers and scientists concerning the utility of combinations of thermally unstable complexants (TUCS) reagents and various reducing agents for dissolving SST and DST sludges. (This latter technology has recently been explored at the Argonne National Laboratory.) (3) Provide guidance in laying out a comprehensive experimental program to develop technology for dissolving all types of Hanford Site SST and DST sludges. 6 refs., 1 fig., 4 tabs.

6447 (WHC-EP–0465-Vol.3-Pt.B) **The analysis of the program to develop the Nuclear Waste Management System: Allocated requirements for the Office of Civilian Radioactive Waste Management Program: Volume 3, Part B.** Woods, T.W. Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 718p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC06-87RL10930. Order Number DE92002971. Source: OSTI; NTIS; INIS; GPO Dep.

This report is volume 3, part B, of the program to satisfy the allocated requirements of the Office of Civilian Radioactive Waste Management Program, in the development of the nuclear waste management system. The report is divided into the following sections: regulatory compliance; external relations; international programs; strategic and contingency planning; contract business management; and administrative services. (CS)

6448 (WHC-EP–0492) **Office of Civilian Radioactive Waste Management decision methodology.** Hoessel, W.C. Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 68p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC06-87RL10930. Order Number DE92003630. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) Office of Civilian Radioactive Waste Management (OCRWM), in its Management System Improvement Strategy, has identified the need for a uniform decision methodology to aid in structuring program choices. This report documents the initial effort to develop such a methodology. OCRWM decision problems typically require a delicate balancing of cost, schedule, safety, performance, and risk considerations. In addition, there are usually uncertainties associated with the values of the technical parameters. The problems are made even more complex by numerous stakeholders who have diverse and, often, conflicting views. The OCRWM decision methodology has been formulated with these issues in mind. The methodology was developed as a practical tool to assist OCRWM personnel in structuring problems and selecting a preferred solution from a set of alternatives. The decision methodology is composed of two elements. The first element is a general framework that provides guidelines for use in formulating decision problems. This framework consists of several discrete steps that, if followed, will result in a traceable, documented, and supportable decision rationale. The second element of the methodology is a process that selects the preferred alternative from a set of candidates.

6449 (WHC-EP–0508-Vol.2) **Parametric studies to support inspection criteria for the Hanford Site double-shell waste storage tanks: Volume 2.** Shurrab, M.S. (Westinghouse Hanford Co., Richland, WA (United States)); Thomson, M.D.; Friley, J.R.; Garnich, M.R.; Rinker, M.W.; Simonen, F.A. Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 99p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC06-87RL10930 ;AC06-76RL01830. Order Number DE92003023. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactive waste from the chemical processing of spent nuclear fuel has been stored in double-shell tanks at the Hanford Site since 1970. A program to assure that the tanks maintain their structural integrity requires an inspection plan. To support planning, calculations of stress, stress intensity factors and concrete creep rates were made. Stresses and stress intensity factors are for a tank subjected to normal loads. Results identify locations of the highest stress and where cracks, if present, would be most detrimental to tank integrity. The corresponding report contains three evaluations of tank stresses, two evaluations of stress intensity factors, an evaluation of the effects of concrete creep. These appendices provide calculational details made for the primary report.

6450 (WHC-SA-1190) **Safe storage of deactivated radiological chemical processing plants in the 200 West Area of the Hanford Site.** Egge, R.G. Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 16p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC06-87RL10930. (CONF-910981-38: Environmental remediation '91 conference, Pasco, WA (United States), 8-11 Sep 1991). Order Number DE92002252. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the surveillance and preventive maintenance actions that are implemented in the retired chemical processing plants (S Plant and U Plant) for the US Department of Energy Field Office, Richland (RL). These actions are intended to keep the facilities in a safe storage configuration until final decommissioning, scheduled to begin in 2007, can be accomplished. 4 figs., 2 tabs.

6451 (WHC-SA-1391) **Irradiation corrosion of waste package container materials in air/steam environment.** Anantatmula, R.P.; Colburn, R.P. Westinghouse Hanford Co., Richland, WA (United States). Nov 1991. 14p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC06-87RL10930. (CONF-9104326-1: The NACE annual conference and corrosion, Nashville, TN (United States), 27 Apr - 1 may 1991). Order Number DE92004543. Source: OSTI; NTIS; INIS; GPO Dep.

A set of corrosion tests of the candidate waste container materials for the Basalt Waste Isolation Project (BWIP) was conducted in a moist air environment simulating the repository preclosure condition. The tests were performed over a four-month period with air, saturated with moisture at 50°C, passing through test chambers holding specimens at 150°C and 250°C. The test materials included A27 cast carbon steel, A387 ferritic steel, oxygen-free copper and cupronickel 90-10. Each material was tested both with and without basalt/bentonite packing material adjacent to the specimens. For each combination of material, temperature and packing condition, tests were conducted at 10,000 R/hr and 100 R/hr radiation levels. All four materials tested at 250°C showed corrosion rates as much as an order of magnitude higher in the high radiation field when compared with similar tests without irradiation. Typically, the corrosion rates were lower at the lower dose rates, but were significantly higher at 100 R/hr compared to the case without radiation. At 150°C only pure copper showed enhanced corrosion due to gamma radiation. The presence of packing material adjacent to the specimens had no consistent effect on corrosion rate at either temperature.

6452 (YJT-90-04) **Permeability and long-term durability of concrete in final repository conditions.** Pihlajavaara, S. (Valtion Teknillinen Tutkimuskeskus, Helsinki (Finland)). Voimayhtioeiden Ydinjaetetoimikunta, Helsinki (Finland). Feb 1990. 61p. (In Finnish). Order Number DE92613960. Source: OSTI; NTIS (US Sales Only); INIS.

The interrelation of the permeability properties and longterm durability especially in wet repository conditions has been studied. The study is based on the author's long-term experience, literary survey and experiments on the durability, service life prediction, and on water and gas permeability. Degradation models and experimental results on water and gas permeability are presented. The experiments made indicated that high class concrete is practically water and gas tight, especially in the long run when stored under water. This meant that there will hardly be any mass transfer into concrete or out of it, if concrete is of good quality. Concrete structures can be designed to meet the required service life. It can be said that practically the precision increases and the scatter decreases in the service life estimation significantly when the thickness of the anticipated deteriorated surface layer is smaller due to the higher concrete quality. The service life of well-designed concrete silo walls made of high class concrete can be predicted to be at least 1000 years in the repository conditions. (orig.).

6453 (DOE/RL-90-32-Rev.1) **Phase 1 and 2 feasibility study report for the Hanford Site 1100-EM-1 Operable Unit: Revision 1.** USDOE Richland Operations Office, WA (United States). Aug 1991. 108p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC06-87RL10930. Order Number DE92002044. Source: OSTI; NTIS; GPO Dep.

This Draft Phase I and II Feasibility Study is based on data and conclusions from the Phase I Remedial Investigation Report for the Hanford Site 1100-EM-1 Operable Unit. No contamination of air or surface water occurs at the 1100-EM-1 Operable Unit, and contamination of groundwater will be addressed in the Phase III Feasibility Study. Chemicals of concern in soils are established to be bis(2-ethylhexyl)phthalate (BEHP) at the Discolored Soil Site, and polychlorinated biphenyls (PCBs) at the Horn Rapids Landfill. These data are summarized in Table 2-1. The following major conclusions from the Phase I Remedial Investigation report are the basis for this Phase I and II Feasibility Study: Risks to humans are minimal, calculated to be 2×10^{-6} for the entire 1100-EM-1 Operable Unit, and below the EPA's threshold value of 1×10^{-6} at each subunit, and risks to the environment are below levels of concern for any mechanism of transport considered. 20 refs., 5 figs., 9 tabs.

6454 (EUR-13434) **The geology, hydrogeology and geochemistry of the Needle's Eye natural analogue site.** Hooker, P.J. (British Geological Survey, Keyworth (UK). Fluid Process Research Group). Commission of the European Communities, Luxembourg (Luxembourg). 1991. 30p. Contract FI1W/0073 UK. Source: OSTI; NTIS (US Sales Only).

The British Geological Survey has been carrying out a research investigation of the Needle's Eye site at Southwick on the Solway coast in south-western Scotland. This study of a naturally radioactive geochemical system has the aim of improving our confidence in using predictive models of radionuclide migration in the geosphere. This summary report describes results from the integrated use of hydrogeological, mineralogical and geochemical techniques applied to the study of the transport and distribution of uranium. Pitchblende veins exposed in the cliffs are a major source of soluble uranium in ground-waters flowing into organic-rich post-glacial flood plain and intertidal mudflat deposits. Organic matter both living and dead has played a key role in the retardation of uranium in these sediments. Chemical transport modelling of the uranium dispersion/retardation is described and the implications for performance assessment work are discussed. Computer codes used: CHEMVAL (thermodynamic data base constants). CHIMERE (chemical equilibrium code). METIS (flow code). PHREEQE (chemical equilibrium code). STELE (coupled chemical transport code).

6455 (HAN-18510) **Suggested hydrologic investigations at the Hanford Directed Operations.** Piper, A.M. Geological Survey, Portland, OR (United States). 25 Aug 1948. 21p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004545. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum is an outline of hydrologic investigations that seem desirable at the Hanford Directed Operations of the Atomic Energy Commission. In its present form, the outline is tentative and is intended as a basis for further considerations in the Commission, the Geological Survey, and other agencies concerned. In scope, it seeks to cover (1) advisory functions to the Atomic Energy Commission and its prime contractor with respect to an evaluation of the continuing hazards due to process wastes, also with respect to water-supply problems of the expanding operations at Hanford; also (2) civilian-protection aspects of possible emergencies, especially in the region adjacent to the Hanford reservation.

6456 (DOE/RL–90-37-Rev.1) **Remedial investigation Phase 2 supplemental work plan for the Hanford Site 1100-EM-1 Operable Unit: Revision 1.** Department of Energy, Richland, WA (United States). Richland Operations Office. Sep 1991. 127p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC06-87RL10930. Order Number DE92002045. Source: OSTI; NTIS; GPO Dep.

The 1100 Area, the central warehousing, vehicle maintenance, and transportation operations center for the Hanford Site, was designated an (NPL) National Priorities List site in July 1989. This NPL site was divided into four operable units, and the first equipment maintenance operable unit, 1100-EM-1, was assigned the highest priority. The following summary focuses on the major issues related to contaminant sources, meteorology, surface hydrology, geology, pedology, hydrogeology, and ecology. The 110-EM-1 Phase 1 R1 report recommended further investigation at six waste management units assigned to or within the operable unit. 1100-1 (Battery Acid Pit)–an unlined dry sump, or french drain, used for the disposal of waste acid from vehicle batteries; 1100-2 (Paint and solvent Pit)–a former sand and gravel pit subsequently used for the disposal of construction debris and, reportedly, waste paints, thinner, and solvents; 1100-4 (Antifreeze Tank Site)–The site of a former underground storage tank used for the disposal of waste vehicle antifreeze; UN-1100-6 (Discolored Soil Site)–the location of an apparent disposal event onto the ground surface involving a container of organic waste liquids; Horn Rapids Landfill–a solid waste facility used primarily for the disposal of office and construction waste and the burning of classified documents; asbestos, sewage sludge, fly ash, and, potentially, drums of unidentified organic liquids alleged to be disposed at this location; and Ephemeral Pool–the location of 1100 Area parking lot runoff accumulation during infrequent, high-intensity precipitation events. This remedial investigation supplemental work plan details the efforts for final characterization of the 1100-EM-1 Operable Unit that will provide data to be used for the evaluation of remedial operations in the Phase 3 1100-EM-1 feasibility study. 19 refs., 28 figs., 2 tabs.

6457 (EGG-WTD–9899) **Technology status report: Transuranic contamination control at INEL.** Loomis, G.G. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1991. 16p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC07-76ID01570. Order Number DE92003264. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes proposed FY-92 work at the Idaho National Engineering Laboratory (INEL) in the field of contamination control during transuranic waste handling operations. The proposed work is both applied research and demonstration testing. The INEL needs for contamination control applied research and demonstration testing are listed along with a description of past accomplishments. The INEL proposal is compared to other proposals for contamination control work that are under consideration for funding by the Department of Energy. Benefits of this work and impacts of not sponsoring this work are also given. 21 refs.

6458 (ES/ER/TM–7) **Summary of the landfill remediation problems and technology needs of the Oak Ridge Reservation Environmental Restoration Programs.** Oak Ridge National Lab., TN (United States). Jan 1991. 97p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. Order Number DE92003714. Source: OSTI; NTIS; INIS; GPO Dep.

Presented by D.W. Swindle, Director, Technical Integration, Environmental Restoration Division at the DOE workshop on robotics for landfill remediation, Panama City, FL, January 9-10, 1991.

This report discusses the following topics: brief description of the Oak Ridge Reservation Environmental Restoration Program; descriptions of representative waste burials at each site; ongoing, planned, or potential remediation; known or anticipated remediation problems; potential applications for robotics in the remediation of Oak Ridge Reservation landfills.

6459 (HW–46104) **Manual of standard procedures for 100, 200, and 300 Area survey work.** Smith, J.M. Jr. (comp.). Hanford Works, Richland, WA (United States). 1 Dec 1949. 160p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92002891. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes procedures and policies for the survey work in the 100, 200, and 300 areas of the Hanford Works. Topics include: health monitoring instruments, calibration, stationary instruments, portable instruments, special hazards bulletins, current permissible radiation exposure limits, standard procedure for skin decontamination, survey record sheets, air sampling, special work permits, protective clothing, contamination control, radiation danger zone tool room, decontamination, measurement of effluent water activity, the discharge area, hazard areas, radiation protection policies, uranium handling rules, and radiation hazards in the uranium processing buildings. (JL)

6460 (LA–12222-PR) **Health, Safety, and Environment Division annual report 1989.** Wade, C. (comp.). Los Alamos National Lab., NM (United States). Jan 1992. 69p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. Order Number DE92005352. Source: OSTI; NTIS; GPO Dep.

The primary responsibility of the Health, Safety, and Environment (HSE) Division at the Los Alamos National Laboratory is to provide comprehensive occupational health and safety programs, waste processing, and environmental protection. These activities are designed to protect the worker, the public, and the environment. Meeting the responsibilities involves many disciplines, including radiation protection, industrial hygiene, safety, occupational medicine, environmental science and engineering, analytical chemistry, epidemiology, and waste management. New and challenging health, safety, and environmental problems occasionally arise from the diverse research and development work of the Laboratory, and research programs in the HSE Division often stem from these applied needs. These programs continue but are also extended, as needed, to study specific problems for the Department of Energy. The result of these programs is to help develop better practices in occupational health and safety, radiation protection, and environmental sciences.

6461 (ORAU–91/J-20) **Ionizing radiation risk assessment, BEIR IV.** Committee on Interagency Radiation Research and Policy Coordination, Washington, DC (United States). Oct 1991. 31p. Sponsored by U.S. Department of Defense. DOE Contract AC05-76OR00033. (CIRRPC–8). Order Number DE92004014. Source: OSTI; NTIS; INIS; GPO Dep.

This report of the Subpanel discusses the potential impact on Federal agencies and indicates individual risk factors that could be used by them in risk assessment. The approach used in this CIRRPC report was to consider the risk factors presented in BEIR IV for each radionuclide (or group radioelements) and to make some judgments regarding their validity and/or the uncertainties involved. The coverage of Radon-222 and its progeny dominated the BEIR IV report and this Subpanel felt is was proper to devote more attention to this radionuclide family. This risk factor presented in BEIR IV for radon is 350 cancer deaths per million person-working level months (WLM) of exposure for a lifetime. There is a range of opinions on the conversion from WLM to absorbed dose. As discussed in the text, the use of the WLM concept makes it difficult or infeasible to compare the risk factor for radon with that of other radionuclides which are based on organ dose. This report also includes a discussion of certain fundamental scientific and operational issues that may have decisive effect upon risk factor selection. These adjunct items are dealt with under separate headings and include discussions of threshold dose considerations, extrapolation to low doses, and age at exposure.

6462 (ORNL/ER–60) **Annual summary report on surveillance and maintenance activities of the surplus contaminated facilities program at Oak Ridge National Laboratory for period ending September 30, 1991.** Cannon, T.R.; Ford, M.K.; Holder, L. Jr. Oak Ridge National Lab., TN (United States). Sep 1991. 5p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. Order Number DE92003745. Source: OSTI; NTIS; INIS; GPO Dep.

The Surplus Contaminated Facilities Program (SCFP) was established at the Oak Ridge National Laboratory (ORNL) in 1985 to provide support for inactive contaminated facilities that were largely abandoned by the programs which they formerly served. This support provides for routine surveillance and maintenance (S&M) and special projects beyond a routine nature when such actions are needed to ensure adequate protection of personnel or the environment. The facilities included in the program had been used for research, technology development, isotope production and processing, and waste management. Support for facilities in the SCFP has previously been provided by the Department of Energy's (DOE's) Office of Energy Research: Multiprogram Energy Laboratories – Facilities Support (ERKG) because of multiprogram use of the facilities or because of the landlord responsibility of Energy Research. Recently, an integrated Decontamination and Decommissioning (D&D) program within the DOE Office of Environmental Restoration and Waste Management has been established to collectively manage the former Surplus Facilities Management Program, Defense D&D Program, and the KG-funded, ORNL-originated SCFP. This report gives an overview of the S&M planning, routine S&M, and special maintenance project activities which have occurred at the SCFP facilities during the 1991 Fiscal Year.

6463 (ORNL/RASA–89/18) **Results of the Radiological Survey at Conviber, Inc., 644 Garfield Street, Springdale, Pennsylvania (CVP001).** Foley, R.D.; Cottrell, W.D.; Crutcher, J.W. Oak Ridge National Lab., TN (United States). Health and Safety Research Div. Oct 1991. 19p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. Order Number DE92004589. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Formerly Utilized Sites Remedial Action Program (FUSRAP), the US Department of Energy (DOE) is implementing a radiological survey program to determine the radiological conditions at sites that were used by the department's predecessor agencies. During the mid-1940s, and possibly continuing until 1951, the Conviber site in Springdale, Pennsylvania, was used to machine extruded uranium in support of government efforts. In 1980 a radiological scanning survey of this site was conducted by DOE and Argonne National Laboratory (ANL) staffs. Their report noted one anomaly: elevated radiation levels over a small area inside the building where uranium had been machined. Because much of the floor was inaccessible, for surveying and because of the lack of definitive records documenting use of this site, a comprehensive radiological assessment was recommended. The radiological survey discussed in this report for the site of Conviber, Inc., Springdale, Pennsylvania, was conducted by members of the Measurement Applications and Development Group of Oak Ridge National Laboratory in June of 1989. The survey included a surface gamma scan, collection of concrete and soil samples, and measurement of direct and removable alpha and beta-gamma contamination. One indoor location with a gamma measurement of 20 μR/h was found. In June of 1990 ORNL staff returned to investigate the location with elevated gamma. A hole was drilled through the concrete, gamma measurements were taken, and soil samples were obtained for analyses. In these eight indoor soil samples, concentrations of ^{238}U ranged from 90 to 20,000 pCi/g. However, under current site use, residual uranium covered by concrete does not pose a health risk.

6464 (WHC-EP–0405-Draft.A-Vol.3) **Systems engineering study for the closure of single-shell tanks: Draft A, Volume 3.** Boomer, K.D.; Baker, S.K.; Boldt, A.L.; Britton, M.D.; Engelsman, L.E.; Galbraith, J.D.; Garfield, J.S.; Giese, K.A.; Golberg, C.E.; Higley, B.A.; Hull, K.J.; Johnson, L.J.; Knight, R.P.; Layman, J.S.; Marusich, R.S.; Parazin, R.J.; Piepho, M.G.; SlaathaugWestinghouse Hanford Co., Richland, WA (United States). Aug 1991. 369p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC06-87RL10930. Order Number DE92003140. Source: OSTI; NTIS; INIS; GPO Dep.

Disposal alternatives of single shell tank wastes (SSTs), high-level and transuranic wastes, are being evaluated at the Hanford Reservation. This report, volume 3, draft a, contains appendices on the following: public involvement; incremental impact of double-shell tank waste to SST waste functions; SST radionuclide and chemical information; evaluation of alternatives and; waste retrieval and transfer. (CBS)

6465 (WHC-EP–0427-Pt.2) **Hanford Waste Vitrification Systems Risk Assessment: Final report supporting information: Part 2.** Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 482p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC06-87RL10930. Order Number DE92003284. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains Double-shell Tank Waste Risk Analysis Forms. The worksheets prepared in developing assessments on individual activities are presented in this appendix. The assessment of each schedule activity required completion of a minimum of three forms, a Risk Analysis Results Form, an Input to Science Applications International Corporation (SAIC) Form, and an Uncertainty Report Form. A Risk Analysis Results Form was used to identify the assessments made with respect to a given activity. An Input to SAIC Form was used to identify the optimistic, most likely, and pessimistic costs and durations for the activity, as well as the probability of completing the activity within the most likely duration. The rationale used in developing the input is also provided in this appendix. The activity assessment worksheets are grouped by the seven major program activities, i.e., characterization, retrieval, pretreatment technology, pretreatment facilities, Hanford Waste Vitrification Plant, grout, and Tank Farms.

6466 (WHC-EP–0474-1) **Quarterly report on Defense Nuclear Facilities Safety Board Recommendation 90-7.** Cash, R.J. Westinghouse Hanford Co., Richland, WA (United States). Aug 1991. 43p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC06-87RL10930. Order Number DE92002188. Source: OSTI; NTIS; GPO Dep.

This is the first quarterly report on the progress of activities addressing safety issues associated with Hanford Site high-level radioactive waste tanks than contain ferrocyanide compounds. An implementation plan (Cash 1991) responding to the Defense Nuclear Facilities Safety Board Recommendation 90-7 (FR 1990) was issued in March 1991 describing the activities planned and underway to address each of the six parts of the recommendation. All of the activities listed in the implementation plan are underway. Although a lack of full funding, technical difficulties, and resource limitations delayed some of the work, noteworthy progress has been made in achieving many of the milestones. The progress made includes the following. Thermal modeling shows that significant hot spots within the waste are highly unlikely, if not impossible. Continuous temperature monitoring was installed ahead of schedule on two of the highest interest tanks, and five additional tanks will be on-line in September with 10 tanks total on-line by December. Accuracy checks of tank instrument trees show most thermocouples are reading correctly. Tank intrusive sampling is proceeding, and the first core samples will be obtained on schedule in October. Chemical reaction studies are underway with synthetic ferrocyanide compounds believed to be more representative of the ferrocyanide materials actually deposited in the tanks. Tests indicate that water plays a major role in impeding a possible runaway reaction. An emergency planning exercise was conducted in May, and a validation of updated procedures and a second emergency exercise is scheduled for October. 13 refs., 2 figs., 3 tabs.

6467 (WHC-EP–0474-2) **Quarterly report on Defense Nuclear Facilities Safety Board Recommendation 90-7.** Cash, R.J.; Dukelow, G.T. Westinghouse Hanford Co., Richland, WA (United States). Oct 1991. 78p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC06-87RL10930. Order Number DE92004566. Source: OSTI; NTIS; INIS; GPO Dep.

This is the second quarterly report on the progress of activities addressing safety issues associated with Hanford Site high-level radioactive waste tanks that contain ferrocyanide compounds. An implementation plan (Cash 1991) responding to the Defense Nuclear Facilities Safety Board Recommendation 90-7 (FR 1990) was issued in March 1991 describing the activities planned and underway to address each of the six parts of the recommendation. All of the activities listed in the implementation plan are underway, including the multifunctional instrument tree and infrared tasks which resumed in late July. Although technical difficulties and resource limitations delayed some work, noteworthy progress has been made in completing a number of ferrocyanide program milestones.

Thermal modeling shows that the heat loading of tank 241-BY-104 is much lower than previously listed and that significant hot spots within the waste are highly unlikely, if not possible. Computerized continuous temperature monitoring was installed on schedule on five of the highest interest tanks and five additional tanks will be on-line in December. Tank intrusive sampling is proceeding and the first vapor samples were obtained in mid-October. Spectral scans were completed for twelve tanks and substantial progress was made on design of an infrared scanning system. Chemical reaction studies are underway with synthetic ferrocyanide compounds believed to be more representative of the ferrocyanide materials actually deposited in the tanks. Tests indicate that water plays a major role in impeding a possible runaway reaction. An emergency planning exercise was conducted in May, emergency procedures were updated this quarter, and validation of the procedures and a second emergency exercise is scheduled for October.

6468 (Y/ER–19) **Revised RCRA Closure Plan for the Interim Drum Yard (S-030) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee: Revision of Y/TS-347/1R3.** Oak Ridge Y-12 Plant, TN (United States). Aug 1991. 26p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OS21400. Order Number DE92003900. Source: OSTI; NTIS; INIS; GPO Dep.

The Interim Drum Yard (S-030) is an outdoor storage area for containerized hazardous waste. The yard is constructed of gravel on native soil and has no liner or containment system. Drums of waste are stored on wooden pallets. A list of wastes that are or have been stored at this facility is given in this report. This report discusses inventory removal, disposal, and decontamination. 4 refs., 3 figs., 4 tabs.

0550 Safeguards, Inspection, and Accountability

6469 (ENEA-RT-NUCL–90-24) **Fissile material safeguards: Technological aspects.** Aparo, M.; Grossi, G.; Frazzoli, F.V.; Remetti, R. ENEA, Casaccia (Italy). Area Nucleare; Rome Univ. (Italy). Dipt. di Energetica. Jun 1991. 52p. (In Italian). (RT/NUCL–90-24). Order Number DE92744028. Source: OSTI; NTIS (US Sales Only).

A short description of the need for nuclear materials safeguards and of their historical-political evolution introduces, as the main topic, an overview of the technical features of safeguard systems. Particular attention is devoted to fissile material measuring processes in current use and those under the research and development phase. The final topic focuses on possible extensions of safeguard methodologies to fields other than the nuclear one.

6470 (IAEA-INFCIRC–396) **Letter of 5 December 1991 to the Director General from the Resident Representative of Iraq to the Agency.** International Atomic Energy Agency, Vienna (Austria). 7 Jan 1992. 4p. Order Number DE92615192. Source: OSTI; NTIS (US Sales Only); INIS.

Hard copies are available in Arabic and English from IAEA Division of Publications, Distribution Unit.

The document reproduces a letter dated 5 December 1991 to the Director General of the IAEA from the Resident Representative of Iraq to the International Atomic Energy Agency concerning the presentation of a Distinguished Service Award to Mr. David Kay for his activity in the Safeguard inspections in Iraq (Attachment 1). The Director General's reply is reproduced in Attachment 2.

6471 (IAEA-R–4273-F) **Laser surveillance system (LASSY).** Boeck, H. International Atomic Energy Agency, Vienna (Austria). Sep 1991. 13p. Order Number DE92615187. Source: OSTI; NTIS (US Sales Only); INIS.

Laser Surveillance System (LASSY) is a beam of laser light which scans a plane above the water or under-water in a spent-fuel pond. The system can detect different objects and estimates its coordinates and distance as well. LASSY can operate in stand-alone configuration or in combination with a video surveillance to trigger signal to a videorecorder. The recorded information on LASSY computer's disk comprises date, time, start and stop angle of detected alarm, the size of the disturbance indicated in number of deviated points and some other information. The information given by the laser system cannot be fully substituted by TV camera pictures since the scanning beam creates a horizontal surveillance plan. The engineered prototype laser system long-term field test has been carried out in Soluggia (Italy) and has shown its feasibility and reliability under the conditions of real spent fuel storage pond. The verification of the alarm table on the LASSY computer with the recorded video pictures of TV surveillance system confirmed that all alarm situations have been detected. 5 refs.

6472 (KAERI/RR–966/90) **Studies on the establishment of nuclear safety policy.** Koh, Byung Ryung (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Ko, Seong Eun; Park, Yun Pyo; Hong, Eon Yung; Lee, Byoung Oon. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 159p. (In Korean). Order Number DE92615186. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of these studies, as the first step to enhance the safety and confidence on nuclear facilities, is to establish a long-term plan for nuclear safety researches including environmental monitoring. These studies have been performed for two parts (long-term plan for nuclear safety researches and improvement on environmental radiation monitoring). The results of 1990 studies and the plan of the future studies are as follows: 1. A Long-Term Plan for Nuclear Safety Researches The research direction and status of nuclear safety of the nuclear advanced countries, such as the U.S.A. and Japan, have been analyzed and compared to those of Korea. Based on these results, a long-term nuclear safety research plan have been suggested for eight areas (1. Severe Accident, 2. PRA, 3.Thermo-Hydraulic Transients, 4.Inspection and Maintenance for Operating Plant, 5. Seismology, 6. Human Factors, 7.Radioactive Waste Management, 8. Environmental Safety). In the future, the implementation methods including budget and manpower development program will be studied, and discussed with the government and related organizations to establish the final plan. 2. Improvement in Environmental Radiation Monitoring System The practice system, law and program of environmental radiation monitoring of the U.S.A. and Japan are surveyed and analyzed to provide the improvement in the domestic environmental radiation monitoring system. The results of these studies will be used in setting up the national provisions for environmental radiation monitoring system. (Author).

6473 (LA–12214-M) **THIEF: An interactive simulation of nuclear materials safeguards and security.** Stanbro, W.D.; Henriksen, P.W. Los Alamos National Lab., NM (United States). Dec 1991. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92004116. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This users manual is a guide to THIEF 2.0, an interactive simulation of safeguards and security at a nuclear facility. The program allows the user to create a model of a particular nuclear facility along with its safeguards features and then play the part of an adversary trying to steal special nuclear material from the facility. The program runs on IBM PC-compatible microcomputers with a minimum of 640 kbytes of RAM, and EGA or VGA graphics card, and preferably a color monitor.

6474 (LA-UR–91-3559) **Miniature-MCA technology developments.** Halbig, J.K.; Klosterbuer, S.F.; Stephens, M.M.; Biddle, R.S. Los Alamos National Lab., NM (United States). [1991]. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-911106–36: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92003856. Source: OSTI; NTIS; GPO Dep.

We have recently reduced the size of multichannel analyzers (MCAs) and have implemented more features in hardware to relieve software requirements. We built and tested a spectroscopy grade, 4096-channel MCA. Exclusive of amplifier and power supply, it fits on two boards each approximately 7 by 15 cm. This paper discusses the features and performance of the analyzer and some reasonable applications of these technologies.

6475 (MLM–3724(OP)) **Retrofittable electrical heater standard for the calibration of heat flow calorimeters.** Kasperski, P.W.; Wetzel, J.R.; Duff, M.F.; Fultz, R.L.; Breakall, K.L.; Renz, D.P. EG and G Mound Applied Technologies, Miamisburg, OH (United States). [1991]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-910901–24: 4. international conference on facility operations/safeguards interface, Albuquerque, NM (United States), 29 Sep - 4 oct 1991). Order Number DE92004011. Source: OSTI; NTIS; INIS; GPO Dep.

The possibility of using a nonnuclear source for calorimeter calibration has been discussed for several years. The use of electrical heaters to replace the currently used plutonium 238 sources had been taken into consideration, but until the currently used calorimeter electronics were developed, this consideration was not a practical one. An electrical resistance heater has been developed at Mound to replace the currently used plutonium 238 standards. The use of this heater should alleviate problems caused by the use of fissile materials in the laboratory in regard to environmental, safety and health concerns. Its replacement of the Pu 238 standards will also alleviate the problems and expense incurred with the transportation of SNM's between the Labs which is currently required for their calibration. The electrical standard that was developed at Mound is a very practical device that can be inexpensively produced for wide use in DNA labs throughout the complex. It has a wide range of operation, and can be designed for use in practically any calorimeter. The data reproduced here illustrates that the output from a device such as this is extremely close to the power output produced from the traditional plutonium standards. A mathematical correction factor can be applied to the curve produced by the heater output data so that this curve replicates the PU 238 data curve. This will allow the replacement of the plutonium heat standards by the electrical heater for use in calorimeter calibration. 2 refs.

6476 (NUREG–1322) **Acceptance criteria for the evaluation of Category 1 fuel cycle facility physical security plans.** Dwyer, P.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safeguards and Transportation. Oct 1991. 26p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This NUREG document presents criteria developed from US Nuclear Regulatory Commission regulations for the evaluation of physical security plans submitted by Category 1 fuel facility licensees. Category 1 refers to those licensees who use or possess a formula quantity of strategic special nuclear material.

6477 (NUREG/CR–5722) **Interior intrusion detection systems.** Rodriguez, J.R. (Sandia National Labs., Albuquerque, NM (United States)); Matter, J.C.; Dry, B. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safeguards and Transportation; Sandia National Labs., Albuquerque, NM (United States); BE, Inc., Barnwell, SC (United States). Oct 1991. 100p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (SAND–91-0948). Source: OSTI; NTIS; INIS; GPO.

The purpose of this NUREG is to present technical information that should be useful to NRC licensees in designing interior intrusion detection systems. Interior intrusion sensors are discussed according to their primary application: boundary-penetration detection, volumetric detection, and point protection. Information necessary for implementation of an effective interior intrusion detection system is presented, including principles of operation, performance characteristics and guidelines for design, procurement, installation, testing, and maintenance. A glossary of sensor data terms is included. 36 figs., 6 tabs.

6478 (PNL–7871) **Savannah River Restart Peer Evaluation Program final examination report.** Morgan, M.P.; Draper, D.G. Pacific Northwest Lab., Richland, WA (United States). Dec 1991. 61p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004849. Source: OSTI; NTIS; GPO Dep.

During the period of August 13, 1990 through September 6, 1991 the Savannah River Peer Evaluation Program was administered during three distinct phases to 73 certified Central Control Room Operators, Central Control Room Supervisors, and Shift Technical Engineers assigned to the K Reactor, on the Savannah River Site (SRS). This program was conceived and developed by the Department of Energy (DOE) and it's implementation satisfies recommendations made by the Defense Nuclear Facilities Safety Board. The review identified both strengths and weaknesses of the procedures and personnel.

6479 (UCRL-ID–106454-91-1) **Lawrence Livermore National Laboratory safeguards and security quarterly progress report to the Department of Energy Office of Safeguards and Security, quarter ending March 31, 1991.** Ruhter, W.D.; Al-Ayat, R.; Cole, C.E.; Thomas, L.L. Lawrence Livermore National Lab., CA (United States). Apr 1991. 31p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE91015088. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This progress report summarizes the quarterly activities for four programs at Lawrence Livermore National Laboratory (LLNL). The Safeguards Technology Program (STP) at Livermore supports the Technology Development Program of the Office of Safeguards and Security (OSS) in three subprogram areas (tasks): (1) Science and Technology Base Development; (2) Onsite Testa and Evaluation and Facility Support; and, (3) International Safeguards. The overall goal of the Safeguards Systems Studies program is to provide state-of-the-art analytic tools for evaluating the effectiveness of safeguards and security systems. These tools should address the spectrum of threats including theft and sabotage of nuclear material by nonviolent or violent insiders. Tools developed are to transferred to the users community. The overall goal of the Computer Security – Distribution Systems program is to conduct research and development into network security monitoring, computer virus and malicious code defensive mechanisms, system security maintenance software, distributed audit standards and requirements, a vulnerability reporting program, and system integrity concepts. The primary effort of atomic vapor laser isotope separation (AVLIS) work is to ensure coordination of the AVLIS safeguards and security systems RD&D. It provides planning, support and independent review of safeguards and security system requirements to ensure they are cost effective and integrated into the AVLIS equipment and systems, design and operation; and, plan and support safeguards instrumentation technology to evaluate and develop the instrumentation for detection of HEU production in an AVLIS separator.

6480 (UCRL-JC–104494) **A nuclear material sampling plan.** Parrish, C.P.; Mensing, R.W. Lawrence Livermore National Lab., CA (United States). Jul 1990. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9007106–86: 31. Institute of Nuclear Materials Management (INMM) conference, Los Angeles, CA (United States), 15-18 Jul 1990). Order Number DE92003975. Source: OSTI; NTIS; GPO Dep.

DOE Order 5633.3 requires that the accountable nuclear material holdings be inventoried at bi-monthly, semi-annual and annual intervals. This paper will describe a sampling plan designed to bound the total inventory difference. It is used in conjunction with a computerized nuclear material accountability system. The computer executes a statistical algorithm for selecting inventory items for measurement and produces a report listing those items to be inventoried. Based on verification or confirmatory measurements of the inventoried items, the computer calculates the estimated total inventory difference and accepts or rejects a hypothesis of no inventory difference. If the hypothesis is not rejected, one concludes, with specified level of confidence, that the total inventory difference is less than a specified threshold value. The computer maintains a permanent data base describing the inventory items sampled and the results of the statistical analysis.

For IRMPA/D (Infrared Multi-photon Absorption /Dissociation) studies, we measured IR fluorescence emitted from vibrationally excited DF* or HF* produced in IRMPD of CDF^3/CHF^3 using ir monochromator and InSb ir detector. We could detect the ir fluorescence of HF from the sample mixture CDF^3/CHF^3 to which the CDF^3 was selectively irradiated. This means that the molecular selective excitation of CDF^3 in CDF^3/CHF^3 mixture did not give molecular selective dissociation of CDF^3 because of the fast intermolecular vibrational energy transfer from the excited state CDF^3 to the ground state CHF^3. This technique will play important role for measuring isotope selectivity in IRMPD of CDF^3/CHF^3. We developed data analysis technique for the laser fluorometer to improve analytical speed and accuracy. We calculated a fluorescence intensity at time zero using two values obtained by integration of two intervals on time-resolved fluorescence signal. Applying this method, we could eliminate any interference effects from quenching elements or temperature fluctuations of samples, effectively. The applications of the instrument were broadened to the analyses of rare-earth elements and the trace analyses of Sm, Eu, Tb and Dy were successfully performed. To improve resolution of the hologram, a bleaching method of silver halide emulsion hologram was investigated. The optimum condition for making transmission phase hologram of the silver halide photographic plate was also studied. The effects of the developer, the bleaching solution and the drying process were experimentally measured. The new recording geometry of the reflection hologram with high resolution and high efficiency was investigated theoretically and experimentally. And we compared this new method with conventional one. (Author).

6487 (UCRL–53868-90, pp. 4.19-4.23) **Preventing seizure of sliding-contact bearings in hot, high-vacuum environments.** Mosleh, M. (Massachusetts Inst. of Tech., Cambridge (United States)); Suh, N.P.; Stowers, I.F. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The goals of this research are to extend the operating life of dry, sliding-contact bearings in high-vacuum, high-temperature environments and to prevent their premature seizure. The authors have designed and built a high-vacuum apparatus (10^{-6} Torr) and used it to conduct high-temperature friction and wear tests on a sliding-contact bearing assembly consisting of a copper shaft rotating in a stationary stainless steel bushing. The approach taken to solving the friction problem is to make the surface of the shaft undulated (wavy) rather than smooth. Undulated surfaces have low-friction characteristics due to their ability to trap wear particles and prevent them from agglomerating, which appears to be the ultimate cause of seizure.

According to the transfer of irradiation facilities such as 110 kCi Co-60 irradiator, 1 kCi Co-60 irradiator and 300 keV electron beam accelerator from Seoul to Taejon, there is in need of preparations for the re-establishment and safe operation of the facilities. Maintaining optimal condition of the facilities is essential to meet the needs from industries, institutes, universities and regional cooperative programs. Efficient management of the facilities as well as process improvement of irradiation is also significant for the promotion of radiation processing technology which can contribute to energy saving and environment preservation. The present process of 110 kCi Co-60 irradiator for sterilization of medical products was improved by redesigning the carrier system so that even bulky samples can be irradiated. Radiation safety of 1 kCi Co-60 irradiator could be strengthened through the modification of operation protocol and safety systems. The present conveyor system of electron beam accelerator suitable only for thin samples was improved so that even bulky sample could be irradiated. The improved conveyor system was designed with mobile wheel, and irradiation room was designed with rail on the floor. To prevent the loss of insulating gas from disassembling of power supply and accelerator, a recovery apparatus of the gas was prepared. (Author).

Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Mar 1991. 50p. (In Korean). Order Number DE92615042. Source: OSTI; NTIS (US Sales Only); INIS.

Mixing rates of powdered raw materials of welding electrodes were measured using technetium-99m adsorbed raw material components as tracer. (1) Adsorbed technetium-99m was not detached during studies. (2) Taking more than 10 samples of the smallest possible but equal size at definite mixing stages were important in assuring reliability. (3) Mixing rates were independent on mixing ratio of the two components insofar as the specific gravity and grain size are same. (4) Mixing rates were inversely proportional to the specific gravity and grain size but proportional to mixing ratios in case of the specific gravity difference was more than 1.5. (Author).

6497 (WHC-SA–1259-Rev.1) **Modification of hot cells for general purpose heat source assembly at the Radioisotope Power Systems Facility: Revision 1.** Carteret, B.A. Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 10p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-920104–4-Rev.1: 9. symposium on space nuclear power systems, Albuquerque, NM (United States), 13-16 Jan 1992). Order Number DE92001807. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Eight existing, unused hot cells currently are being modified for use in the Radioisotope Power Systems Facility (RPSF) to assemble ^{238}Pu-fueled heat sources for Radioisotope Thermoelectric Generators (RTGs). Four air atmosphere cells will be used for storage, decanning, and decontamination of the iridium-clad radioisotope fuel. The remaining four argon atmosphere cells will be used to assemble fuel and graphite components for production and packaging of general purpose heat source (GPHS) assembly modules, which provide heat to drive the thermoelectric conversion process in the generators. The hot cells will be equipped to perform remote and glovebox-type operations. They will provide shielding and contamination control measures to reduce worker radiation exposure to levels within current US Department of Energy (DOE) guidelines. Designs emphasize the Westinghouse Hanford Company (Westinghouse Hanford) as low as reasonably achievable (ALARA) radiation protection policy. 3 refs., 3 figs.

6498 (INIS-mf–13058) **Facts about food irradiation: Safety of irradiation facilities.** ICGFI fact series. International Consultative Group on Food Irradiation (ICGFI). Food and Agriculture Organization of the United Nations, Rome (Italy); World Health Organization, Geneva (Switzerland); International Atomic Energy Agency, Vienna (Austria). May 1991 4p. Order Number DE92613601. Source: OSTI; NTIS (US Sales Only); INIS.

This fact sheet considers the safety of industrial irradiation facilities. Although there have been accidents, none of them has endangered public health or environmental safety, and the radiation processing industry is considered to have a very good safety record. Gamma irradiators do not produce radioactive waste, and the radiation sources at the facilities cannot explode nor in any other way release radioactivity into the environment. 3 refs.

6499 (BNL–46778) **Chemistry of intermetallic hydrides.** Reilly, J.J. Brookhaven National Lab., Upton, NY (United States). [1991]. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-911047–9: 180. meeting of the Electrochemical Society, Phoenix, AZ (United States), 13-18 Oct 1991). Order Number DE92005000. Source: OSTI; NTIS; GPO Dep.

Certain intermetallic hydrides are safe, convenient and inexpensive hydrogen storage compounds. A particular advantage of such compounds is the ease with which their properties can be modified by small changes in alloy composition or preparation. This quality can be exploited to optimize their storage properties for particular applications, e.g. as intermetallic hydride electrodes in batteries. We will be concerned herein with the more important aspects of the thermodynamic and structural principles which regulate the behavior of intermetallic hydrogen systems and then illustrate their application using the archetype hydrides of LaNi5, FeTi and Mg alloys. The practical utility of these classes of materials will be briefly noted.

6500 (CRIE-U–90054) **Development of technology for plantlet propagation by tissue culture. (3).: Strawberry callus growth and changes in pH in liquid medium.** Yoshihara, T. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)); Hanyo, H. Central Research Inst. of Electric Power Industry, Abiko, Chiba (Japan). Feb 1991. 27p. (In Japanese). Order Number DE92749206. Source: OSTI; NTIS (US Sales Only).

Development of strawberry cultivation plants is described as a part of night-time power utilization activities for power load levelling. Strawberry calluses (undifferent tissue mass) cultured in a liquid medium reach the fastest growth period in one week and the steady state in four weeks. The callus growth shows the maximum value at this time, which was 20 times as much of the seedling. The medium pH changed in a range from 4 to 7. If the initial pH is 4.0 or higher, no difference is created in the callus propagation in the steady state period, but at 3.0, no propagation whatsoever. The pH after the fastest growth period converged to a range from 6.0 to 7.0, with the exception of initial pH at 3.0. The medium pH decreased as a result of pre-culture heating sterilization, formation of iron phosphate due to light irradiation, and organic acid release during the initial growth phase. The pH increased because of difference in the speed of absorbing ammonium and nitric acid during the later growth phase. The growth efficiency of 20 times is about the same as other plants. Since the pH change is maintained within the range from 4 to 7, which causes no difference in in growth, there is no need of adjusting the pH within this range. 18 refs., 15 figs., 3 tabs.

The first section provides an introduction to the problems of biotechnical data analysis. Its aim is to give a preliminary understanding of an interactive data analysis system. The methods used are therefore first explained in an informal way. In the following sections the theoretical premises are systematically laid out and the methods precisely explained. (orig.).

6502 **Process of converting starch to glucose and glucose to lactic acid.** Tsai, TenLin; Sanville, C.Y.; Coleman, R.D.; Schertz, W.W. To Dept. of Energy. 1990. Filed date 4 Apr 1990. USA Patent patent application 7-504,223. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE92003840. Source: OSTI; NTIS; GPO Dep.

This document describes a method for converting starch into lactic acid of sufficient purity for use as a substrate for biodegradable plastics. The process is designed to work on industrial food waste streams such as potato wastes or cheese whey permeate. For potato waste, α-amylase and calcium chloride are added to the starch containing waste and incubated at a pH of 4–7, a temperature of 90–130°C, and a pressure above 15 psi for not less than 15 minutes. At this point, glucoamylase is added and the mixture is incubated at a temperature of 50–70°C and a pH below 6.5 for 4 hours. This results in the conversion of more than 90% of the starch into glucose, which is substantially free of microbial contamination. The hydrolysate is filtered, and introduced with additional nutrients to a fermentor containing a lactose producing microorganism to form a fermentation broth. This results in the fermentation of glucose to lactose, which is filtered and subjected to electrodialysis for purification. Conversion of glucose to lactic acid or lactate occurs with an efficiency of over 95%. 1 fig. (MHB)

6503 (PNL–7830-Vol.2) **Development of an extruder-feeder biomass direct liquefaction process: Volume 2, Parts 4–8: Final report.** White, D.H. (Arizona Univ., Tucson, AZ (United States). Dept. of Chemical Engineering); Wolf, D. Pacific Northwest Lab., Richland, WA (United States); Arizona Univ., Tucson, AZ (United States). Dept. of Chemical Engineering. Oct 1991. 244p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC06-76RL01830. Order Number DE92003844. Source: OSTI; NTIS; GPO Dep.

As an abundant, renewable, domestic energy resource, biomass could help the United States reduce its dependence on imported oil. Biomass is the only renewable energy technology capable of addressing the national need for liquid transportation fuels. Thus, there is an incentive to develop economic conversion processes for converting biomass, including wood, into liquid fuels. Through research sponsored by the US DOE's Biomass Thermochemical Conversion Program, the University of Arizona has developed a unique biomass direct liquefaction system. The system features a modified single-screw extruder capable of pumping solid slurries containing as high as 60 wt% wood flour in wood oil derived vacuum bottoms at pressures up to 3000 psi. The extruder-feeder has been integrated with a unique reactor by the University to form a system which offers potential for improving high pressure biomass direct liquefaction technology. The extruder-feeder acts simultaneously as both a feed preheater and a pumping device for injecting wood slurries into a high pressure reactor in the biomass liquefaction process. An experimental facility was constructed and following shakedown operations, wood crude oil was produced by mid-1985. By July 1988, a total of 57 experimental continuous biomass liquefaction runs were made using White Birch wood feedstock. Good operability was achieved at slurry feed rates up to 30 lb/hr, reactor pressures from 800 to 3000 psi and temperatures from 350°C to 430°C under conditions covering a range of carbon monoxide feed rates and sodium carbonate catalyst addition. Crude wood oils containing as little as 6–10 wt% residual oxygen were produced. 38 refs., 82 figs., 26 tabs.

6504 **Apparatus for continuously producing sawdust charcoal.** Suzuki, K. 9 Aug 1991. Filed date 9 Feb 1990. Canada Patent patent application 2009666. 12p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

An apparatus is provided for producing sawdust charcoal, in which cylindrical sawdust charcoal is produced from Ogalite, a solid fuel obtained by heating and compressing sawdust into a cylindrical shape. The apparatus comprises a heating cylinder provided with vent holes for heating the Ogalites, means for transferring the Ogalites within the heating cylinder at a predetermined speed, and a combustion kiln for burning gases exhausted through the vent holes to heat the heating cylinder. The heating cylinder may have a sectional shape such that a plurality of cylindrical Ogalites can be simultaneously inserted. Upon heating in this apparatus, the Ogalites are exothermically decomposed to be carbonized under reducing conditions. In a preferred embodiment, the transferring means consists of a feed screw with a drive motor which operates at such a speed that the Ogalites reside in the heating cylinder for about 30 minutes. The cylinder is provided with an ash hopper for stocking ashes at an end of the cylinder in order to prevent air from flowing into the cylinder. The sawdust charcoals produced in the apparatus of the invention are uniform in shape and quality, and are easily handled for transportation and storage. 2 figs.

6505 (ORNL/TM–11851) **Technoeconomic evaluation of the extractive fermentation of butanol as a guide to research in this area of biotechnology.** Busche, R.M. (Bio En-Gene-Er Associates, Inc., Wilmington, DE (United States)). Oak Ridge National Lab., TN (United States). Sep 1991. 292p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE92004588. Source: OSTI; NTIS; GPO Dep.

This report represents the completion of a part of an overall project to evaluate the technical and economic status of several newly conceptualized processes for producing butanol, acetone, acetic acid, and aerobically produced specialty chemicals, which are candidates for research support. The objective of the project are to identify strengths and weaknesses in the proposed and to assist in developing an ongoing research strategy along economically relevant lines. The products to be studied presently comprise a collective US market for 10.7 billion lb valued at $2.8 billion. If their manufacturing processes were converted from petroleum feedstocks to corn, they could consume 556 million bushels. Furthermore, if ethanol could be produced at a low enough price to serve as the precursor to ethylene and butadiene, it an its derivatives could account for 159 billion lb, or 50% of the US production of 316 billion lb of synthetic organic chemicals, presently valued at $113 billion. This use would consume 3.4 billion bushels, or ~45% of the corn crop. In addition, the use of butanol for diesel blends or in jet fuel blends to enhance the range of military aircraft could further increase its market.

6506 (CONF-9106303–, pp. 109-110) **A novel process for methanol synthesis.** Tierney, J.W. (Univ. of Pittsburgh, PA (United States)); Wender, I. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89786. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

A novel slurry phase synthesis of methanol under mild conditions of 110-150C and 40-65 atm is being investigated. The synthesis involves the carbonylation of a molecule of methanol to methyl formate predominantly in the liquid phase followed by the heterogeneous hydrogenolysis of methyl formate to two molecules of methanol; the net result is the reaction of H_2 with CO to give methanol. A number of catalyst systems have been found to be active; a mixed catalyst comprised of KOMe/Cu-chromite was the most active. The system tolerates small amounts of CO_2 and H_2O and can give up to 90% conversion with 95% selectivity to methanol. The nature of the catalyst and the reactions involved, possible effects of alkali loading, interaction between catalysts and different species will be discussed.

13 HYDRO ENERGY

6507 (DOE/ID–10237(90-91)) **DOE Hydropower Program biennial report 1990–1991 (with updated annotated bibliography).** Chappell, J.R. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Rinehart, B.N.; Sommers, G.L.; Sale, M.J. Department of Energy, Idaho Falls, ID (United States). Idaho Operations Office. 6508 (DOE/BP/39339–5) **Assessment of the fishery improvement opportunities on the Pend Oreille River: Appendices: Annual report, 1990.** Ashe, B.L.; Lillengreen, K.L.; Vella, J.J.; Clark, L.O.; Nenema, G.J. Jr.; Richards, D.L.; Skillingstad, T.H.; Scholz, A.T. Eastern Washington Univ., Cheney, WA (United States). Upper Columbia United Tribes Fisheries Center. Mar 1991. 338p. Sponsored by U.S. DOE Bonneville Power Administration. DOE Contract BI79-88BP39339. Order Number DE92005362. Source: OSTI; NTIS; GPO Dep.

This report is a compilation of the seven appendices to DOE/BP/39339–4 the annual report for FY 1990. These appendices contain the supporting numerical data for the study. The purpose of this study was to assess the fishery improvement opportunities on the Box Canyon portion of the Pend Oreilla River. This three year study was initiated as part of the Northwest Power Planning Council's 1987 Columbia River Basin Fish and Wildlife Program. This report contains the findings of the third and final year of the study. The objectives of the third year of the study were to determine the relative abundance of each species in the river and sloughs; the population levels in five selected tributaries and, if possible, for fish in the river and sloughs; each species growth rate, feeding habits, abundance of preferred prey, and migration patterns; and the seasonal movement patterns and habitat utilization of largemouth bass.

6509 (DOE/BP/63584–5, pp. 6-44) **Life history and population dynamics of subadult and adult white sturgeon in the Columbia River between Bonneville and McNary dams.** Oregon Dept. of Fish and Wildlife, Portland, OR (United States). Sep 1991. Sponsored by U.S. DOE Bonneville Power Administration. In *Status and habitat requirements of the white sturgeon populations in the Columbia River downstream from McNary Dam: Annual progress report, April 1990–March 1991.* 180p. Order Number DE92005343. Source: OSTI; NTIS.

We report on our effort from April 1990 to March 1991 to describe the life history and population dynamics of white sturgeon Acipenser transmontanus in John Day Reservoir. We set 1,188 set lines and 26 gill nets. We caught 623 white sturgeon with set lines an 236 with gill nets. Catch per unit effort was much higher in areas near the tailrace than in downstream sites. Our setlines were size selective. We recaptured 3 fish released in John Day Reservoir in 1989 and 28 fish released in 1990. Sport and commercial fishermen recovered 62 tags from fish we tagged in Bonneville, The Dalles and John Day reservoirs, 1987–1990. We observed extensive movements of marked sturgeon within the reservoirs. We completed aging of available samples from all three reservoirs from 1987–1990. We aged fish as old as 46 years. Bone marks were observed on 74 of 78 fish previously injected with oxytetracycline and annulus formation was generally complete after June. We estimated parameters in a length-weight equation. About 1.5% of the female white sturgeon we examined to date had early or late vitellogenic eggs and would be expected to spawn the following year. 5 refs., 4 figs., 24 tabs.

6510 (DOE/BP/63584–5, pp. 45-81) **Reproduction and early life history characteristics of white sturgeon populations in Columbia River downstream from Bonneville Dam.** Oregon Dept. of Fish and Wildlife, Portland, OR (United States). Sep 1991. Sponsored by U.S. DOE Bonneville Power Administration. In *Status and habitat requirements of the white sturgeon populations in the Columbia River downstream from McNary Dam: Annual progress report, April 1990–March 1991.* 180p. Order Number DE92005343. Source: OSTI; NTIS.

The Washington Department of fisheries (WDF) censused the recreational fisheries in Bonneville and John Day reservoirs for mark recovery, biological samples and harvest data on white sturgeon (Acipenser transmontanus). Samplers interviewed 4,854 anglers in Bonneville Reservoir from March through October 1990 and 4, 952 anglers in John Day Reservoir from March through October 1990. Harvest estimates of legal size white sturgeon for these time periods were 2,114 in Bonneville Reservoir and 316 in John Day reservoir. Biological sampling was conducted on 12% of the Bonneville Reservoir sturgeon harvest and 16% of the sturgeon harvest in John Day reservoir during respective census periods. Treaty commercial fishery landings were sampled for harvest, mark and biological information on white sturgeon. WDF assisted the National Marine Fisheries Services in assessing reproduction and early life history of white sturgeon downstream from Bonneville Dam. WDF processed and staged samples of eggs and larvae collected in 1990. Population dynamics modeling o white sturgeon downstream from Bonneville Dam in 1990 included refinement of abundance and exploitation estimates and reproductive parameters. A total of 3,364 white sturgeon were tagged. Age validation techniques were furthered by injecting OTC and secondarily marking 962 white sturgeon. There were 14 recoveries of OTC-injected sturgeon from 1989 tagging efforts. Fecundity, age and other biological parameters were gathered on oversized sturgeon (>183 cm TL) by monitoring wild broodstock capture activities by Oregon private aquaculturists in 1990. Data were collected on 36 sturgeon including 24 that were oversized. 8 refs., 8 figs., 13 tabs.

6511 (DOE/BP/63584–5, pp. 82-144) **Habitat requirements for spawning and rearing of white sturgeon and quantify the extent of habitat available in the Columbia River between Bonneville and McNary dams.** Oregon Dept. of Fish and Wildlife, Portland, OR (United States). Sep 1991. Sponsored by U.S. DOE Bonneville Power Administration. In *Status and habitat requirements of the white sturgeon populations in the Columbia River downstream from McNary Dam: Annual progress report, April 1990–March 1991.* 180p. Order Number DE92005343. Source: OSTI; NTIS.

The US Fish and Wildlife Service (FWS) sampled white sturgeon (Acipenser transmontanus) eggs, larvae, and juveniles in the three Columbia River pools between Bonneville (RM 146.5) and McNary (RM 292. 0) dams from April through October, 1990. White sturgeon spawned in the tailrace areas in each pool at water temperatures of 12.9 to 17. 9°C, and mean water column velocities of 0.4 to 2.3 m per second. Based on back-calculated egg age, white sturgeon spawning occurred from 23 May to 7 July in Bonneville Pool, from 4 June to 2 July in The Dalles Pool, and from 27 May to 12 June in John Day Pool. Seven-hundred and sixty-eight white sturgeon eggs were collected in Bonneville Pool, compared with 337 in the Dalles Pool, and 71 in John Day Pool. Twenty-one percent of the eggs collected in Bonneville Pool were non-viable (dead or fungused) compared with 57% in The Dalles Pool, and 7% in John Day Pool. Three to four times as many larval white sturgeon were collected in bonneville Pool (221) than in The Dalles Pool (66) or John Day Pool (80). Young-of-the-year (YOY) white sturgeon collected in Bonneville Pool accounted for nearly 95% of the 1990 total annual catch of YOY from all three pools combined. Young- of-the-year white sturgeon were collected in all pools at 19.5 to 48. 8 m depths, over sand, mud, gravel, and cobble substrates. For the first time in this study, which began in 1987, YOY white sturgeon were collected in the Dalles Pool. Five YOY were collected in The Dalles Pool, while no YOY were collected in John Day Pool. Nearly 92% of all juvenile white sturgeon collected were caught in Bonneville Pool; juvenile catch per hectare was substantially higher in Bonneville Pool (3.84) than in the Dalles (0.92) and John Day pools (0.16). Juvenile white sturgeon were collected from water depths ranging from 9.1 to 36.0 m over substrates ranging from silt to cobble. 19 refs., 12 figs., 2 tabs.

6512 (DOE/BP/63584–5, pp. 145-180) **Habitat requirements for spawning and rearing of white sturgeon and quantification of extent rearing of habitat available in the Columbia River downstream from Bonneville Dam.** Oregon Dept. of Fish and Wildlife, Portland, OR (United States). Sep 1991. Sponsored by U.S. DOE Bonneville Power Administration. In *Status and habitat requirements of the white sturgeon populations in the Columbia River downstream from McNary Dam: Annual progress report, April 1990–March 1991.* 180p. Order Number DE92005343. Source: OSTI; NTIS.

During 1990, the National Marine Fisheries Service (NMFS) sampled white sturgeon Acipenser transmontanus eggs, larvae and juveniles in the Columbia River downstream from Bonneville Dam (River Mile (RM) 145). In conjunction with the Washington Department of Fisheries, 2,785 white sturgeon eggs were collected with plankton nets and artificial substrates between RMs 120 and 145; virtually all the eggs were collected within 6 miles of Bonneville Dam. In 1990, a total of 1,409 juvenile white sturgeon were collected with trawls, primarily a 7.9-m (headrope length) semiballoon shrimp trawl, in the Columbia River downstream from Bonneville Dam. Distributions of juvenile sturgeon were patchy; not only were there differences in catches among different areas of the river, but also differences in catches among parallel transects within the same area. The mean density of juvenile white sturgeon was highest at water depths (maximum) $\geq$18.3 m (45 ± 126 (mean ± SD) sturgeon/hectare) and lowest and depths $<$9.1 m (1 ± 3 sturgeon/hectare). In 1990, a total of 273 young-of-the-year white sturgeon were collected between RMs 28 and 131. Young-of-the-year preferred deeper areas of the river (mean minimum and maximum depths were 12.5 and 21.1 m, respectively). Since the white sturgeon is a demersal species and eats benthic invertebrates, four benthic surveys were conducted at RMs 95 and 131–132 in conjunction with the juvenile sampling to provide information on interannual variability of invertebrate populations. In addition, benthic samples were collected at six newly established shallow-water stations at RMs 95 and 131–132 to determine if densities of benthic invertebrates, particularly Corophium salmonis (an important prey for juvenile sturgeon), were high in these areas. Densities of C. salmonis in shallow water at RM 95 frequently exceeded 1,200 organisms/m^2, whereas in shallow water at RM 131–132, densities generally did not exceed 76 organisms/m^2.

1307 Power-Conversion Systems

6513 **From the power of water comes energies.** Sheu, B.; Sheu, T.; Sheu, S. 5 Aug 1991. Filed date 5 Feb 1990. Canada Patent patent application 2009261. 14p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

Arrangements are provided to convert hydraulic water power to intense air flows which are then used to power air turbines for electricity generation. In one embodiment, water from a nozzle enters a chamber through a cylinder where the water extracts a great volume of air at a very high speed, thus producing a jet of air in an outlet pipe which drives the air turbine. The chamber also has a means to regulate the flow of water from the water outlet control valve. In another embodiment, water is fed through a spiral orifice that has a counterclockwise spiral spring attached on its pipe shaft. The water coming out of the orifice has a high speed of orbital angular momentum with a strong vacuum power which is used to drive the air turbine located in front of the orifice opening. A cylinder enclosing the turbine provides a means by which to direct the flow of water and to recover more energy from the orifice. 4 figs.

The anisotropic factors of quasi-3-dimensionally modelled areas in the Alps - extent of the areas about (60x60) km^2 - are calculated for two wavelengths in the solar spectral region. For small snow cover absorptance and radiation budget are fairly approximated using simple assumptions for the reflectance function of the areas' elements. When the snow cover is increased large errors can arise, however, if reflectance anisotropy of the snow fields is not considered adequately. Actually, with METEOSAT measurements anisotropic factors f are needed that take this effect into consideration. In contrast, fairly accurate absorptances already are obtained with NOAA-AVHRR data and the assumption f=1 if evaluations are restricted to midday overpasses and positions of the area in the region of nadir ± 273 km. (orig.) With 16 figs., 3 tabs., 20 refs.

This paper describes the status and outlook of different solar photovoltaic power generation technologies and resources. Technical characteristics of solar photovoltaic systems are discussed. Also treated are environmental impacts and costs of solar photovoltaic generating technology which are expected to be available between now and the year 2020. Some institutional and other barriers are pointed out which might delay the deployment of solar photovoltaic power generating systems. Finally, recommendations of technology development priorities and the need and opportunities for international cooperation is stressed. (author). 26 refs, 2 figs, 3 tabs.

6516 (NREL/TP–214-4569) **Photovoltaic manufacturing technology, Phase 1: Final subcontract report, 9 January 1991–14 April 1991.** Albright, S. (Photon Energy, Inc., El Paso, TX (United States)). This report summarizes the analysis of photovoltaic module manufacturing done by Photon Energy, Inc. Photon Energy's four-stage expansion plan for photovoltaic module manufacturing is explained. Explored and studied were the following: current capabilities in manufacturing and process development, potential for increasing production and reducing manufacturing costs, problems likely to impede increased production and reduced manufacturing costs, and costs and other requirements involved in overcoming problems in manufacturing technology.

6517 (SAND–91-2408C) **Photovoltaics as a worldwide energy option: A case study in development strategy.** Jones, G.; Pate, R.; Hill, R. Sandia National Labs., Albuquerque, NM (United States). [1991]. 14p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. (CONF-9110299–1: 1991 Asia energy conference, Bangkok (Thailand), 17-20 Oct 1991). Order Number DE92004733. Source: OSTI; NTIS; INIS; GPO Dep.

Renewable energy technologies, such as solar thermal electric, photovoltaics (PV), and wind energy have made significant gains in cost and performance in the past decades. As a result, there have been high expectations on the part of the public for these sources to play a major role in future energy supply, especially as environmental concerns about conventional sources increase. Despite these past gains and high expectations, the global potential of renewable energy technologies still remains largely untapped, principally because of issues of industrialization and user acceptance. There is increasing recognition that government energy programs must incorporate a broader strategy than the traditional basic research role if they are to address these issues. Essential elements of this strategy are affordable technology, a healthy industry, sustained market growth, user acceptance, and equitable policy and financial environments. The US Department of Energy (DOE) programs in solar electric conversion have already started the development of the required broader-based effort. This paper presents the status of that work, utilizing the US National Photovoltaic Program as a case study.

6518 (SAND–91-2599C) **Photovoltaics as a worldwide energy source.** Jones, G.J. Sandia National Labs., Albuquerque, NM (United States). [1991]. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. (CONF-920227–1: 6. international photovoltaic science and engineering conference, New Delhi (India), 10-14 Feb 1992). Order Number DE92004735. Source: OSTI; NTIS; INIS; GPO Dep.

Photovoltaic energy systems have historically been treated as a bulk power generation source for the future. However, utilities and other agencies involved with electrification throughout the world are beginning to find photovoltaics a least-cost option to meet specific loads both for themselves and their customers, in both off-grid and grid-connected applications. These expanding markets offer the potential of hundreds of megawatts of sales in the coming decade, but a strategy addressing both industrial growth and user acceptance is necessary to capitalize on this opportunity. 11 refs.

6519 (SAND–91-7014) **Barriers to commercialization of large-scale solar electricity: Lessions learned from the LUZ experience.** Lotker, M. (Lotker (Michael), Westlake Village, CA (United States)). Sandia National Labs., Albuquerque, NM (United States). Nov 1991. 47p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. Order Number DE92004851. Source: OSTI; NTIS; GPO Dep.

This report discusses the economic and policy factors leading to the initial successful introduction of Luz International Limited's Solar Electric Generating Systems (SEGS). It then addresses the wide range of barriers to continued SEGS commercialization, including state and federal tax policy, avoided cost energy pricing, artificial size limitations under the Public Utility Regulatory Policies Act (PURPA), the loss of effectiveness of PURPA itself, the lack of incentives available to utilities as owners of solar electric plants, and the limited ways in which the environmental benefits of this technology have been recognized. The way in which each of these barriers contributed to the suspension of new LUZ projects is highlighted. In addition, mitigation approaches to each of these barriers are suggested.

The polycrystalline nature of thin-film CdTe and CuInSe$_2$ solar cells continues to be a major factor in several individual losses that limit overall cell efficiency. This report describes progress in the quantitative separation of these losses, including both measurement and analysis procedures. It also applies these techniques to several individual cells to help document the overall progress with CdTe and CuInSe$_2$ cells. Notably, CdTe cells from Photon Energy have reduced window photocurrent losses to 1 mA/Cm^2; those from the University of South Florida have achieved a maximum power voltage of 693 mV; and CuInSe$_2$ cells from International Solar Electric Technology have shown a hole density as high as 7×10^{16} cm^{-3}, implying a significant reduction in compensation. 9 refs.

Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE92001152. Source: OSTI; NTIS; GPO Dep.

This report describes existing integrated processes for solar cell manufacturing and lists as the primary opportunity for improvement the following areas: low-cost silicon sheets with improved characteristics; improved large-scale and automated solar cell processes that can lead to cell efficiencies in the range of 14% (encapsulated) for direct-cast wafers; improved handling and lamination of large-area modules for the emerging utility market. The proposed solutions can lead to finished module costs on the order of $1.55 per square meter or a selling price of less than $2.00/Watt. The problems that may be considered generic to the industry and that have been addressed in this work are as follows: gettering and passivation of silicon wafers; spray-on passivation layers; dual antireflection coatings; ink-jet printing of metallizations; and automated handling of large-area modules and associated vertical lamination. 14 refs.

6523 (NREL/TP–214-4489) **Photovoltaic manufacturing technology, Phase 1: Final subcontract report, 9 January 1991–14 April 1991.** Brown, S. (Glasstech Solar, Inc., Golden, CO (United States)); Shen, D.S.; Heeke, N. National Renewable Energy Lab., Golden, CO (United States); Glasstech Solar, Inc., Golden, CO (United States). Nov 1991. 61p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE91015025. Source: OSTI; NTIS; GPO Dep.

This report describes the Glasstech Solar design concepts for improved thin-film module production, including three process steps: (1) The front-end step includes washing, transparent conductive oxide (TCO) deposition, and patterning. (2) The P-I-N-M step is that in which the photovoltaic cell structure is deposited, including the back contact, without breaking vacuum. (3) The back end step includes masking, etching, washing, subcell testing and repair, interconnection, and encapsulation. The design is flexible and can be configured to a variety of applications. The front and back sections (steps 1 and 3) include a number of rotate modules and spacer conveyors. These modules and conveyors enable the line to hold and release glass panels according to the requirements of the process stations. 2 refs., 13 figs.

(Alpha Solarco, Inc., Cincinnati, OH (United States)). National Renewable Energy Lab., Golden, CO (United States); Alpha Solarco, Inc., Cincinnati, OH (United States). Nov 1991. 31p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE91015029. Source: OSTI; NTIS; GPO Dep.

This report describes the overall procedure involved in the manufacture of photovoltaic cells and modules; identified and describes potential cell and module manufacturing processes that can lead to improved performance, reduced manufacturing costs and significantly increased production, and notes the long-range potential benefits of these improvements; identifies and describes any problems that may impede the achievement of the long-range benefits; and identifies and describes the approaches for solving the identified implementation problems, including time and cost estimates.

6525 (NREL/TP–214-4502) **Polycrystalline thin film materials and devices: Annual subcontract report, 16 January 1990–15 January 1991.** Baron, B.N. (Delaware Univ., Newark, DE (United States). Inst. of Energy Conversion); Birkmire, R.W.; Phillips, J.E.; Shafarman, W.N.; Hegedus, S.S.; McCandless, B.E. National Renewable Energy Lab., Golden, CO (United States); Delaware Univ., Newark, DE (United States). Inst. of Energy Conversion. Nov 1991. 65p. Sponsored by U.S. DOE Conservation &

Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE92001171. Source: OSTI; NTIS; GPO Dep.

Results and conclusion of Phase I of a multi-year research program on polycrystalline thin film solar cells are presented. The research comprised investigation of the relationships among processing, materials properties and device performance of both $CuInSe_2$ and CdTe solar cells. The kinetics of the formation of $CuInSe_2$ by selenization with hydrogen selenide was investigated and a $CuInSe_2$/CdS solar cell was fabricated. An alternative process involving the reaction of deposited copper-indium-selenium layers was used to obtain single phase $CuInSe_2$ films and a cell efficiency of 7%. Detailed investigations of the open circuit voltage of $CuInSe_2$ solar cells showed that a simple Shockley-Read-Hall recombination mechanism can not account for the limitations in open circuit voltage. Examination of the influence of $CuInSe_2$ thickness on cell performance indicated that the back contact behavior has a significant effect when the $CuInSe_2$ is less than 1 micron thick. CdTe/CdS solar cells with efficiencies approaching 10% can be repeatedly fabricated using physical vapor deposition and serial post deposition processing. The absence of moisture during post deposition was found to be critical. Improvements in short circuit current of CdTe solar cells to levels approaching 25 mA/cm^2 are achievable by making the CdS window layer thinner. Further reductions in the CdS window layer thickness are presently limited by interdiffusion between the CdS and the CdTe. CdTe/CdS cells stored without protection from the atmosphere were found to degrade. The degradation was attributed to the metal contact. CdTe cells with ZnTe:Cu contacts to the CdTe were found to be more stable than cells with metal contacts. Analysis of current-voltage and spectral response of CdTe/CdS cells indicates the cell operates as a p-n heterojunction with the diode current dominated by SRH recombination in the junction region of the CdTe.

6526 (NREL/TP-214-4503) **The effectiveness and stability of impurity/defect interactions and their impact on minority carrier lifetime: Annual subcontract report, 1 August 1990–31 July 1991.** Rozgonyi, G.A. (North Carolina State Univ., Raleigh, NC (United States)); Shimura, F.; Buczkowski, A.; Zhon, T.Q. National Renewable Energy Lab., Golden, CO (United States); North Carolina State Univ., Raleigh, NC (United States). Dec 1991. 58p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE92001172. Source: OSTI; NTIS; GPO Dep.

This report covers the investigation and understanding of electrical activity of "clean" and metallic impurity decorated defects. A heterostructure containing a controlled number of deliberately introduced misfit dislocations is used as a model system to simulate a variety of defect/impurity interactions in photovoltaic materials. In addition, a noncontact laser/microwave deep-level transient spectroscopy technique is applied to characterize the minority carrier lifetime and determine the energy levels of defects. 59 refs.

6527 (NREL/TP-214-4610) **Polycrystalline thin-film solar cells and modules.** Ullal, H.S.; Stone, J.L.; Zweibel, K.; Surek, T.; Mitchell, R.L. National Renewable Energy Lab., Golden, CO (United States). Dec 1991. 7p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. (CONF-920227-3: 6. international photovoltaic science and engineering conference, New Delhi (India), 10-14 Feb 1992). Order Number DE92001196. Source: OSTI; NTIS; GPO Dep.

This paper describes the recent technological advances in polycrystalline thin-film solar cells and modules. Three thin film materials, namely, cadmium telluride (CdTe), copper indium diselenide ($CuInSe_2$, CIS) and silicon films (Si-films) have made substantial technical progress, both in device and module performance. Early stability results for modules tested outdoors by various groups worldwide are also encouraging. The major global players actively involved in the development of the these technologies are discussed. Technical issues related to these materials are elucidated. Three 20-kW polycrystalline thin-film demonstration photovoltaic (PV) systems are expected to be installed in Davis, CA in 1992 as part of the Photovoltaics for Utility-Scale Applications (PVUSA) project. This is a joint project between the US Department of Energy (DOE), Pacific Gas and Electric (PG&E), Electric Power Research Institute (EPRI), California Energy Commission (CEC), and a utility consortium.

6528 **Method of making semiconductor junctions.** James, R.B. To Dept. of Energy. 1990. Filed date 13 Jun 1990. USA Patent patent application 7-537,957. 28p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DR00789. Order Number DE92003686. Source: OSTI; NTIS; GPO Dep.

A p-n junction on a silicon substrate doped with boron ions (d-dopant) is made in following manner. A shallow silicon surface layer including a n-type dopant is first obtained by ion implantation of the substrate with arsenic atoms. The arsenic-doped silicon layer at the surface has a relatively low initial reflectivity. Then, radiation from a pulsed carbon dioxide laser is directed onto the doped surface. A portion of the pulsed radiation causes melting of the thin arsenic-doped layer at the solid surface, giving the shallow melted surface a reflectivity greater than the initial reflectivity of the solid surface. The increased reflectivity of the melted surface prevents an additional portion of the pulsed radiation from causing further melting, thus controlling the depth of melting. The melted surface is then allowed to cool and solidify to form a p-n junction at a thin (less than 200 angstrom) junction depth. 6 figs.

6529 (PTB-Opt-31) **The results of the PEP '87 round robin calibration of reference solar cells and modules. Final report.** Metzdorf, J.; Wittchen, T.; Heidler, K.; Dehne, K.; Shimokawa, R.; Nagamine, F.; Ossenbrink, H.; Fornarini, L.; Goodbody, C.; Davies, M.; Emery, K.; DeBlasio, R. Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Abt. Optik. Nov 1990. 164p. Order Number DE92758945. Source: OSTI; NTIS (US Sales Only).

Initiated by the Photovoltaic Solar Energy Project (PEP) of the Technology, Growth and Employment Working Group of the Summit, a second international intercomparison (PEP'87 Round-Robin Calibration) on the calibration of reference solar cells and PV modules was carried out from 1987 to 1989 where PTB and ISE (FRG) served as operating agents. This report documents the final results of this intercomparison. A summary of this report was presented at the 21st IEEE Photovoltaic Specialists Conference. The round robin was required for two reasons: First, the dispersion of the results (definition, see Section 1.4) of the eight participants of the first PEP Round Robin 1984/85 where greater than expected with 2 σ_{rel} values of 5.6% and 12.2% for crystalline and amorphous Si reference cells, respectively. Second, a comparative study of calibration methods and of reference cell design and technology is required for the standardization of calibration methods and reference devices desired by the International Electrotechnical Commission (IEC TC82). Also more experience in the calibration is needed. (orig.).

6530 (SAND-91-2515C) **Process development for high-efficiency silicon solar cells.** Gee, J.M.; Basore, P.A.; Buck, M.E.; Ruby, D.S.; Schubert, W.K.; Silva, B.L.; Tingley, J.W. Sandia National Labs., Albuquerque, NM (United States). [1991]. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. (CONF-920227-2: 6. international photovoltaic science and engineering conference, New Delhi (India), 10-14 Feb 1992). Order Number DE92004741. Source: OSTI; NTIS; GPO Dep.

Fabrication of high-efficiency silicon solar cells in an industrial environment requires a different optimization than in a laboratory environment. Strategies are presented for process development of high-efficiency silicon solar cells, with a goal of simplifying technology transfer into an industrial setting. The strategies emphasize the use of statistical experimental design for process optimization, and the use of baseline processes and cells for process monitoring and quality control. 8 refs.

6531 (SAND-91-7013) **Modelling and fabrication of high-efficiency silicon solar cells.** Rohatgi, A. (Georgia Inst. of Tech., Atlanta, GA (United States). School of Electrical Engineering); Smith, A.W.; Salami, J. Sandia National Labs., Albuquerque, NM (United States); Georgia Inst. of Tech., Atlanta, GA (United States). School of Electrical Engineering. Oct 1991. 176p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. Order Number DE92004781. Source: OSTI; NTIS; GPO Dep.

This report covers the research conducted on modelling and development of high-efficiency silicon solar cells during the period May 1989 to August 1990. First, considerable effort was devoted toward developing a ray-tracing program for the photovoltaic community to quantify and optimize surface texturing for solar cells. Second, attempts were made to develop a hydrodynamic model for device simulation. Such a model is somewhat slower than drift-diffusion type models like PC-1D, but it can account for more physical phenomena in the device, such as hot carrier effects, temperature gradients, thermal diffusion, and lattice heat flow. In addition, Fermi-Dirac statistics have been incorporated into the model to deal with heavy doping effects more accurately. Third and final component of the research includes development of silicon cell fabrication capabilities and fabrication of high-efficiency silicon cells. 84 refs., 46 figs., 10 tabs.

DOE Contract AC04-76DP00789. (CONF-911055–10: 22. IEEE photovoltaic specialists conference, Las Vegas, NV (United States), 7-11 Oct 1991). Order Number DE92004734. Source: OSTI; NTIS; INIS; GPO Dep.

Photovoltaic (PV) systems are increasing in popularity in the northern latitudes and in the arctic regions in the state of Alaska. This increased interest and the high cost of providing electric power in these remote areas have prompted the Alaska Energy Authority (AEA) to request assistance from the Photovoltaic Design Assistance Center at Sandia National Laboratories. A project to investigate the feasibility of using PV-Diesel hybrid power systems in small villages in Alaska was started in 1989. Data acquisition systems (DAS) were designed and installed in selected villages to obtain resource and load information. The DAS is described and village electrical and resource data are presented. Simulations were run using the collected village data and actual cost data provided by the AEA. Results of the simulations and the economic analysis are presented. 5 refs., 8 figs.

1407 Solar Thermal Power Systems

6533 (SAND–90-1162) **Characteristics, finite element analysis, test description, and preliminary test results of the STM4-120 kinematic Stirling engine.** Linker, K.L.; Rawlinson, K.S.; Smith, G. Sandia National Labs., Albuquerque, NM (United States). Oct 1991. 50p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. Order Number DE92004784. Source: OSTI; NTIS; GPO Dep.

The Department of Energy's Solar Thermal Program has as one of its program elements the development and evaluation of conversion device technologies applicable to dish-electric systems. The primary research and development combines a conversion device (heat engine), solar receiver, and generator mounted at the focus of a parabolic dish concentrator. The Stirling-cycle heat engine was identified as the conversion device for dish-electric with the most potential for meeting the program's goals for efficiency, reliability, and installed cost. To advance the technology toward commercialization, Sandia National Laboratories has acquired a Stirling Thermal Motors, Inc., kinematic Stirling engine, STM4-120, for evaluation. The engine is being bench-tested at Sandia's Engine Test Facility and will be combined later with a solar receiver for on-sun evaluation. This report presents the engine characteristics, finite element analyses of critical engine components, test system layout, instrumentation, and preliminary performance results from the bench test.

6534 (SAND–90-2624) **Static load testing of a heliostat drive.** Grossman, J.W. Sandia National Labs., Albuquerque, NM (United States). Oct 1991. 60p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. Order Number DE92003952. Source: OSTI; NTIS; GPO Dep.

The drive designed and built by the Solar Power Engineering Company (SPECO) for its large area heliostat failed under high wind loads during a winter storm. This report details the testing and analysis done to verify the load capabilities of the rebuilt heliostat drive. Changes in design and improvements in fabrication resulted in a usable drive. 12 figs., 7 tabs.

1408 Ocean Energy Systems

6535 (IAEA-TECDOC–624, pp. 267-274) **Ocean thermal energy conversion.** Cavanagh, J. (UKAEA Harwell Lab. (United Kingdom). Energy Technology Support Unit). International Atomic Energy Agency, Vienna (Austria). Sep 1991. (CONF-910506–: Senior expert symposium on electricity and the environment, Helsinki (Finland), 13-17 May 1991). In *Electricity and the environment: Background papers for a senior expert symposium held in Helsinki, 13-17 May 1991.* 600p. Order Number DE92607903. Source: OSTI; NTIS (US Sales Only); INIS.

Ocean Thermal Energy Conversion (OTEC) systems utilize the natural temperature difference that exists between the warm waters of the ocean surface and the colder waters of the deep ocean to drive a power plant. This temperature difference, caused by the heating effect of the sun, exists 24 hours a day allowing OTEC plants to operate continuously. It is generally considered that a temperature difference of the order of 20 deg. C would be required for the economic operation of an OTEC plant and this may be found in the tropical regions of the world. The principle of OTEC is simple, but the low thermal conversion efficiency when operating with such small temperature differences requires enormous flows of water for a reasonable power output and necessitates enormous components which tend to be expensive. The high capital cost of an OTEC plant suggests that the market will be greatest where its competition, electricity from fossil fuels, is most expensive; for example, island communities currently relying on imported oil. Although OTEC has been proven at the small scale and could be expected to operate at a larger one, there are few plants and OTEC seems unlikely to play anything more than a minor role as a generator of the world's electricity in the foreseeable future. It is primarily poor economics which militate against its exploitation as a renewable energy technology. (author). 4 refs, 3 figs.

1409 Solar Thermal Utilization

6536 (DOE/SF/16306–31) **Developing, testing, evaluating and optimizing solar heating and cooling systems: Status report, 1 September 1991–31 October 1991.** Colorado State Univ., Fort Collins, CO (United States). Solar Energy Applications Lab. Nov 1991. 25p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FG03-86SF16306. Order Number DE92004644. Source: OSTI; NTIS; GPO Dep.

The objective is to develop and test various integrated solar heating, cooling and domestic hot water systems, and to evaluate their performance. Systems composed of new, as well a previously tested, components are carefully integrated so that effects of new components on system performance can be clearly delineated. The SEAL-DOE program includes six tasks which have received funding for the 1991–1992 fifteen-month period. These include: (1) a project employing isothermal operation of air and liquid solar space hearing systems, (2) a project to build and test several generic solar water heaters, (3) a project that will evaluate advanced solar domestic hot water components and concepts and integrate them into solar domestic hot water systems, (4) a liquid desiccant cooling system development project, (5) a project that will perform system modeling and analysis work on solid desiccant cooling systems research, and (6) a management task. The objectives and progress in each task are described in this report. 6 figs., 2 tabs.

6537 (ETSU-S–1197F) **Heat transfer through doorways in passive solar buildings.** Martin, C.; Watson, M. AEA Environment and Energy, Harwell (United Kingdom); Energy Monitoring Co. Ltd., Newport Paynell (United Kingdom). Mar 1990. 114p. Order Number DE92750023. Source: OSTI; NTIS (US Sales Only).

The work described in this document set out to improve the confidence with which thermal simulation modellers can treat the flow of energy through the doorways which connect the zones of a passive solar building. The study began by reviewing the requirements of the three models currently under consideration in the Passive Solar Programme, and by examining the theoretical treatment which can be used to obtain the input information required by those models. The models which require the user to specify the heat flow through doorways (SERI-RES and HTB2) do not model the pressure differences between zones, and thus only the buoyancy driven flow through doorways has been considered. Furthermore, as these models are generally used to produce predictions only down to an hourly timescale, the dynamic effects which occur on much shorter timescales when doors are opened and closed were also not considered. (author).

1410 Solar Collectors and Concentrators

6538 (IC–90/328) **A study of the flat plate solar collector in Guinea.** Boye Barry, M. International Centre for Theoretical Physics, Trieste (Italy). Dec 1990. 15p. Order Number DE92613775. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper, we study a collector, made by cheap local materials (wood, aluminium, etc.), and prepared in the carpenteries, and in the mechanic work rooms with a simple technology. The efficiency of our collector is compared with several variants made in other countries. (author). 9 refs, 6 figs, 2 tabs.

6539 (NREL/TP–214-4486) **Photovoltaic Manufacturing Technology (PVMaT) improvements for ENTECH's concentrator module: Final technical report, 9 January 1991–14 April 1991.** O'Neill, M.J. (ENTECH, Inc., Dallas-Fort Worth Airport, TX (United States)); McDanal, A.J.; Perry, J.L.; Jackson, M.C.; Walters, R.R. National Renewable Energy Lab., Golden, CO (United States); ENTECH, Inc., Dallas-Fort Worth Airport, TX (United States). Nov 1991. 34p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE92001170. Source: OSTI; NTIS; GPO Dep.

This final technical report documents ENTECH's Phase 1 contract with Photovoltaic Manufacturing Technology (PVMaT) project. Under this project we prepared a detailed description of our current manufacturing process for making our unique linear Fresnel lens photovoltaic concentrator modules. In addition, we prepared a detailed description of an improved manufacturing process, which will simultaneously increase module production rates, enhance module quality, and substantially reduce module costs. We also identified potential problems in implementing the new manufacturing process, and we proposed solutions to these anticipated problems. Before discussing the key results of our program, however, we present a brief description of our unique photovoltaic technology. The key conclusion of our PVMAT Phase 1 study is that our module technology, without further breakthroughs, can realistically meet the near-term DOE goal of 12 cents/kWh levelized electricity cost, provided that we successfully implement the new manufacturing process at a production volume of at least 10 megawatts per year. The key recommendation from our Phase 1 study is to continue our PVMaT project into Phase 2A, which is directed toward the actual manufacturing technology development required for our new module production process. 15 refs.

6540 (SAND–91-7008) **Facet development for a faceted stretched-membrane dish by SAIC.** Sandia National Labs., Albuquerque, NM (United States); Science Applications International Corp., San Diego, CA (United States). Energy Projects Div. Oct 1991. 81p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. Order Number DE92004475. Source: OSTI; NTIS; GPO Dep.

The concept for a multi-facet stretched-membrane dish concentrator could reduce the cost and weight of solar thermal dish systems. A stretched-membrane mirror facet for such a multi-facet solar dish concentrator has been developed by Science Applications International Corporation (SAIC). Twelve of the 3.7-m diameter facets will be used to form a 115-m^2 dish concentrator, providing 75 kW$_{th}$ to operate a 25-kW$_e$ Stirling engine for electric power production. The facet SAIC designed is focused using a vacuum system to elastically deform the thin (0.003-inch thick) stainless steel facet membranes. Elastic focusing was chosen over plastically deforming the membrane to a parabolic shape because it results in a simple manufacturing process. The SAIC facet can be focused from infinity to a minimum focal length-to-diameter ratio of about 2.7. Analytical design studies and experimental tests were performed to evaluate stresses in the ring and membranes during operation, the effects of strain cycling on the reflective surface, and to measure the optical quality of the mirror facets. SAIC produced two prototype mirror facets and they were optically tested at the Solar Energy Research Institute and at Sandia National Laboratories. The first facet showed slope errors ranging from 2.95 to 3.3 mrad over the f/d range of 2.7 to 3.0.

15 GEOTHERMAL ENERGY

6541 (DOE/ID/12489–116) **[Geosciences research and development]: Final report, July 1, 1985–February 28, 1991.** Utah Univ. Research Inst., Salt Lake City, UT (United States). Earth Science Lab. Mar 1991. 117p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-85ID12489. (ESL–91001-FR). Order Number DE92004818. Source: OSTI; NTIS; GPO Dep.

This report represents the final report of the University of Utah Research Institute under US Department of Energy Contract No. DE-AC07-85ID12489. It consists of the abstracts and references of all technical reports generated by UURI under this contract. This report lists the abstracts in DOE report number sequence. The author index of this report will be useful in locating specific references. These reports are all related to earth science and geothermal energy.

6543 (LA-UR–91-1990) **Orientation of minimum principal stress in the hot dry rock geothermal reservoir at Fenton Hill, New Mexico.** Burns, K.L. Los Alamos National Lab., NM (United States). [1991]. 5p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-7405-ENG-36. (CONF-9110151–3: Geothermal Resources Council annual meeting and trade show, Reno, NV (United States), 6-9 Oct 1991). Order Number DE91014743. Source: OSTI; NTIS; GPO Dep.

The stress field at the source of microearthquakes in the interior of the hot dry rock geothermal reservoir at Fenton Hill appears to be different to the far field stress outside the reservoir. The stress field seems to be re-oriented prior to failure, during the course of processes that inflate the reservoir. The state of stress, both inside and outside, the hot dry rock (HDR) geothermal reservoir at Fenton Hill, is important in predicting the course of stress-dependent processes, and in transferring HDR technology developed at Fenton Hill, to sites, such as at Clearlake in California, where the stress field is expected to be substantially different. The state of stress at

Fenton Hill is not well known because of limitations in stress measuring technology. It is necessary to use a variety of indirect methods and seek an estimate of the stress. 5 refs.

6544 (SAND–91-1848C) **An evaluation of flowmeters for the detection of kicks and lost circulation during drilling.** Schafer, D.M. (Sandia National Labs., Albuquerque, NM (United States)); Loeppke, G.E.; Glowka, D.A.; Scott, D.D.; Wright, K.E. Sandia National Labs., Albuquerque, NM (United States). [1991]. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. (CONF-920250–1: 1992 Society of Petroleum Engineers (SPE) drilling conference, New Orleans, LA (United States), 18-21 Feb 1992). Order Number DE92004209. Source: OSTI; NTIS; GPO Dep.

An independent evaluation of current industry standard and state-of-the-art drilling fluid inflow and outflow meters was conducted during the drilling of a geothermal exploratory well. Four different types of fluid inflow meters and three different types of fluid outflow meters were tested and evaluated during actual drilling operations. The tested drilling fluid inflow meters included conventional pump stroke counters, rotary pump speed counters, magnetic flow meters, and a Doppler ultrasonic flow meter. On the return flow line, a standard paddle meter, an acoustic level meter, and a prototype rolling float meter were evaluated to measure drilling fluid outflow rates. The prototype outflow meter utilizes a rolling float which rides on the surface of the flow thereby measuring the fluid height in the pipe. Both the prototype meter and the conventional paddle meter were also extensively tested under a variety of drilling conditions in a full-scale laboratory test facility. The meters were evaluated and compared on the basis of reliability and accuracy, and the results are presented in the paper.

1510 Direct Energy Utilization

6545 (EGG-EP–9839) **The feasibility of applying geopressured-geothermal resources to direct uses.** Lunis, B.C. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Negus-de Wys, J.; Plum, M.M.; Lienau, P.J.; Spencer, F.J.; Nitschke, G.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1991. 130p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. Order Number DE92003361. Source: OSTI; NTIS; GPO Dep.

This study concludes that direct use technologies, especially desalinated water production, can contribute significantly to the value added process and the overall economic viability in developing a geopressured resource. Although agriculture and aquaculture applications are marginal projects when they are the only use of a geopressured well, the small margin of profitability can contribute to improving the overall economics of the direct use development. The added complexity from a technical and management aspect may add to the overall risk and unpredictability of the project. Six combination of direct uses received economic evaluation that resulted in 15% discounted payback periods ranging from 4 to over 10 years. Many other combinations are possible depending on the resource and market variables. Selection of appropriate technologies and sizes of applications will be established by the developer that engages in geopressured resource utilization. Currently, many areas of the country where geopressured resources are located also have surplus electrical capacity and generation, thus power utilities have been selling power for less than 2 cents per kWH, well below a reasonable breakeven value for geopressured produced electricity. However, when the energy demand of the integrated geopressured facility is large enough to install power generation equipment, operating expenses can be reduced by not paying the 10 to 12 cents per kWH utility rate. The study includes an analysis of a geothermal turbine unit installed with a desalination and an agriculture/aquaculture facility, taking advantage of the cascading energy values. Results suggest that this scenario becomes profitable only where the market price for electricity exceeds five cents per kWH.

16 TIDAL AND WAVE POWER

1604 Economic, Industrial, and Business Aspects

1605 Environmental Aspects

6546 (IAEA-TECDOC–624, pp. 275-291) **Tidal energy.** Cavanagh, J. (UKAEA Harwell Lab. (United Kingdom). Energy Technology Support Unit). International Atomic Energy Agency, Vienna (Austria). Sep 1991. (CONF-910506–: Senior expert symposium on electricity and the environment, Helsinki (Finland), 13-17 May 1991). In *Electricity and the environment: Background papers for a senior expert symposium held in Helsinki, 13-17 May 1991.* 600p. Order Number DE92607903. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes tidal energy systems as a technology for electricity generation. After a consideration of the nature of tides and the potential world tidal energy resource the paper describes the present status of the technology, the elements which make-up a tidal scheme and the proposed methods of operation and construction. The environmental implications of tidal schemes are dealt with. The final section considers the economics of tidal power with particular reference to the proposed Severn tidal barrage in the UK. (author). 3 refs, 5 figs, 5 tabs.

17 WIND ENERGY

1706 Wind Energy Engineering

6547 (NREL/TP–257-4510) **Dynamic stall on wind turbine blades.** Butterfield, C.P. (National Renewable Energy Lab., Golden, CO (United States)); Simms, D.; Scott, G.; Hansen, A.C. National Renewable Energy Lab., Golden, CO (United States). Dec 1991. 9p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. (CONF-9109112–7: 21. American Wind Energy Association conference: windpower '91, Palm Springs, CA (United States), 24-27 Sep 1991). Order Number DE92001157. Source: OSTI; NTIS; GPO Dep.

Dynamic loads must be predicted accurately in order to estimate the fatigue life of wind turbines operating in turbulent environments. Dynamic stall contributes to increased dynamic loads during normal operation of all types of horizontal-axis wind turbine (HAWTs). This report illustrates how dynamic stall varies throughout the blade span of a 10 m HAWT during yawed and unyawed operating conditions. Lift, drag, and pitching moment coefficients during dynamics stall are discussed. Resulting dynamic loads are presented, and the effects of dynamic stall on yaw loads are demonstrated using a yaw loads dynamic analysis (YAWDYN). 12 refs., 22 figs., 1 tab.

6548 (NREL/TP–257-4518) **An overview: Challenges in wind technology development.** Thresher, R.W.; Hock, S.M. National Renewable Energy Lab., Golden, CO (United States). Dec 1991. 10p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. (CONF-9109112–8: 21. American Wind Energy Association conference: windpower '91, Palm Springs, CA (United States), 24-27 Sep 1991). Order Number DE92001190. Source: OSTI; NTIS; GPO Dep.

Developing innovative wind turbine components and advanced turbine configurations is a primary focus for wind technology researchers. In their rush to bring these new components and systems to the marketplace, designers and developers should consider the lessons learned in the wind farms over the past 10 years.

Experience has shown that a disciplined design approach is required that realistically accounts for the turbulence-induced loads, unsteady stall loading, and fatigue effects. This paper reviews past experiences and compares current modelling capabilities with experimental measurements in order to identify some of the knowledge gaps that challenge designers of advanced components and systems. 7 refs., 11 figs.

6549 (NREL/TP-257-4625) **The Federal Advanced Wind Turbine Program.** Hock, S.M. (National Renewable Energy Lab., Golden, CO (United States)); Thresher, R.W.; Goldman, P.R. National Renewable Energy Lab., Golden, CO (United States). Dec 1991. 7p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. (CONF-9109112-6: 21. American Wind Energy Association conference: windpower '91, Palm Springs, CA (United States), 24-27 Sep 1991). Order Number DE92001189. Source: OSTI; NTIS; GPO Dep.

The development of technologically advanced, higher efficiency wind turbines has been identified as a high priority activity by the US wind industry. The Department of Energy's Wind Energy Program has begun a multi-year development program aimed at assisting the wind industry with the design, development, and testing of advanced wind turbine systems that can compete with conventional electric generation for $0.05/kWh at 13 mph sites by the mid-1990s and with fossil-fuel-based generators for $0.04/kWh at 13 mph sites by the year 2000. The development plan consists of four phases: (1) Conceptual Design Studies; (2) Near-Term Product Development; (3) Next Generation Technology Integration and Design, and (4) Next- Generation Technology Development and Testing. The Conceptual Design Studies were begun in late 1990, and are scheduled for completion in the Spring of 1992. Preliminary results from these analyses are very promising and indicate that the goals stated above are technically feasible. This paper includes a brief summary of the Conceptual Design Studies and presents initial plans for the follow-on activities. 3 refs., 4 figs.

6550 (SAND-91-2386C) **The status of the US VAWT program.** Dodd, H.M.; Berg, D.E.; Ashwill, T.D.; Sutherland, H.J.; Schluter, L.L. Sandia National Labs., Albuquerque, NM (United States). [1991]. 20p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. (CONF-9111131-1: Canadian Wind Energy Association (CWEA) meeting, Montreal (Canada), 4 Nov 1991). Order Number DE92002931. Source: OSTI; NTIS; GPO Dep.

Vertical axis wind turbine (VAWT) technology in the United States started in the early 1970s directly from the original work in Canada. The close, and very productive relationships among laboratories, universities and industry have continued since that time. This paper briefly discusses the significant technical progress and rather dramatic programmatic changes that have occurred in the past 18 to 24 months on the US side of the border. 20 refs., 14 figs.

6551 (CONF-910571-, pp. 23-52) **Advanced power systems fired with low rank coals.** Wolk, R.H. (Electric Power Research Inst., Palo Alto, CA (United States)); McDaniel, J.E.; Stewart, N.C. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

Even though there is a large and growing market for low rank coals, their high moisture content does increase shipping costs to power plants located near population centers. This provides a major opportunity for a lower moisture product which could reduce the delivered Btu cost to the consumer. Several projects have either recently begun operation or are under construction to provide such a product. Other new technologies have been developed to utilize low rank coals. Low rank coals fuel several fluidized bed combustion power plants. The Dakota Gasification, Inc. plant producing synthetic natural gas from lignite and Dow's IGCC plant generating electricity and steam from Wyoming subbituminous demonstrate the economic viability of this resource in more new technology applications. Low rank coals were also utilized in the early 1980s in large scale coal liquefaction demonstration facilities. More recently experimental programs have evaluated the hydrogenation of a mixture of low rank coals and residual oils. The approach appears to be economically promising. Other longer range approaches, including power plants based on combining coal gasification with molten carbonate fuel cells and MHD have been the subject of recent studies which indicate promising potential. This paper provides an overview of activities in these areas.

6552 (CONF-910571-, pp. 95-111) **Puentes Power Plant retrofitting: Use of Powder River Basin (P.R.B.) sub-bituminous coal.** Hidalgo, J.M. (Empresa Nacionale De Electricidad, S.A., Madrid (Spain)). North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The guidelines, concerning the reduction of pollutant emissions into the atmosphere, given by the regulating agencies of the European Economic Community, obligate Spain to make a global reduction in phases in 1993, 1998, and 2003. The Puentes Thermal Power Station, with 1,400 MW(e), which fires local low range and high sulfur content coal, has to reduce its emissions of SO_2 in half. Steam generators are prepared according to German technology to burn lignite and have undergone a series of modifications to improve their efficiency and availability. This paper deals with the feasibility studies carried out with different ecological fuels (bituminous coals, natural gas, subbituminous coals, and mixes). Having in mind technical, economic, environmental and strategic reasons, conversion to subbituminous coal has been selected on the basis of the existence of the P.R.B. coal as a source of supply. The laboratory tests as well as the pilot tests at the facilities have confirmed the feasibility of burning P.R.B. coal using European technology for low range coals. This paper also details the most important parameters in the milling and combustion of the P.R.B. following the technology which is being applied in the US and compares them with the ones obtainable with the Puentes Power Station conversion.

6553 (CONF-910571-, pp. 112-124) **Blending of eastern and western coal: Results of a test burn at Joppa Station.** Selle, S.J. (Northwest Research, Inc., Grand Forks, ND (United States)); Dorris, H.L.; Sobule, J.A. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

Electric Energy Inc., prompted by concerns over pending stack emission standards and future fuel costs, performed a test burn on Unit 5 at its Joppa Station during December 1989 and January 1990. A low-sulfur, low-ash Powder River Basin (PRB) subbituminous coal from the Caballo Rojo mine located in northeastern Wyoming was selected for the test burn. Unit 5 characteristics include closely-spaced convective tubes, a finned-tube economizer, compressed air soot blowers, lower pulverizer inlet air temperatures by subbituminous standards and a small electrostatic precipitator (ESP). The test burn had two main objectives: (1) to establish the viability of a blend containing 25 percent Caballo Rojo with their current fuels, and (2) to establish plant limitations at higher proportions of PRB coals up to 100 percent. Results at the 25/75, Caballo Rojo/Sahara, blend ratio showed that this blend could be utilized at Joppa while maintaining full load with a spare pulverizer and with no reduction in ESP effectiveness. No load reduction was necessary at a 50/50 blend ratio and a spare mill was still available, however, ESP performance declined. A 75/25 ratio required the use of all pulverizers, resulted in a 6 percent load reduction due to ID fan capacity and caused a further deterioration in ESP performance. ESP effectiveness returned to its original level at 100 percent Caballo Rojo, but a 14 percent load reduction was required.

6554 (CONF-910571–, pp. 256-270) **Alternative technologies for the generation of electricity from Victorian brown coal.** Anderson, B. (State Electricity Commission of Victoria, Richmond (Australia)); Johnson, T. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The State Electricity Commission of Victoria is conducting a program of research and development into alternatives to the use of conventional boilers for the generation of electricity from brown coal. The objective of the program is to reduce the cost of electricity and also to improve the thermal efficiency so as to reduce the emission of greenhouse gases. The program presently includes the following four technologies: Hydro-thermal Drying, Direct Coal Fired Gas Turbine, Integrated Gasification Combined Cycle, and Steam Fluidized Bed Drying. This paper concentrates on the first two projects. The Coal Fired Gas Turbine (CFGT) is being pursued because it offers the possibility of cheap electricity at relatively high efficiency when combined with a steam bottoming cycle. The Hydro-thermal drying (HTD) process is being developed to provide a coal-water-slurry fuel for the CFGT. Victorian brown coal is a good candidate for this application because of its low ash and sulphur content. The HTD process produces a combustible slurry containing a minimum of sodium and it also facilitates the addition of water-soluble additives to control ash fouling and corrosion. Following the successful testing of a sample of Victorian brown coal in the Hot Water Drying Process Development Unit and Turbine Simulator at the Energy and Environmental Research Center, Grand Forks, it was decided to construct an HTD Pilot Plant and a Turbine Simulator at the Herman Research Laboratory. Details of the plant and some results from the preliminary tests are given in the paper.

6555 (CONF-910571–, pp. 285-300) **BHEL's moving bed gasification technology for IGCC application.** Sridhar, S. (Bharat Heavy Electricals Ltd., Hyderabad (India)); Krishnamoorthy, S.; Bheemaiah, P.; Duraikannu, M.; Ramani, N.V.S. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS, INIS.

Bharat Heavy Electricals Ltd. (BHEL) has developed a technology for efficient utilization of low grade, high ash coals to introduce efficient energy conversion systems into the Indian power scene to conserve fuel. The details of the moving bed coal gasification technology developed for the Combined Cycle Demonstration Plant (CCDP) and its performance are outlined in this paper. This paper describes the combined cycle concept, ignition by steam activation, control systems and instrumentation, the heat recovery system, plant performance, and a mathematical model.

6556 (CONF-910571–, pp. 378-391) **Coal-fired magnetohydrodynamic power generation status and demonstration designs.** Walter, F. (Montana Power Co., Butte (United States)); Sherick, J.; Labrie, R.J. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

Magnetohydrodynamics (MHD) is a direct coal-burning, high-efficiency, advanced fossil fuel technology that is environmentally acceptable for generating electric power. The development of MHD technology has advanced to where it can be demonstrated at the 250-megawatt thermal (MWt) level around the year 2000. The operational data from the MHD test facilities have verified MHD's potential and are summarized in the text. Of particular significance are: the sulfur oxides (SO_x), nitrogen oxides (NO_x), and particulate reductions achieved; confirmation of predicted efficiency; and operability and durability of test articles. The Department of Energy (DOE) Proof-of-Concept (POC) Multiyear Program will provide the reliability, durability data on commercial prototypic hardware by 1993. The POC program and its development is described. The feasibility of a 250-MWt MHD retrofit or demonstration plant has been verified in site-specific conceptual designs. Assessment of feasibility, performance, cost and schedule is reviewed for the study on Montana Power Company's J.E. Corette Plant. The strategic plan for bringing this MHD demonstration project into reality is outlined. These successful programs have proven MHD has the potential to be an important electric power generation technology for the 21st Century.

6557 (CONF-910571–, pp. 392-405) **Economic analysis of coal-fired magnetohydrodynamics.** Lohrasbi, J. (MSE, Inc., Butte, MT (United States)); Ashby, G.; Walter, F.E. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

This study is an economic comparison of the coal-fired magnetohydrodynamics (MHD) technology with conventional coal-fired steam power plants; the comparisons made are based on a levelized 'Cost of Electricity' for similarly sized plants. A revenue requirement analysis was used for the economic evaluation of engineering alternatives in the electric utility industry. The basis for the MHD technology used in the comparison is a recently completed conceptual design done by the MHD Development Corporation for retrofitting the coal-fired J.E. Corette plant with a 250-MW(t) MHD unit. A 500-MW(e) MHD consideration is based on the 'Advanced Power Train' predictions of the Department of Energy (DOE), and conventional plant considerations are based on the Technical Assessment Guide of the Electric Power Research Institute (EPRI). The economic comparisons indicate that MHD is considerably more attractive than a conventional unit.

6558 (CONF-910571–, pp. 490-500) **Full scale milling and burning tests of brown coal and sub-bituminous coal mixtures.** Ramos, J. (Endesa C.T., La Coruna (Spain)); Lucas, T.; Quintana, C.; Casares, J.J. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The Puentes 1400 MW power plant in Galicia, Spain, has burned the local brown coal with high sulfur content since start-up in April, 1976. A number of combustion-derived problems occurred right from the start. Early modifications alleviated some of these, but a number of major problems remained unsolved for almost a decade. When these combustion problems were finally solved, a decision was made to reduce SO_2 emissions significantly. The paper described the most significant results of combustion tests conducted on mixtures of the local brown coal and Powder River Basin sub-bituminous coal.

6559 (DOE/PC/90160–T3) **Advanced atomization concept for CWF burning in small combustors: Phase 2, Quarterly technical progress report No. 3, 1 April 1991–30 June 1991.** Heaton, H.; McHale, E. Atlantic Research Corp., Alexandria, VA (United States). 1991. 22p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-90PC90160. Order Number DE92004875. Source: OSTI; NTIS; GPO Dep.

The present project involves the second phase of research on a new concept in coal-water fuel (CWF) atomization that is applicable to burning in small combustors. It is intended to address the most important problem associated with CWF combustion; i.e., production of small spray droplets in an efficient manner by an atomization device. Phase 1 of this work was successfully completed with the development of an opposed-jet atomizer that met the goals of the first contract. Performance as a function of operating conditions was measured, and the technical feasibility of the device established in the Atlantic Research Atomization Test Facility employing a Malvern Particle Size Analyzer. Testing then proceeded to a combustion stage in a test furnace at a firing rate of 0.5 to 1.5 MMBtu/H.

6560 (ETDE-mf–2750173) **Development of a flexible power station program S.O.KR.A.T.E.S. with simultaneous technique of solutions in relation with the survey of modern power station concepts.** Werner, K. Essen Univ. (Gesamthochschule) (Germany). Fachbereich 13 - Energie-, Verfahrens- und Elektrotechnik. 17 Dec 1990 374p. (In German). Order Number DE92750173. Source: OSTI; NTIS (US Sales Only).

The work presented deals with the further development and use of a simulation program for power station processes. As a decisive objective, presentation is made on how to create a tool that, in regard to calculating thermal energy conversion, is universally implementable. In this case, however, the use even by non-programmers should be granted simultaneously, preferably unrestricted. A comparison of the principle technique of solution indicates first of all that simultaneous methods are more likely to contradict to the diverse, concivable problem definitions than sequential calculations. The use of the closed approach, however, goes along with the restriction that extensions in the program are handicaps themselves. Even though only one so-called open system appears purposeful in terms of the rapidly advanced research and development in the area of power station technology, the coupling of newly created algorithms is investigated in a special degree. For this purpose, a procedure is selected which depicts the way to include external calculations by selecting suitable interfaces. The characteristic of the closed technique of solution takes advantage of this type of step by providing a wide-range offer for user-specific defaults. Analogous to these gained experiences, further program development was made especially concerning material value and combustion calculation, and, in regard to the adaption to other computer systems, also was directed toward the standardization of programming languages. The appropriately modified program system subsequently led to the option in the last section of the work to investigate three projects of future power station processes. The selection could be coordinated in such a way that all major problem definitions occur that are relevant to the thematic currently being discussed. (orig./UA).

6561 **Destruction of acid gas emissions.** Mathur, M.P.; Fu, Yuan C.; Ekmann, J.M.; Boyle, J.M. To Dept. of Energy. 1990. Filed date 22 Jun 1990. USA Patent patent application 7-541,992. 16p. Sponsored by U.S. DOE Fossil Energy. Order Number DE92003812. Source: OSTI; NTIS; GPO Dep.

A method of destroying NO_x and SO_x in a combustion gas is disclosed. The method includes generating active species by treating stable molecules in a high temperature plasma. Ammonia, methane, steam, hydrogen, nitrogen or a combustion of these gases can be selected as the stable molecules. The gases are subjected to plasma conditions sufficient to create free radicals, ions or excited atoms such as N, NH, NH_2, OH, CH and/or CH_2. These active species are injected into a combustion gas at a location of sufficiently high temperature to maintain the species in active state and permit them to react with NO_x and SO_x. Typically the injection is made into the immediate post-combustion gases at temperatures of 475–950°C. 1 fig.

6562 (CONF-910571–, pp. 126-154) **Stationary combustion NO_x control: A summary of the 1991 symposium.** Kokkinos, A. (Electric Power Research Inst., Palo Alto, CA (United States)); Cichanowicz, J.E.; Hall, R.E.; Sedman, C.B. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The 1991 Symposium on Stationary Combustion NO_x Control was held March 25-28, 1991, in Washington, DC. The sixth meeting in a biennial series, the Symposium was cosponsored by the Electric Power Research Institute (EPRI) and the US Environmental Protection Agency (EPA). Approximately 500 individuals attended representing 53 domestic and 13 foreign utility companies, federal and state government agencies, research and development organizations, and equipment vendors from the US and abroad. Sixty-six presentations were made. This paper focuses on new results and understandings since the last Symposium in 1989 (JAPCA, August 1989) as they pertain to electric utility power plants and other boilers burning coal, oil, and gas. Key points include the significant increase in full-scale retrofit demonstrations of low-nitrogen oxide (NO_x) combustion systems in the US and abroad over the past two years; full-scale operating experience in Europe with selective catalytic reduction (SCR); pilot- and bench-scale SCR investigations in the US; increased attention on selective noncatalytic reduction (SNCR) in the US; and NO_x controls for oil- and gas-fired boilers.

6563 (CONF-910571–, pp. 344-360) **Houston Lighting and Power Company's coal combustion by-products utilization program: A decade of success.** Prusinski, J.R. (Houston Lighting and Power Co., Houston, TX (United States)); Weber, J.L.; Martinez, C.G.; Nichols, M.E. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

Houston Lighting and Power Company (HL and P) maintains two separate facilities with low-rank fuel fired units: the W.A. Parish Generating Station and the Limestone Electric Generating Station. The Parish plant has been operational since 1978 and has developed a successful coal combustion by-product utilization program. The Limestone plant, on line since 1985, produces a low quality ash and is located in a remote rural area thus severely limiting marketability of its ash. In 1990, W.A. Parish produced 480,000 tons of fly ash, bottom ash and fluidized gas desulfurization sludge (also referred to as 'scrubber base'). 61% of all by-products produced and 71% of fly ash in particular were marketed. Several factors have contributed to these high utilization rates: (1) product quality, (2) relationship with ash contractor/marketer, (3) ash management facilities, (4) quality assurance and control program, (5) sales and marketing efforts, (6) product line, (7) attention to industry, legislative and environmental concerns and (8) research and development programs. The Parish plant produces a high calcium Class C fly ash which is used principally as a low cost partial substitute for cement in concrete. Other applications for fly ash, bottom ash and scrubber base include secondary road construction, structural fills, waste processing and chemical fixation, brick manufacturing and soil stabilization. Several specific utilization applications both external and internal to HL and P are described. HL and P's research and development program includes deployment of artificial reefs, use of fly ash in precast/prestressed concrete products, use of fly ash to stabilize hazardous wastes and development of sulfate-resistant Class C fly ash concrete.

6564 (CONF-910571–, pp. 361-376) **Utilization of low-rank coal fly ash in high applications at a North Dakota power station.** Stewart, A.W. (Cooperative Power Association, Eden Prairie, MN (United States)). North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

In 1988 the North Dakota Mining and Mineral Resources Research Institute received an EPRI grant to study the construction and environmental aspects of a high volume cement replacement project was to demonstrate the use of a Class C fly ash to replace approximately 70% of the Portland cement in concrete and also to demonstrate its use in a flowable-slurry backfill material. Fresh fly ash from the Coal Creek Station, located near Falkirk, North Dakota, was used to make concrete for paving several roads and parking lots at the station and to make slurry for back filling several culverts. Twenty-five thousand square yards of pozzocrete and 35 cubic yards of slurry were placed for this project. The project was organized with four major tasks: (1) background monitoring, (2) construction monitoring, (3) environmental monitoring, and (4) post-construction performance monitoring of the concrete and slurry. Each of these are described. The replacement of a high volume of cement with Class C fly ash is an economical and viable practice. Based upon the results of over 5 years of traffic and freeze-thaw cycles on the pozzocrete placed at Coal Creek Station, the long term functionality has been proven. Construction techniques for concrete pavement, when properly applied, allow for the placement of pozzocrete in a proven fashion. This demonstration project should provide the data necessary to strengthen and increase the use of fly ash as a valuable engineering resource.

6565 (CONF-910571–, pp. 431-444) **Northern States Power Company Sherburne County Units 1 and 2 fly ash pond slope protection.** Pieper, L. (Northern States Power Company, Minneapolis, MN (United States)); Bluhm, S.; Moretti, C.; Dockter, B. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

Sherburne County Generation Plant (Sherco) Units 1 and 2 have limestone wet scrubbers to collect sulfur dioxide and fly ash. All the solids collected in the scrubbers are slurried to a storage pond. Construction of the pond placed the riprap only part-way up the slope. The water level in the pond is now high enough to require addition riprap. This project looks at fly ash from Riverside Unit 8 and Sherco Unit 3 as potential substitute materials for riprap, to protect pond slopes from erosion and to reduce costs. The laboratory testing had two phases. Phase 1 studied the fly ashes using four possible placement methods and three moisture levels for each placement method, for a total of 24 mixes of fly ash as possible slope protection material. Unconfined compressive strength tests were run on these 24 mixes. Using the results of the strength tests, nine mixes were chosen for Phase 2 of the laboratory testing. Phase 2 consisted of freeze-thaw resistance and erosion resistance tests. In addition to the testing mentioned above, an economic analysis of the placement methods was done on the mixes. The field testing also has two phases. Phase 1 of the field testing had six mixes selected using the results of the laboratory testing and the economic analysis. The placing of the mixes in the field helped to determine what equipment should be used to place the new slope protection material. Additional work was done on the economic analysis. Phase 2 field testing mix could have been any of the mixed used in Phase 1. The mix is Sherco 3 ash to be placed by compaction.

6566 (DOE/PC/88852-T3-Rev.1) **Duct injection technology prototype development: Materials corrosion report, Revision 1.** Harper, S.L. (Babcock and Wilcox Co., Alliance, OH (United States). Research and Development Div.). United Engineers and Constructors, Inc., Denver, CO (United States). Stearns-Roger Div.; Babcock and Wilcox Co., Alliance, OH (United States). Contract Research Div. Aug 1991. 42p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88852. Order Number DE92001791. Source: OSTI; NTIS; GPO Dep.

This report describes a test program conducted to determine the corrosion rate of materials in the dry scrubber or duct injection systems. Four materials were evaluated: 1010 carbon steel, Corten, 317SS and Hastelloy C-276. The results show that acidic conditions result in higher corrosion rates than alkaline conditions for all the materials. The carbon steel, Corten and stainless steel show moderate to heavy pitting attack in the acidic environment. For the alkaline conditions, the corrosion rates of carbon steel and Corten were higher than the stainless steel or Hastelloy C-276. Also, the corrosion rate of abraded specimens were four time those of unabraded specimens in the flue gas. It is probable that areas of wall-wetting and plugging in the duct injection process will exhibit high rates of corrosion for the carbon steel, Corten, and stainless steel materials. General corrosion and pitting corrosion will predominate. Additionally, abraded duct areas will corrode at a significantly higher rate than unabraded duct materials. 6 refs., 11 figs., 7 tabs.

6567 (DOE/PC/88868–T6) **Characterization and modification of particulate properties to enhance filtration performance: Quarterly technical progress report, March 1989–May 1989.** Snyder, T.R.; Robinson, M.S.; Vann Bush, P. Southern Research Inst., Birmingham, AL (United States). 22 Jun 1989. 47p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88868. Order Number DE92003088. Source: OSTI; NTIS; GPO Dep.

This report describes the results of project activities that occurred during the period from March 1 through May 31, 1989. The organization of this report generally follows the outline of work presented in the Project Work Plan. Work performed during this period included tests under Task 2 – Parametric Tests of Ashes and Fabrics, and Task 3 – Survey of Methods to Modify Particle Filtration Properties. Discussion of the Task 2 work has been organized topically, rather than adhering to the activities specified in the Work Plan. Cohesive ash from the Tennessee Valley Authority's 160 MW Atmospheric Fluidized-Bed Combustor at the Shawnee Plant in Paducah, Kentucky was obtained during this quarter and has been analyzed in the laboratory. The second phase of the abstract search and review of pertinent articles included in activity 3.1 is nearly complete. A summary of this phase of the literature search is included in this report. A variety of potential conditioning agents have been evaluated during this reporting period. These agents include sodium bicarbonate, hydrated lime, various grades of fine silica powder, gasifier char, glass beads and glass fibers. The three source ashes have been mixed with these agents in different concentrations and using various mixing techniques. These tests are continuing, and this report contains a summary of the combinations evaluated during this past quarter. 17 figs., 7 tabs.

6568 (ANL/CP-74787) **Greenhouse gas emissions control by economic incentives: Survey and analysis.** South, D.W.; Kosobud, R.F.; Quinn, K.G. Argonne National Lab., IL (United States). [1991]. 13p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. (CONF-911184–7: 13. annual North American conference of the International Association for Energy Economics, Chicago, IL (United States), 18-20 Nov 1991). Order Number DE92004125. Source: OSTI; NTIS; GPO Dep.

This paper presents a survey of issues and concerns raised in recent literature on the application of market-based approaches to greenhouse effect policy with an emphasis on tradeable emission permits. The potential advantages of decentralized decision-making – cost-effectiveness or allocation efficiency, stimulation of innovations, and political feasibility are discussed. The potential difficulties of data recording, monitoring, enforcement, and of creating viable emission permit contracts and markets are examined. Special attention is given to the problem of designing a greenhouse effect policy that is cost-effective over time, a problem that has been given little attention to date. Proposals to reduce or stabilize greenhouse gas emission (especially CO_2) in the short run require high carbon tax rates or permit prices and impose heavy adjustment costs on the fossil fuel industry. A more cost-effective time path of permit prices is proposed that achieves the same long-run climate change stabilization goals. 21 refs., 3 figs.

21 NUCLEAR POWER REACTORS AND ASSOCIATED PLANTS

Refer also to citation(s) 6627

6569 (IAEA-TECDOC–621) **Good practices for outage management in nuclear power plants.** International Atomic Energy Agency, Vienna (Austria). Sep 1991. 204p. Order Number DE92615098. Source: OSTI; NTIS (US Sales Only); INIS.

As a follow-up to an earlier Technical Document on Good Practices for Improved Nuclear Power Plant Performance (IAEA-TECDOC-498), the Agency has produced a more focused technical report on good practices associated with nuclear power plant outage planning and execution. As with the earlier document, the overall aim is that by identifying good practices in the key aspects of outage management, overall world nuclear performance will improve and the gap between excellent performers and operators with developing programmes will be narrowed. This document has been produced through the contribution of numerous operators and government agencies. It aims at minimizing text and focusing on actual good practices in use which can be found in the annexes. While the specific methods used to achieve excellence in maintenance/refuelling outages may differ, the fundamental requirements of outage management are discussed.

6570 (IAEA-TECDOC--627) **Catalogue of methods, tools and techniques for recovery from fuel damage events.** International Atomic Energy Agency, Vienna (Austria). Oct 1991. 339p. Order Number DE92615099. Source: OSTI; NTIS (US Sales Only); INIS.

On the basis of the recommendations of the Advisory Group Meeting on Main Principles of Safe Management of Severely Damaged Nuclear Fuel and other Accident Generated Waste, held from 13 to 16 November 1989, the IAEA initiated a programme in 1990 to collect technical information on special tools and methods to deal with circumstances beyond the normal design basis of fuel damage. A Questionnaire was sent out to solicit information from the Member States and organizations which might have experience in this field. The responses to the Questionnaire were discussed at a Consultants Meeting and at an Advisory Group Meeting during 1990. The aim of this document is to disseminate the experience gained in Member States serving Article 5 of the Convention on Assistance in the Case of a Nuclear Accident or Radiological Emergency and also filling a potential void in response to fuel damage events of less severe magnitude.

6571 (IAEA-TECDOC--632) **ASSET guidelines. Revised 1991 Edition: Reference material prepared by the International Atomic Energy Agency for Assessment of Safety Significant Events Teams.** International Atomic Energy Agency, Vienna (Austria). Dec 1991. 150p. Order Number DE92615100. Source: OSTI; NTIS (US Sales Only); INIS.

The present publication is an updated version of the IAEA Assessment of Safety Significant Events Team (ASSET) Guidelines, IAEA-TECDOC-573, published in 1990. Sections 5 and 6 include revised definitions and investigation guidelines for identification of both direct and root causes. These revisions were recommended by a Consultants Meeting held in Vienna on 3-7 December 1990. This guidance is not intended to infringe an expert's prerogative to investigate additional items. Its main purpose is to provide a basic structure and ensure consistency in the assessments. Use of the ASSET guidelines should also facilitate comparison between the observations made in different nuclear power plants and harmonize the reporting of generic ASSET results. The guidelines should always be used with a critical attitude and a view to possible improvements.

6572 (INIS-mf--13066) **Power engineering constructions: Project design procedure.** Chalus, Z.; Misterka, V.; Horak, P. Ceske Energeticke Zavody, Prague (Czechoslovakia). 1991 92p. (In Czech). Order Number DE92613801. Source: OSTI; NTIS (US Sales Only); INIS.

Methods and applications of the design procedure, looked upon as a manifestation of management skills, are described on examples of the Finnish and French state power companies IVO and EdF, respectively. For understanding the activities at IVO, facts concerning the development of the organization structure of this joint-stock company and its rules as well as basic data of the Finnish power industry are given. The IVOSTUDY program package used for decision-making in the field of capital investments is described, as are the information systems employed by the managements of IVO and EdF. The management program systems ARTEMIS, BASIS, AFORA PMS and APROS are also discussed and experience from their use by the two companies is summarized. (J.P.).

6573 (KFK--4837) **KfK, Institute for Reactor Development. Results of research and development activities in 1990.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Reaktorentwicklung (IRE). Mar 1991. 29p. (In German). Order Number DE92759305. Source: OSTI; NTIS (US Sales Only); INIS.

R and D activities at IRE (Institut fuer Reaktorentwicklung-Institute for Reactor Development) are dedicated to power engineering and handling processes in the framework of the point-of-main-effort projects 'nuclear fusion', 'solid-state and materials research', 'handling', 'nuclear safety' and 'miscellaneous research'. Nuclear fusion contributions deal with special vacuum system design problems, heavy-duty design and materials selection and safety aspects. Specimens from 30 different carbon-based materials were subjected to comparative tests in a plasma spraying plant. In the framework of solid-state and materials research activities a viscoplastic model for mechanical component analysis was investigated for its compatibility with elementary physical laws under complex loads. The handling project was dedicated to the specific requirements of nuclear fusion with regard to JET and NET uses, the development of system solutions for flexible industrial techniques, and to standardization. A study on the control system of a work station for NET remote handling tasks was completed. In the framework of the nuclear safety project one currently investigates the dynamics of fast reactors under failure conditions, the possible propagation of local cooling failures in the reactor core, and core monitoring problems. (orig./GL).

6574 (NUREG/CR--5645) **Acoustic emission/flaw relationships for inservice monitoring of LWRs.** Hutton, P.H. (Pacific Northwest Lab., Richland, WA (United States)); Kurtz, R.J.; Friesel, M.A.; Skorpik, J.R.; Dawson, J.F. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 116p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. (PNL--7479). Source: OSTI; NTIS; INIS; GPO.

The program concerning Acoustic Emission/Flaw Relationships for Inservice Monitoring of LWRs was initiated in FY76 with the objective of validating the application of acoustic emission (AE) to monitor nuclear reactor pressure-containing components during operation to detect cracking. The program has been supported by the US Nuclear Regulatory Commission, Office of Nuclear Regulatory Research. Research and development has been performed by Pacific Northwest Laboratory, operated for the Department of Energy by Battelle Memorial Institute. The program has shown the feasibility of continuous, on-line AE monitoring to detect crack growth and produced validated methods for applying the technology. Included are relationships for estimating flaw severity from AE data and field applications at Watts Bar Unit 1 Reactor, Limerick Unit 1 Reactor, and the High Flux Isotope Reactor. This report discusses the program scope and organization, the three program phases and the results obtained, standard and code activities, and instrumentation and software developed under this program.

6575 (ORNL/CSD/TM--268) **Feasibility assessment of burnup credit in the criticality analysis of shipping casks with boiling water reactor spent fuel.** Broadhead, B.L. Oak Ridge National Lab., TN (United States). Aug 1991. 44p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC05-84OR21400. (TTC--1033). Order Number DE92002402. Source: OSTI; NTIS; INIS; GPO Dep.

Considerable interest in the allowance of reactivity credit for the exposure history of power reactor fuel currently exists. This "burnup credit" issue has the potential to greatly reduce risk and cost when applied to the design and certification of spent fuel casks used for transportation and storage. Recently, analyses have demonstrated the technical feasibility and estimated the risk and economic incentives for allowing burnup credit in pressurized water reactor (PWR) spent fuel shipping cask applications. This report summarizes the extension of the previous PWR technical feasibility assessment to boiling water reactor (BWR) fuel. This feasibility analysis aims to apply simple methods that adequately characterize the time-dependent isotopic compositions of typical BWR fuel. An initial analysis objective was to identify a simple and reliable method for characterizing BWR spent fuel. Two different aspects of fuel characterization were considered:I first, the generation of burnup dependent material interaction probabilities; second, the prediction of material inventories over time (depletion). After characterizing the spent fuel at various stages of exposure and decay, three dimensional (3-D) models for an infinite array of assemblies and, in several cases, infinite arrays of assemblies in a typical shipping cask basket were analyzed. Results for assemblies without a basket provide reactivity control requirements as a function of burnup and decay, while results including the basket allow assessment of typical basket configurations to provide sufficient reactivity control for spent BWR fuel. Resulting basket worths and reactivity trends over time are then evaluated to determine whether burnup credit is needed and feasible in BWR applications.

6576 (PSI–108) **Effective void fraction for a BWR assembly with boiling in the bypass region.** Galperin, A. (Ben-Gurion Univ. of the Negev, Beersheba (Israel)); Segev, M.; Knoglinger, E. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1991. 90p. (STARS–5.). Order Number DE92613804. Source: OSTI; NTIS (US Sales Only); INIS.

Average BWR assembly cross-sections for nominal conditions, namely for zero bypass void, can be utilised in the analysis of transient conditions with boiling in the bypass. A model is developed to yield an effective channel void for such conditions. The use of this void in conjunction with the 'nominal conditions' cross section library approximately preserves the assembly K-infinity corresponding to the true channel and bypass voids. The effective void is an augmentation of the actual channel void. The augment is proportional to the bypass-to-channel volume ratio, to the bypass void, and to a weight W which is introduced to quantify the fact that a water molecule in the bypass has a different assembly criticality worth than one in the channel. The formula developed is superior to the practice of choosing W=1, namely a simple, non-weighted, transfer of water from channel to bypass. The use of this approximate effective channel void reproduces actual K-infinity values of assemblies to better than 5 mk, whereas the use of a simple model sometimes misspredicts the assembly K-infinity by 40 mK. The effective void model cannot handle cases in which both channel and bypass void value are high, simply because then the effective void α_{ch}^{eff} becomes meaningless. A method to treat the $\alpha^{eff}>1$ domain is developed by which corrections to cross sections are provided. Such corrections are synthesised as functions of the assembly parameters. 6577 (SV-U–91-41) **Long-time measurements of prestressed tendon forces in reactor containment, Forsmark nuclear power station, unit 1.** Hallbjoern, L. Swedish State Power Board, Vaellingby (Sweden). 25 Jan 1991. 53p. (In Swedish). Order Number DE92615103. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of the measurements has been to determine the time-dependent force variation in the tendons. The measurements have now been performed during 14 years and the results are reported here. Measurements can continuously be carried out also in the future. The tendon forces are decreasing with time. The force reduction is the sum of the following three parts: stress loss due to concrete shrinkage, concrete creep and prestressing steel relaxation. The measurement results can be compared with the originally assumed long-time prestress losses. The force decrease in the tendons follow a straight line when illustrated in a diagram with logarithmic time-axis. At the distinct temperature-rise in the building when power generation started 4-5 years after prestressing this line will get a sharp bend so that the latter part of the line will have a greater slope than the former part. The prestressing force losses extrapolated to 30 years are just less than half the losses assumed in the design calculations. These favourable results from measurements during 14 years are valuable with respect to the actual structure and also to other structures of same or similar kind. The measurements have been made possible from the fact that the tendons have not been cement-grouted. They were left in their ducts with a corrosion protection of circulating dried air. (au).

In recent years there has been an increased growth of interest in object oriented programming which is a new approach to software construction having wide application. The possibility of using object oriented programming to build a software package that will assist the nuclear reactor operator in diagnosing any faults or alarms in the Loss Of Fluid Test (LOFT), a small scale pressurised water reactor, reactor is investigated in this work. (author).

6579 (INIS-GB–375) **Petri nets and fault diagnosis in nuclear reactors.** Jalel, N.A.; Nicholson, H. Sheffield Univ. (United Kingdom). Nov 1990 18p. (RR–413.). Order Number DE92615106. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of applying Petri nets (Pns) as a modelling tool to represent any fault or accident that might occur in the Loss Of Fluid Test (LOFT) reactor, small scale pressurised water reactor, is discussed and analysed. Pns are developed to assist the nuclear reactor operator in identifying any fault or alarm that might arise in the power station. (author).

6580 (INIS-GB–376) **The application of neural networks for fault diagnosis in nuclear reactors.** Jalel, N.A.; Nicholson, H. Sheffield Univ. (United Kingdom). Nov 1990 19p. (RR–411.). Order Number DE92615107. Source: OSTI; NTIS (US Sales Only); INIS.

In recent years considerable work have been done in the field of neural networks due to the recent development of effective learning algorithms, and the results of their applications have suggested that they can provide useful tools for solving practical problems. Artificial neural networks are mathematical models of theorized mind and brain activity. They are aimed to explore and reproduce human information processing tasks such as speech, vision, knowledge processing and control. The possibility of using artificial neural networks for fault and accident diagnosis in the Loss Of Fluid Test (LOFT) reactor, a small scale pressurised water reactor, is examined and explained in the paper. (author).

6581 (JAERI-M–91-143) **Analysis of operating experience data in nuclear power plants: Loss of decay heat removal during reactor shutdown.** Watanabe, Norio (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Hirano, Masashi; Oikawa, Tetsukuni. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1991. 184p. (In Japanese). Order Number DE92750964. Source: OSTI; NTIS (US Sales Only); INIS.

This report analyzes pressurized water reactor (PWR) and boiling water reactor (BWR) experience involving loss of decay heat removal (DHR) during reactor shutdown. Referring to USNRC's Licensee Event Reports (LERs), OECD/NEA-IRS reports, etc., we selected 206 loss of DHR events which have occurred in PWRs between 1976 and 1990 and 48 events in BWRs between 1985 and 1990. Analysis of 197 events which have occurred in U.S. PWRs indicates that the following direct causes are major contributions resulting in loss of DHR during reactor shutdown: 1) Inadvertent automatic closure of the suction/isolation valves in residual heat removal (RHR) system, 2) RHR pump cavitation due to air entrainment in reduced coolant inventory condition, and 3) Loss of power to RHR pumps. Human factors deficiencies involving procedural inadequacies and personnel errors were identified as the most significant underlying or root causes of the loss of DHR events. Most of the errors were committed during maintenance, testing and repair works. As for 48 events in U.S. BWRs, the leading category of loss DHR events was the inadvertent automatic closure of the suction/isolation valves in RHR system, most of which were caused by human errors. This report describes the above analysis results and presents the events description for the selected significant events. As well, the brief descriptions of the 206 events in PWRs and 48 events in BWRs are provided in Appendix. (author).

6582 (KAERI/RR–946/90) **Study on the computerization of PWR secondary side chemistry monitoring.** Yang, Kyung Rin (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Koo, Je Hyoo; Lee, Eun Hee; Hong, Kwang Bum; Kang, Hee Suck. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 114p. (In Korean). Order Number DE92615108. Source: OSTI; NTIS (US Sales Only); INIS.

Samples of the secondary system in the Yong Gwang 1 Plant were sampled and analysed once a month at 13 sampling points. The main components of materials in the secondary system and corrosion products consisted of iron. Therefore, iron component was used with the index of corrosion products. The weight of iron which was accumulated in the bottom of stea generator can be calculated from the iron concentration and flow rates. That is, the weight of iron which was flowed into the steam generator belonging to the feedwater and the weight of iron which was discharged out from the steam generator was calculated. From these data, the weight of iron which was accumulated in the steam generator was calculated. According to the calculation, it was found that the amount of accumulated iron was 2.01 kg /year for the steam generator A, 1.73 kg /year for the steam generator B and 1.84 kg /year for the steam generator C. (Author).

6583 (KFK–4850, pp. 211-215) **Measurements of turbulent velocity and temperature in a central channel of a heated rod bundle.** Mensinger, E. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik); Meyer, L. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

A number of experiments has been performed in various rod bundle geometries with isothermal flow. A large number of the available data were acquired in a 4-rod rectangular channel. To model the heated flow correctly a knowledge of turbulent temperature fluctuations such as the eddy diffusivity of heat in all directions is necessary. Since no such data were available for flow through rod bundles, it is the aim to measure the turbulent quantities in heated flow through triangular array rod bundles. The experimental rig was completed last year, all data acquisition and control systems were tested and a first series of measurements were performed. (orig./DG).

6584 (KFK–4850, pp. 216-227) **Investigations in freon on critical heat flux (KRISTA-program).** Erbacher, F.J. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Reaktorbauelemente); Cheng, X.; Just, W.; Neitzel, H.J. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). An experimental study of CHF in closely spaced 7 rod bundles is performed in the KRISTA test facility. The experiments covered a wide range of parameters of interest to high conversion pressurized water reactors (HCPWR). Under comparable conditions the CHF value in bundles is lower than in tubes. The influence of spacers (grid spacer and wire wrap) on CHF has been found to depend strongly on local steam quality. With regard to the CHF behaviour under HCPWR conditions no noticeable improvement has been achieved in a wire wrapped bundle than in a bundle with grid spacers. (orig.).

6585 (NUREG/CR–5796) **Steam generator operating experience, update for 1989–1990.** Frank, L. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Viking Systems International, Pittsburgh, PA (United States). Dec 1991. 113p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This report summarizes operational events and degradation mechanisms affecting pressurized water reactor steam generator integrity. It provides: results of 1989 and 1990 steam generator inspections; highlights prevalent problem areas; improvements that have been made in nondestructive testing methods; preventive measures; repair techniques; and replacement procedures. It describes the equipment of the three (3) major suppliers and discusses recent examinations of 76 plants. Major areas of concern are the steam generator degradation mechanisms that affect tube integrity or cause tube leakage and tube failure. These include; (1) intergranular attack (IGA); (2) intergranular stress corrosion cracking (IGSCC); (3) primary water stress corrosion cracking (PWSCC); (4) pitting; and (5) vibrational wear and fatigue. Also discussed are plugging, sleeving, heat treatment, peening, chemical cleaning, and steam generator replacements. The current status of regulatory instruments and inspection guidelines for ensuring the steam generator integrity, is discussed with the highlights of steam generator research. New potential safety issues such as circumferential cracking and tube plug cracking are also discussed.

6586 (PSI–97) **Advanced LOCA code uncertainty assessment: preliminary calculations for Westinghouse 4 loop PWR.** Coddington, P. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Wickett, A.J. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Jun 1991. 68p. Order Number DE92613818. Source: OSTI; NTIS (US Sales Only); INIS.

Three large break LOCA calculations for Sizewell B using TRAC-PF1/MOD1 have been performed. They are: base case, post-dryout heat transfer x 0.5, condensation Stanton number x 0.1. The reduction in post-dryout heat transfer (PDHT) is based on TRAC analysis of LTSF high pressure reflood experiments, PDHT experiments at Winfrith and Harwell and the Winfrith ACHILLES experiment. The reduction in condensation is based on TRAC analysis of refill experiments in a scaled rig at Strathclyde University and comparisons with experimental data in the TRAC models and correlations document. The base case and reduced heat transfer case were compared with other similar calculations. The results were consistent, difference being accounted for qualitatively. The three cases were compared with one another. The resulting peak clad temperatures were: base case: 963 K, post-dryout heat transfer x 0.5: 1113 K, condensation Stanton number x 0.1: 1003 K. The reduction in post-dryout heat transfer worsens cooling during blowdown, increasing the second blowdown peak clad temperature. This higher temperature persists and the reduction in heat transfer further increases the maximum rod temperature, compared with the base case, during reflood. The reduction in condensation reduced the oscillations in core flow during the first 40 seconds of reflood. This in turn appears to have worsened heat transfer resulting in more rapid clad heatup and a higher peak temperature than in the base case. (author) 42 figs., 28 refs.

6587 (SAND–91-7073) **Nuclear reactor pressure vessel flaw distribution development: Phase 2, Methodology and application.** Kennedy, E.L. (Failure Analysis Associates, Inc., Menlo Park, CA (United States)); Foulds, J.R.; Basin, S.L. Sandia National Labs., Albuquerque, NM (United States); Failure Analysis Associates, Inc., Menlo Park, CA (United States). Dec 1991. 103p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC04-76DP00789. Order Number DE92005353. Source: OSTI; NTIS; INIS; GPO Dep.

Previous attempts to develop flaw distributions for probabilistic fracture mechanics analyses of pressurized water reactor (PWR) vessels have aimed at the estimation of a "generic" distribution applicable to all PWR vessels. In contrast, this report describes (1) a new flaw distribution development analytic methodology that can be applied to the analysis of vessel-specific inservice inspection (ISI) data, and (2) results of the application of the methodology to the analysis of flaw data for each vessel case (ISI data on three PWR vessels and laboratory inspection data on sections of the Midland reactor vessel). Results of this study show significant variation among the flaw distributions derived from the various data sets analyzed, strongly suggesting than a vessel-specific flaw distribution (for vessel integrity prediction under pressurized thermal shock) is preferred over a "generic" distribution. In addition, quantitative inspection system flaw sizing accuracy requirements have been identified for developing a flaw distribution from vessel ISI data. The new flaw data analysis methodology also permits quantifying the reliability of the flaw distribution estimate. Included in the report are identified needs for further development of several aspects of ISI data acquisition and vessel integrity prediction practice.

6588 (ENET–8900340/1) **Developmental work for the steam generators and the NWA-heat exchangers of the HTR-500 reactor.** Bundesamt fuer Energiewirtschaft, Bern (Switzerland). Jun 1990. 19p. (In German). Order Number DE92613830. Source: OSTI; NTIS (US Sales Only); ENET, Elfenauweg 29, CH-3006 Bern (CH).

Within the framework of cooperation in the HTR-500 Project between the IGNT and BBC/HRB Sulzer has completed development work for steam generators and residual heat dissipation heat exchangers. This work lasted over the period from December 1986 to September 1989 and was financed equally by Swiss public funds and Sulzer. The progress of the work was described in detail in regular quarterly reports. The current report gives a summary presentation.

6589 (IWGGCR–25, pp. 139-143) **Fission-gas release during hydrolysis of exposed fuel kernels.** Richards, M.B. (General Atomics, San Diego, CA (United States)); Hanson, D.L.; Turner, R.F. International Atomic Energy Agency, Vienna (Austria). International Working Group on Gas-Cooled Reactors. Nov 1991. (CONF-9011211–: International Atomic Energy Agency (IAEA) specialists meeting on behaviour of gas cooled reactor fuel under accident conditions, Oak Ridge, TN (United States), 5-7 Nov 1990). In *Behaviour of gas cooled reactor fuel under accident conditions: Proceedings of a specialists meeting held in Oak Ridge, 5-8 November 1990.* 164p. Order Number DE92612905. Source: OSTI; NTIS (US Sales Only); INIS.

A potential mechanism for fission-gas release from the Modular High-Temperature Gas-Cooled Reactor (MHTGR) results from the reaction of failed fuel with water vapor during hypothetical accident scenarios. During this reaction, known as fuel hydrolysis, water vapor reacts with the small fraction of exposed fuel kernels to release fission gases that have accumulated in the kernel pore space. Experimental work has been performed to obtain data for quantifying the release of fission products during fuel hydrolysis. The most recent experiments were the irradiations of capsule HRB-17 at Oak Ridge National Laboratory and capsule HFR-B1 at the Petten Establishment in the Netherlands. An analysis of the HRB-17 data has shown that the fractional release of stored fission gases is proportional to approximately the square of the H_2O partial pressure over the range 200 to 2000 μatm. During MHTGR-accident scenarios,(H_2O) partial pressures are expected to be much higher ($\approx$3.5 atm). During the HFR-B1 irradiation, the water-vapor injections covered an expanded range of 200 to 10,600 μatm H_2O. In this paper, a preliminary evaluation of the HFR-B1 data is described. The HFR-B1 data indicate that the fractional release from failed fuel becomes independent of H_2O partial pressure for the range 5000 to 10,000 μatm. This result is consistent with the Langmuir-type mechanism observed in most gas-solid reactions and is also in agreement with previous measurements on unirradiated UC_2 kernels. At high H_2O partial pressures, the fractional release appears to level off at 20-30% of the exposed kernel inventory for reaction times on the order of one day. For typical MHTGR-accident scenarios, the reaction times are expected to be about one hour, and the observed fractional release is less than 0.1%, or more than an order of magnitude below the current model prediction of 6% of exposed kernel inventory.

6590 (IWGGCR–25, pp. 157-162) **In-pile corrosion of grade H-451 graphite by steam.** Richards, M.B. (General Atomics, San Diego, CA (United States)); Gillespie, A.G.; Hanson, D.L. International Atomic Energy Agency, Vienna (Austria). International Working Group on Gas-Cooled Reactors. Nov 1991. (CONF-9011211–: International Atomic Energy Agency (IAEA) specialists meeting on behaviour of gas cooled reactor fuel under accident conditions, Oak Ridge, TN (United States), 5-7 Nov 1990). In *Behaviour of gas cooled reactor fuel under accident conditions: Proceedings of a specialists meeting held in Oak Ridge, 5-8 November 1990.* 164p. Order Number DE92612905. Source: OSTI; NTIS (US Sales Only); INIS.

The fuel elements for the Modular High-Temperature Gas-Cooled Reactor (MHTGR) are to be manufactured from a near-isotropic graphite, such as grade H-451. For economical plant operation, graphite corrosion must not impact the normal fuel-element replacement schedule and must not be the cause of extended reactor-shutdown periods. Graphite corrosion and the potential for increased fission-gas release from fuel hydrolysis are inherently coupled; the water vapor must first penetrate a web of graphite before reaching the fuel compacts that contain the small fraction of failed particles. Hence, graphite corrosion is an important issue for both plant design and safety. In general, previous calculations have not shown good agreement with data obtained from out-of-pile and in-pile experiments that involve both transport and reaction phenomena, unless significant adjustments were made to model parameters, including reaction-rate correlations. The currently used reaction-rate correlations, were developed from out-of-pile data. Under in-pile conditions, radiolysis of water vapor and neutron-induced damage to the graphite may enhance graphite corrosion. The recently completed irradiation of capsule HFR-B1 provided some unique data for in-pile corrosion of H-451 graphite. In this paper, the HFR-B1 graphite-corrosion data are analyzed and compared with model predictions. The calculations were performed using a new corrosion model that previously showed good agreement with burnoff-profile data for out-of-pile corrosion of grade 2020 graphite. Improvements in the new model include a correction in the mass-sink term for steam, and improved models for the burnoff factor and the effective diffusivity of steam in graphite. Predictions obtained suing the new model are also in good agreement with the HFR-B1 data, which indicates that the currently used reaction-rate correlation may be used to predict in-pile corrosion with good accuracy.

6591 (IWGGCR–25, pp. 111-116) **Preliminary safety assessment of the 450 MWT MHTGR.** Dunn, T.D. (General Atomics, San Diego, CA (United States)); Datta, K.; Hoot, C. International Atomic Energy Agency, Vienna (Austria). International Working Group on Gas-Cooled Reactors. Nov 1991. (CONF-9011211–: International Atomic Energy Agency (IAEA) specialists meeting on behaviour of gas cooled reactor fuel under accident conditions, Oak Ridge, TN (United States), 5-7 Nov 1990). In *Behaviour of gas cooled reactor fuel under accident conditions: Proceedings of a specialists meeting held in Oak Ridge, 5-8 November 1990.* 164p. Order Number DE92612905. Source: OSTI; NTIS (US Sales Only); INIS.

The Modular High-Temperature Gas-Cooled Reactor (MHTGR) design has been reevaluated to improve its economic potential. As part of a plant cost reduction study, a range of core designs from the reference 350 MWT design to a maximum of 600 MWT have been studied. Based on an evaluation of key accidents, the recommended 450 MWT MHTGR appears to offer a comparably high level of safety as did the reference 350 MWT plant. The design features of the 450 MWT plant that most impact safety include a larger radionuclide inventory, a larger fueled annular core with its subsequent impact on heat transfer, a core power density about the same as the 350 MWT, and the replacement of fertile thorium fuel with natural uranium. The fissile fuel remains low enriched UCO. These combined design changes result in lower decay heat during accidents than the reference plant. The preliminary 450 MWT safety analysis investigated key design basis conduction cooldown events that included simultaneous loss of all forced cooling and helium coolant. These assessments used a revised accident fuel performance model and a decay heat evaluation specific to the 450 MWT fuel cycle. The fuel performance model used is based on recent FRG fuel sphere heating data that augment the current data base. The limiting MHTGR safety requirement is the Protective Action Guide's preventative thyroid inhalation dose at the Exclusion Area Boundary.

6592 (Juel–2502) **Investigations for the constructive layout and design of a prestressed cast-steel pressure vessel for the HTR-module.** Stoltz, A. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik; Technische Hochschule Aachen (Germany). Jul 1991. 181p. (In German). Order Number DE92750118. Source: OSTI; NTIS (US Sales Only); INIS.

A prestressed cast-steel pressure vessel is developed as bursting-resistant alternative to the conventional steel pressure vessel for the HTR-Module. The lower quality-demands necessary to guarantee the safety are favourable especially for the operation of the prestressed vessel in less industrialized countries. The prestressed reactor pressure vessel is designed methodically and to a great deal dimensioned by existing regulations. A main point is the realization of a prestressing system for the large lateral opening of the tube which connects both vessels for the reactor and steam generator. Investigations of the mechanical stresses inside the carrying components at design conditions and during transient conditions show, that the safety-demands of the nuclear regulation can be fulfilled. Studies concerning the seismic behaviour of an analogous duo-vessel-system give information about a useful design of the vessel bearings. A cost-analysis shows, that the prestressed system is able to compete economically with the steel pressure vessel. Further technical and economical investigations point out potentials for optimizing the vessel system. (orig.).

6593 (ORNL/ER–61) **Annual summary report of the decontamination and decommissioning surveillance and maintenance program at Oak Ridge National Laboratory for period ending September 30, 1991.** Ford, M.K.; Holder, L. Jr. Oak Ridge National Lab., TN (United States). Sep 1991. 9p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. Order Number DE92003746. Source: OSTI; NTIS; INIS; GPO Dep.

The Surplus Facilities Management Program and Defense Facilities Decommissioning Program were established at Oak Ridge National Laboratory (ORNL) in 1976 in order to provide collective management of all surplus sites under ORNL control on the Oak Ridge Reservation. Some 34 facilities, classified into 3 civilian-related and 8 defense-related projects, are currently managed by the recently integrated Decontamination and Decommissioning Program. Support includes (1) surveillance and maintenance (S&M) planning, (2) routine S&M, and (3) special maintenance projects. This report documents routine S&M, special projects, and special maintenance performed on these facilities for the period of October 1990 through September 1991.

Numerous advanced techniques have been evaluated and tested at EBR-2 as part of a plant-life extension program for detection of degradation and other abnormalities in plant systems. Two techniques have been determined to be of considerable assistance in planning for the extended-life operation of EBR-2. The first, a computer-based pattern-recognition system (System State Analyzer or SSA) is used for surveillance of the primary system instrumentation, primary sodium pumps and plant heat balances. This surveillance has indicated that the SSA can detect instrumentation degradation and system performance degradation over varying time intervals and can be used to provide derived signal values to replace signals from failed sensors. The second technique, also a computer-based pattern-recognition system (Sequential Probability Ratio Test or SPRT) is used to validate signals and to detect incipient failures in sensors and components or systems. It is being used on the failed fuel detection system and is experimentally used on the primary coolant pumps. Both techniques are described and experience with their operation presented.

6598 (ANL/CP–73424) **Validation of the REBUS-3/RCT methodologies for EBR-II core-follow analysis.** McKnight, R.D. Argonne National Lab., IL (United States). [1992]. 5p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. (CONF-920308–1: Advances in reactor physics, Charleston, SC (United States), 8-11 Mar 1992). Order Number DE91015138. Source: OSTI; NTIS; INIS; GPO Dep.

One of the many tasks to be completed at EBR-2/FCF (Fuel Cycle Facility) regarding fuel cycle closure for the Integral Fast Reactor (IFR) is to develop and install the systems to be used for fissile material accountancy and control. The IFR fuel cycle and pyrometallurgical process scheme determine the degree of actinide of actinide buildup in the reload fuel assemblies. Inventories of curium, americium and neptunium in the fuel will affect the radiation and thermal environmental conditions at the fuel fabrication stations, the chemistry of reprocessing, and the neutronic performance of the core. Thus, it is important that validated calculational tools be put in place for accurately determining isotopic mass and neutronic inputs to FCF for both operational and material control and accountancy purposes. The primary goal of this work is to validate the REBUS-2/RCT codes as tools which can adequately compute the burnup and isotopic distribution in binary- and ternary-fueled Mark-3, Mark-4, and Mark-5 subassemblies. 6 refs.

6599 (ANL/CP–74230) **Desirable LMR design features: Lessons learned from EBR-II operating experience.** Chang, Y.I. Argonne National Lab., IL (United States). [1991]. 6p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. (CONF-9110153–1: Potential of small nuclear reactors for future clean and safe energy sources, Tokyo (Japan), 23-25 Oct 1991). Order Number DE92003517. Source: OSTI; NTIS; INIS; GPO Dep.

The Experiment Breeder Reactor, EBR-II, has now entered its 28th year of operation. Many years of excellent operating experience have demonstrated the feasibility of conducting routine and special maintenance on sodium systems and components. In general, the concerns earlier expressed for the maintenance, modification, and repair of intrinsically radioactive and sodium-contaminated components have not materialized. This document discusses the experience obtained through these years of operation and the design features of EBR-II. 2 figs.

6600 (ANL/CP–74690) **Status of development and licensing support for advanced liquid metal reactors in the United States.** Pedersen, D.R. (Argonne National Lab., IL (United States)); Gyorey, G. Argonne National Lab., IL (United States). [1991]. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. (CONF-9111128–1: International Atomic Energy conference, Mito (Japan), 5-7 Nov 1991). Order Number DE92003413. Source: OSTI; NTIS; INIS; GPO Dep.

The cornerstones of the United States Advanced Liquid Metal Cooled Reactor (ALMR) program sponsored by the Department of Energy are: the ALMR plant design program at General Electric based on the PRISM (Power Reactor Innovative Small Module) concept, and the Integral Fast Reactor program (IFR) at Argonne National Laboratory (ANL). The goal of the US program is to produce a standard, commercial ALMR, including the associated fuel cycle. The paper addresses the status of the IFR program, the ALMR program and the interaction of the ALMR program with the regulatory environment.

6601 (EUR–13489) **Decontamination between dismantling of the Rapsodie primary coolant circuit.** Costes, J.R. (CEA Etablissement de la Vallee du Rhone, 30 - Bagnols-sur-Ceze (FR)); Gauchon, J.P.; Antoine, P. Commission of the European Communities, Luxembourg (Luxembourg). 1991. 78p. (In French). Contract FI1D-0061. Source: OSTI; NTIS (US Sales Only).

The large-scale decontamination of FBR sodium loops is a novel task, as only a limited number of laboratory-scale results are available to date. The principal objective of this work is to develop a suitable decontamination procedure for application to the primary loops of the RAPSODIE fast breeder reactor as part of decommissionning to Stage 2.

6602 (INIS-mf–13025 vp.) **Plutonium technology in Germany: History and present status (Preprints no. IT-03).** Stoll, Wolfgang. Department of Atomic Energy, Bombay (India). Among the four types of fuels discussed in this paper, the mixed oxide is the best developed. While this fuel may be adequate for the near future, it cannot fully exploit the advantages of the breeder reactor technology. There is enough information available to design a carbide fuel, but for high burn up application much development work is called for. Reprocessing experience is also lacking. There is less data on the nitride fuel, but it appears to be free of some of the disadvantages of the carbide fuel. For example, it dissolves readily in nitric acid and hence is amenable to aqueous reprocessing methods. The nitride fuel is being pursued in Europe. The metallic fuel is actively under development in USA. Its advantages are high breeding gain, passive safety features and short fuel cycle through pyrochemical reprocessing. These features have to be demonstrated in a full fuel cycle before metallic fuels are fully accepted. (author). 36 refs., 5 tabs., 5 figs.

6604 (KFK–4736) **KfK, Institute for Reactor Components. Results of research and development activities in 1989.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Reaktorbauelemente. Mar 1990. 25p. (In German). Order Number DE92759306. Source: OSTI; NTIS (US Sales Only); INIS.

R and D activities at IRB (Institut fuer Reaktorbauelemente - Institute for Reactor Components) are dedicated to thermodynamics and fluid dynamics. Emphasis is on the design of nuclear reactor and fusion reactor components. Environmental engineering was added recently. Most activities are applications-oriented. Fundamental investigations focus on energy research and energy technology. The activities are carried out in the framework of different projects (PKF/nuclear fusion, PSF/nuclear safety, PSU/pollution control). Points of main effort are the development of basic liquid-metal-cooled blanket solutions, investigations on natural convection in reactor tanks, and the cooling properties of future containments for pressurized water reactors in the case of nuclear fusion accidents. (orig./GL).

6605 (MIT-ANP-TR–001) **The role of actinide burning and the Integral Fast Reactor in the future of nuclear power.** Hollaway, W.R.; Lidsky, L.M.; Miller, M.M. Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Nuclear Engineering. Dec 1990. 162p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-76OR00033 ;W-31109-ENG-38. Order Number DE92004771. Source: OSTI; NTIS; INIS; GPO Dep.

A preliminary assessment is made of the potential role of actinide burning and the Integral Fast Reactor (IFR) in the future of nuclear power. The development of a usable actinide burning strategy could be an important factor in the acceptance and implementation of a next generation of nuclear power. First, the need for nuclear generating capacity is established through the analysis of energy and electricity demand forecasting models which cover the spectrum of bias from anti-nuclear to pro-nuclear. The analyses take into account the issues of global warming and the potential for technological advances in energy efficiency. We conclude, as do many others, that there will almost certainly be a need for substantial nuclear power capacity in the 2000–2030 time frame. We point out also that any reprocessing scheme will open up proliferation-related questions which can only be assessed in very specific contexts. The focus of this report is on the fuel cycle impacts of actinide burning. Scenarios are developed for the deployment of future nuclear generating capacity which exploit the advantages of actinide partitioning and actinide burning. Three alternative reactor designs are utilized in these future scenarios: The Light Water Reactor (LWR); the Modular Gas-Cooled Reactor (MGR); and the Integral Fast Reactor (FR). Each of these alternative reactor designs is described in some detail, with specific emphasis on their spent fuel streams and the back-end of the nuclear fuel cycle. Four separation and partitioning processes are utilized in building the future nuclear power scenarios: Thermal reactor spent fuel preprocessing to reduce the ceramic oxide spent fuel to metallic form, the conventional PUREX process, the TRUEX process, and pyrometallurgical reprocessing.

2106 Power Reactors, Mobile, Propulsion, Package, and Transportable

6606 (EGG-M-91428) **Cost effective development of a nuclear thermal rocket engine (NTRE).** Leyse, C.F. (Leyse (C.F.), Idaho Falls, ID (United States)); Ramsthaler, J.H.; Culver, D.W.; Haloulakos, V.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-9109226-25: AIAA/NASA/OAI conference on advanced space exploration initiative (SEI) technologies, Cleveland, OH (United States), 3-4 Sep 1991). Order Number DE92003320. Source: OSTI; NTIS (US Sales Only); GPO Dep.

It is proposed that the development of a small, low thrust engine is a cost effective approach to the development of an NTRE and that an early version of such an engine could be available for a flight test program by the year 2000. The development of a low thrust (e.g. 2000-5000 lbf engine can utilize existing, upgraded and modified development and test facilities, thus avoiding the large up-from cost of the very large facilities required for testing high thrust (e.g. $\geq$ 75,000 lbf) NTREs. Near term (T_c= 2500 K) and advanced T_c= 32000 K) versions of a high pressure (P_c = 500 psia) and a low pressure (P_c = 50 psia) NTRE are described and mission performance evaluated for a typical space mission involving the potential payload to GEO assuming a Titan IV launch of 40 klbm to LEO. Potential payloads of the advanced engine are approximately 50% greater than the payload of high performance LOX-hydrogen chemical engines. The low pressure engine is indicated to out-perform the high pressure concept. Clustering of eight to sixteen 5000 lbf thrust engines may be feasible and would provide sufficient thrust for human missions to Mars, thereby eliminating the costly and time consuming development of a high thrust NTRE. Considering the differences in costs of test facilities, test engines, engine ground and flight testing and deployment date, the low thrust engine could result in savings of several billions dollars compared to development of a high (e.g. 75,000 lbf) engine. 8 refs., 11 figs., 5 tabs.

6607 (EGG-M-91485) **Comet Riders-Nuclear nomads to the stars.** Angelo, J.A. Jr. (Science Applications International Corp., Melbourne, FL (United States)); Buden, D. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-9110217-5: 42. International Aeronautical Federation Congress (IAEFC), Montreal (Canada), 7-11 Oct 1991). Order Number DE92003287. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the potential role of an evolutionary family of advanced space nuclear power systems (solid core reactor, gas core reactor, and thermonulcear fusion systems) in the detailed exploration of Solar System comets and in the use of interstellar comes to support migratory journeys to the stars by both human beings and their smart robot systems. 14 refs., 5 figs., 2 tabs.

Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-9109226-22: AIAA/NASA/OAI conference on advanced space exploration initiative (SEI) technologies, Cleveland, OH (United States), 3-4 Sep 1991). Order Number DE92002514. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Los Alamos Critical Experiments Facility (LACEF) played a central role in the Rover design and development process. This paper illustrates the iterative nuclear design and development process used during the Rover space nuclear reactor propulsion program and reviews the role played by critical experiments performed at the LACEF. 13 refs., 5 figs., 1 tab.

6609 (SAND-91-2315C) **Nuclear Thermal Propulsion test facility requirements and development strategy.** Allen, G.C. (Sandia National Labs., Albuquerque, NM (United States)); Warren, J.; Clark, J.S.; Perkins, D.R.; Martinell, J. Sandia National Labs., Albuquerque, NM (United States). 18 Oct 1991. 12p. Sponsored by U.S. DOE Nuclear Energy; U.S. Department of Defense; National Aeronautics and Space Administration. DOE Contract AC04-76DP00789. (CONF-920104-18: 9. symposium on space nuclear power systems, Albuquerque, NM (United States), 13-16 Jan 1992). Order Number DE92002923. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Nuclear Thermal Propulsion (NTP) subpanel of the Space Nuclear Propulsion Test Facilities Panel evaluated facility requirements and strategies for nuclear thermal propulsion systems development. High pressure, solid core concepts were considered as the baseline for the evaluation, with low pressure concepts an alternative. The work of the NTP subpanel revealed that a wealth of facilities already exists to support NTP development, and that only a few new facilities must be constructed. Some modifications to existing facilities will be required. Present funding emphasis should be on long-lead-time items for the major new ground test facility complex and on facilities supporting nuclear fuel development, not hydrogen flow test facilities, and low power critical facilities.

6610 (WHC-SA-1402) **Nuclear electric propulsion development and qualification facilities.** Dutt, D.S. (Westinghouse Hanford Co., Richland, WA (United States)); Thomassen, K.; Sovey, J.; Fontana, M. Westinghouse Hanford Co., Richland, WA (United States). Nov 1991. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-920104-23: 9. symposium on space nuclear power systems, Albuquerque, NM (United States), 13-16 Jan 1992). Order Number DE92004262. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This paper summarizes the findings of a Tri-Agency panel; consisting of members from the National Aeronautics and Space Administration (NASA), US Department of Energy (DOE), and US Department of Defense (DOD); charged with reviewing the status and availability of facilities to test components and subsystems for megawatt-class nuclear electric propulsion (NEP) systems. The facilities required to support development of NEP are available in NASA centers, DOE laboratories, and industry. However, several key facilities require significant and near-term modification in order to perform the testing required to meet a 2014 launch date. For the higher powered Mars cargo and piloted missions, the priority established for facility preparation is: (1) thruster developmental testing facility, (2) thruster lifetime testing facility, (3) dynamic energy conversion development and demonstration facility, and (4) advanced reactor testing facility (if required to demonstrate an advanced multiwatt power system). Facilities to support development of the power conditioning and heat rejection subsystems are available in industry, federal laboratories, and universities. In addition to the development facilities, a new preflight qualifications and acceptance testing facility will be required to support the deployment of NEP systems for precursor, cargo, or piloted Mars missions. Because the deployment strategy for NEP involves early demonstration missions, the demonstration of the SP-100 power system is needed by the early 2000s.

2107 Regulation and Licensing

6611 (INIS-GB-389) **Licensing reform in the USA: A review.** ERC Environmental and Energy Services Co., Fairfax, VA (United States). Jan 1991 229p. Order Number DE92615175. Source: OSTI; NTIS (US Sales Only); INIS.

The licensing process for nuclear power plants in the USA is currently in two distinct stages: the issuance of a construction permit followed later by the issuance of an operation license. The "two-step" process has come under heavy criticism from the U.S. nuclear industry on the grounds that it causes uncertainty and delays and therefore inhibits new commitments to nuclear power plants. In 1989 the NRC published new regulations for the licensing of nuclear power plants which provide for the issuance of early site permits, safety certifications of standard designs, and combined construction permits and operating licences. The new rule was challenged by intervenors representing antinuclear groups who filed a legal challenge seeking to have the rule set aside on the grounds that it violates the Atomic Energy Act which they allege makes two-step licensing mandatory. In November 1990 the US Court of Appeals upheld the NRC's authority to issue combined licenses. An appeal for a rehearing has been filed. The paper analyses the events and the possible consequences of an adverse court decision. It reviews the options open to the NRC and industry if the court decision is upheld. The possibility of congressional action to amend the Atomic Energy Act is discussed. (author).

6612 (NUREG–0304-Vol.16-No.2) **Regulatory and technical reports (abstract index journal): Compilation for second quarter 1991, April–June: Volume 16, No. 2.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Nov 1991. 44p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This journal includes all formal reports in the NUREG series prepared by the NRC staff and contractors; proceedings of conferences and workshops; as well as international agreement reports. The entries in this compilation are indexed for access by title and abstract, secondary report number, personal author, subject, NRC organization for staff and international agreements, contractor, international organization, and licensed facility.

6613 (NUREG–0750-Vol.34-No.3) **Nuclear Regulatory Commission issuances: Volume 43, No. 3.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Sep 1991. 52p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judges (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM).

6614 (NUREG–0750-Vol.34-No.4) **Nuclear Regulatory Commission issuances: Volume 34, No. 4.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Oct 1991. 36p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judges (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM).

6615 (NUREG–0936-Vol.10-No.3) **NRC Regulatory Agenda: Quarterly report, July–September 1991: Volume 10, No. 3.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Oct 1991. 124p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

The NRC Regulatory Agenda is a compilation of all rules on which the NRC has recently completed action, or has proposed action, or is considering action, and all petitions for rulemaking which have been received by the Commission and are pending disposition by the Commission. The Regulatory Agenda is updated and issued each quarter.

6616 (NUREG–0940-Vol.10-No.3) **Enforcement actions: Significant actions resolved: Quarterly progress report, July–September 1991: Volume. 10, No. 3.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Enforcement. Nov 1991. 215p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This compilation summarizes significant enforcement actions that have been resolved during one quarterly period (July–September 1991) and includes copies of letters, Notices, and Orders sent by the Nuclear Regulatory Commission to licensees with respect to these enforcement actions. It is anticipated that the information in this publication will be widely disseminated to managers and employees engaged in activities licensed by the NRC, so that actions can be taken to improve safety by avoiding future violations similar to those described in this publication.

6617 (NUREG–1362) **Regulatory analysis for final rule on nuclear power plant license renewal: Final report.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution. Dec 1991. 190p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This regulatory analysis provides the supporting information for the final rule (10 CFR Part 54) that defines the Nuclear Regulatory Commission's requirements for renewing the operating licenses of commercial nuclear power plants. A set of four specific alternatives for the safety review of license renewal applications is defined and evaluated. These are: Alternative A-current licensing basis; Alternative B-extension of Alternative A to require assessment and managing of aging; Alternative C – extension of Alternative B to require assessment of design differences against selected new-plant standards using probabilistic risk assessment; and Alternative D – extension of Alternative B to require compliance with all new-plant standards. A quantitative comparison of the four alternatives in terms of impact-to-value ratio is presented, and Alternative B is the most cost-beneficial safety review alternative.

6618 (NUREG–1363-Vol.3) **Atomic Safety and Licensing Board Panel annual report: Fiscal year 1990: Volume 3.** Nuclear Regulatory Commission, Washington, DC (United States). Sep 1991. 24p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

In Fiscal Year 1990, The Atomic Safety and Licensing Board Panel (Panel) handled 40 proceedings involving the construction, operation, and maintenance of commercial nuclear power reactors or other activities requiring a license from the Nuclear Regulatory Commission. This report summarizes, highlights, and analyzes how the judges and licensing boards of the Panel addressed the wide-ranging issues raised in these proceedings during the year.

6619 (NUREG–1398) **Environmental assessment for final rule on nuclear power plant license renewal: Final report.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution. Dec 1991. 47p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

The Atomic Energy Act and Nuclear Regulatory Commission (NRC) regulations provide for the renewal of nuclear power plant operating licenses beyond their initial 40-year term. The Act and NRC regulations, however, do not specify the procedures, criteria, and standards that must be satisfied in order to renew a license. The NRC is promulgating a rule (10 CFR Part 54) to codify such requirements prior to the receipt of applications for license renewal. The NRC has assessed the possible environmental effects of promulgating requirements in 10 CFR Part 54 now rather than employing such requirements in an ad hoc manner in individual licensing actions. The final part 54 rule requires the development of information and analyses to identify aging problems of systems, structures, and components unique to license renewal that will be of concern during the period of extended operation and will not be controlled by existing effective programs. In general, licensee activities for license renewal may involve replacement, refurbishment, inspection, testing, or monitoring. Such actions will be generally be within the range of similar actions taken for plants during the initial operating term. These actions would be primarily confined within the plants with potential for only minor disruption to the environment. It is unlikely that these actions would change the operating conditions of plants in ways that would change the environmental effects already being experienced. Relicensing under existing regulations would also be primarily focused on aging degradation and would likely result in requirements similar to those that will result from relicensing under the final rule.

6620 (NUREG–1412) **Foundation for the adequacy of the licensing bases: A supplement to the statement of considerations for the rule on nuclear power plant license renewal (10 CFR Part 54): Final report.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Dec 1991. 109p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

The objective of this report is to describe the regulatory processes that assures that any plant-specific licensing bases will provide reasonable assurance that the operation of nuclear power plants will not be inimical to the public health and safety to the end of the renewal period. It is on the adequacy of this process that the Commission has determined that a formal renewal licensing review against the full range of current safety requirements would not add significantly to safety and is not needed to assure that continued operation throughout the renewal term is not inimical to the public health and safety or common defense and security. This document illustrates in general terms how the regulatory process has evolved in major safety issue areas. It also provides examples illustrating why it is unnecessary to re-review an operating plant's basis, except for age-related degradation unique to license renewal, at the time of license renewal. The report is a supplement to the Statement of Considerations for the Nuclear Regulatory Commission's rule (10 CFR Part 54) that established the criteria and standards governing nuclear power plant license renewal.

6621 (NUREG–1428) **Analysis of public comments on the proposed rule on nuclear power plant license renewal.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution. Dec 1991. 360p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This report provides a summary and analysis of public comments on the proposed license renewal rule for the nuclear power plants (10 CFR Part 54) published in the Federal Register on 17 July 1990. It also documents the NRC's resolution of the issues raised by the commenters. Comments from 121 organizations and 76 individuals were reviewed and analyzed to identify the issues, including those pertaining to the adequacy of the licensing basis, the performance of an integrated plant assessment, backfit considerations, and need for public hearings. The analysis included grouping of commenters' views according to the issues raised. The public comments analyzed in this report were taken into consideration in the development of the final rule and revisions to the supporting documents.

6622 (NUREG/CR–2000-Vol.10-No.9) **Licensee Event Report (LER) compilation for month of September 1991.** Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data; Oak Ridge National Lab., TN (United States). Nuclear Operations Analysis Center. Oct 1991. 87p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. (ORNL/NSIC–200-Vol.10-No.9). Source: OSTI; NTIS; INIS.

This monthly report contains Licensee Event Report (LER) operational information that was processed into the LER data file of the Nuclear Safety Information Center (NSIC) during the one month period identified on the cover of the document. The LERs, from which this information is derived, are submitted to the Nuclear Regulatory Commission (NRC) by nuclear power plant licensees in accordance with federal regulations. Procedures for LER reporting for revisions to those events occurring prior to 1984 are described in NRC Regulatory Guide 1.16 and NUREG-0161, Instructions for Preparation of Data Entry Sheets for Licensee Event Reports. For these events occurring on and after January 1, 1984, LERs are being submitted in accordance with the revised rule contained in Title 10 Part 50.73 of the Code of Federal Regulations (10 CFR 50.73 – Licensee Event Report System) which was published in the Federal Register (Vol. 48, No. 144) on July 26, 1983. NUREG-1022, Licensee Event Report System – Description of Systems and Guidelines for Reporting, provides supporting guidance and information on the revised LER rule. The LER summaries in this report are arranged alphabetically by facility name and then chronologically by event data for each facility. Component, system, keyword, and component vendor indexes follow the summaries. Vendors are those identified by the utility when the LER form is initiated; the keywords for the component, system, and general keyword indexes are assigned by the computer using correlation tables from the Sequence Coding and Search System.

6623 (NUREG/CR–2000-Vol.10-No.10) **Licensee Event Report (LER) compilation for the month of October 1991: Volume 10, No.10.** Oak Ridge National Lab., TN (United States); Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data. Nov 1991. 138p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. (ORNL/NSIC–200-Vol.10-No.10). Source: OSTI; NTIS; INIS; GPO.

This monthly report contains Licensee Event Report (LER) operational information that was processed into the LER data file of the Nuclear Safety Information Center (NSIC) during the one month period identified on the cover of the document. The LERs, from which this information is derived, are submitted to the Nuclear Regulatory Commission (NRC) by nuclear power plant licensees in accordance with federal regulations. Procedures for LER reporting for revisions to those events occurring prior to 1984 are described in NRC Regulatory Guide 1.16 and NUREG-0161, Instructions for Preparation of Data Entry Sheets for Licensee Event Reports. For those events occurring on and after January 1, 1984, LERs are being submitted in accordance with the revised rule contained in Title 10 Part 50.73 of the Code of Federal Regulations (10 CFR 50.73 – Licensee Event Report System) which was published in the Federal Register (Vol. 48, No. 144) on July 26, 1983. NUREG-1022, Licensee Event Report System – Description of Systems and Guidelines for Reporting, provides supporting guidance and information on the revised LER rule. The LER summaries in this report are arranged alphabetically by facility name and then chronologically by event date for each facility. Component, system, keyword, and component vendor indexes follow the summaries. Vendors are those identified by the utility when the LER form is initiated; the keywords for the component, system, and general keyword indexes are assigned by the computer using correlation tables from the Sequence Coding and Search System.

6624 (WHC-SA–1266-Rev.1) **Resolving the problem of compliance with the ever increasing and changing regulations: Revision 1.** Leigh, H. Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 8p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-920104–3-Rev.1: 9. symposium on space nuclear power systems, Albuquerque, NM (United States), 13-16 Jan 1992). Order Number DE92003629. Source: OSTI; NTIS; INIS; GPO Dep.

The most common problem identified at several US Department of Energy (DOE) sites is regulatory compliance. Simply, the project viability depends on identifying regulatory requirements at the beginning of a specific project to avoid possible delays and cost overruns. The Radioisotope Power Systems Facility (RPSF) is using the Regulatory Compliance System (RCS) to deal with the problem that well over 1000 regulatory documents had to reviewed for possible compliance requirements applicable to the facility. This overwhelming number of possible documents is not atypical of all DOE facilities thus far reviewed using the RCS system. The RCS was developed to provide control and tracking of all the regulatory and institutional requirements on a given project. WASTREN, Inc., developed the RCS through various DOE contracts and continues to enhance and update the system for existing and new contracts. The RCS provides the information to allow the technical expert to assimilate and manage accurate resource information, compile the necessary checklists, and document that the project or facility fulfills all of the appropriate regulatory requirements. The RCS provides on-line information, including status throughout the project life, thereby allowing more intelligent and proactive decision making. Also, consistency and traceability are provided for regulatory compliance documentation. 1 ref., 1 fig.

Nuclear power occupies about 50% of the total power generation and it will still play a crucial role in the future in Korea. The purpose of this study is to confirm importance of the role of nuclear power generation in energy self-reliance by suggesting an optimal plant mix through consistent and systematic derivation of data on electricity power plant. This study explores the effect of standardization of nuclear power plants in Korea and its influence on long-term electric system expansion planning(ESEP). Efforts are made to improve the applications of methodologies and to clarify some important concepts currently using in ESEP. And it is suggested to lower 8% of real discount rate, which is used currently, in order to reflect risk-free investment of electricity business. (Author).

6626 (KAERI/RR–975/90) **The development status and survey of the technical data for nuclear district heating reactors.** Kwack, Eun Ho (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Lee, Jeong Young; Lee, Jae Han; Lee, Hyong Yeun; Koo, Gyeong Hoi. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1991. 105p. (In Korean). Order Number DE92615035. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of the study presented is to reserve the basis for the design and construction of a 10MWt NDHR in KAERI site after surveying and analyzing the development status and the technical data for the NDHR under operation and development in the world. The results of the study are that the verification tests of the performance and the safety for the components and systems composing the reactor are required because the NDHR, for the most part, are under development stage except some reactors. Concerning with the design and construction of a NDHR in Korea, it seems to be desirable that the selection of the reactor and the co-work with a foreign country should be performed after reviewing the technical characteristics, safety, economy and the possibility of domestic production of NDHR in depth. Additionally as the regulation and licensing for the NDHR are not established yet except for some countries, it is required that the work concerning with the regulation and licensing should be performed at the sometime. 6627 (FASAC-TAR-92003807) **West European nuclear power generation research and development.** Turinsky, P.J.; Baron, S.; Burch, W.D.; Corradini, M.L.; Lucas, G.E.; Matthews, R.B.; Uhrig, R.E. Science Applications International Corp., McLean, VA (United States). Foreign Applied Sciences Assessment Center. Sep 1991. 364p. Source: OSTI; Science Applications International Corp., 1710 Goodridge Dr., P.O. Box 1303, McLean, VA 22102.

This report assesses the status of West European research and development (R&D) in support of nuclear power generation. The focus is on light-water reactors (LWRs), as they will likely be the only concept commerically implemented within the next decade. To a laser degree, alternative concepts such as the high-temperature gas cooled reactor and the liquid-metal reactor (LMR) are also assessed. To bound the study, only the fuel cycle stages of fuel fabrication, power generation, and fuel reprocessing are considered. Under the topic of power generation, the subtopics of core reactor physics, materials, instrumentation and control systems, nuclear power safety, and power plant fabrication and construction are addressed. The front-end fuel cycle stages of mining and milling, conversion and enrichment, and the back-end fuel cycle stages of waste conditioning and disposal and not considered. Most assessments for light-water reactor R&D are completed on a country-by-country basis since there is limited cooperation among the West European countries due to the commercial relevance of R&D in this area.

6629 (DOE/ER/12888–T1) **A semi-experimental nodal synthesis method for the on-line reconstruction of three-dimensional neutron flux-shapes and reactivity: Final report.** Jacqmin, R.P. Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Nuclear Engineering. 10 Dec 1991. 529p. Sponsored by U.S. DOE Energy Research. DOE Contract FG07-89ER12888. Order Number DE92004450. Source: OSTI; NTIS; INIS; GPO Dep.

The safety and optimal performance of large, commercial, light-water reactors require the knowledge at all time of the neutron-flux distribution in the core. In principle, this information can be obtained by solving the time-dependent neutron diffusion equations. However, this approach is complicated and very expensive. Sufficiently accurate, real-time calculations (time scale of approximately one second) are not yet possible on desktop computers, even with fast-running, nodal kinetics codes. A semi-experimental, nodal synthesis method which avoids the solution of the time-dependent, neutron diffusion equations is described. The essential idea of this method is to approximate instantaneous nodal group-fluxes by a linear combination of K, precomputed, three-dimensional, static expansion-functions. The time-dependent coefficients of the combination are found from the requirement that the reconstructed flux-distribution agree in a least-squares sense with the readings of J ($\geq$K) fixed, prompt-responding neutron-detectors. Possible numerical difficulties with the least-squares solution of the ill-conditioned, J-by-K system of equations are brought under complete control by the use of a singular-value-decomposition technique. This procedure amounts to the rearrangement of the original, linear combination of K expansion functions into an equivalent more convenient, linear combination of R ($\leq$K) orthogonalized "modes" of decreasing magnitude. Exceedingly small modes are zeroed to eliminate any risk of roundoff-error amplification, and to assure consistency with the limited accuracy of the data. Additional modes are zeroed when it is desirable to limit the sensitivity of the results to measurement noise.

6632 (KFK–4850, pp. 179-210) **Development of calculational procedures for the neutron physics design of an APWR equilibrium core.** Broeders, C.H.M. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik). Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

The development of calculational procedures for the neutron physics design of an APWR equilibrium core with tight triangular fuel lattice is described. In the first section problems related to the following topics are discussed: calculation of infinite reactor zones, fuel depletion and burnup, reactor control, calculation of the fuel assemblies, calculation of the whole core and preparation and validation of data libraries. In the last section a new procedure with related libraries is presented. This program, ARCOSI, allows the simulation of an APWR-Core during an arbitrary number of cycles, including fuel assembly shuffling. (orig./DG).

Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

The experiments for the investigation of the physics of a Light Water High Conversion Reactor (LWHCR) at the PROTEUS reactor facility in Switzerland was terminated at the end of 1990. For the comparison - with results of cell calculations - of reaction rate ratios and k_∞ measured in these LWHCR lattice experiments, a number of correction factors was calculated using data and methods available at KfK. The calculation of correction factors for PROTEUS experiments is described and some results of cell calculations are compared with measured reaction rate ratios and k_∞. It is shown that k_∞ values of most LWHCR lattices can be predicted within the experimental error limit using codes and nuclear data developed at KfK for LWHCR studies. Larger discrepancies still exist between calculated and measured reaction rate ratios. (orig./DG).

6634 (PSI–107) **EFF1LIB: a NJOY generated neutron data library based on EFF-1 for the continuous energy Monte Carlo code MCNP.** Vontobel, P. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1991. 50p. Order Number DE92613777. Source: OSTI; NTIS (US Sales Only); INIS.

EFF1LIB is a fast neutron data library for the Los Alamos continuous energy Monte Carlo Code MCNP. The library contains cross section data for 69 - light and structural material - isotopes mainly from the EFF-1 evaluation in the energy range 10^{-5} EV to 20 MeV. Isotopes of the following chemical elements are included: H, He, Li, Be, B, C, N, O, F, Na, Mg, Al, Si, P, S, Cl, Ar, K, Ca, Sc, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zr, Nb, Mo, Ag, Cd, In, Sn, Xe, Cs, Ba, Sm, Hf, Ta, W, Pb and Bi. An index to this library together with plots of the total cross sections and the local prompt neutron heating values is presented. The generation of the library wigh NJOY is described. (author) figs., 3 tabs., 9 refs.

6635 (WHC-EP–0435) **1DB, a one-dimensional diffusion code for nuclear reactor analysis.** Little, W.W. Jr. (Pacific Northwest Lab., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 102p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. Order Number DE92003020. Source: OSTI; NTIS; INIS; GPO Dep.

1DB is a multipurpose, one-dimensional (plane, cylinder, sphere) diffusion theory code for use in reactor analysis. The code is designed to do the following: To compute k_{eff} and perform criticality searches on time absorption, reactor composition, reactor dimensions, and buckling by means of either a flux or an adjoint model; to compute collapsed microscopic and macroscopic cross sections averaged over the spectrum in any specified zone; to compute resonance-shielded cross sections using data in the shielding factor format; and to compute isotopic burnup using decay chains specified by the user. All programming is in FORTRAN. Because variable dimensioning is employed, no simple restrictions on problem complexity can be stated. The number of spatial mesh points, energy groups, upscattering terms, etc. is limited only by the available memory. The source file contains about 3000 cards. 4 refs.

6636 (BNL–46745) **Locating of leaks in water-cooled generator stator bars using perfluorocarbon tracers.** Loss, W.M.; Dietz, R.N. Brookhaven National Lab., Upton, NY (United States). Sep 1991. 36p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE92005006. Source: OSTI; NTIS; GPO Dep.

Water cooled stator bars in power plant generators often fail during the maintenance cycle due to water leakage. After the hydrogen pressure in the generator shell has been released water can leak through cracks in the copper and through the insulation. Leaking bars, but not the leaks themselves, are detected with so-called "hi-pot" (high potential) tests where direct electrical current is applied to the stator bar windings. A study initiated by ConEd and Brookhaven's Tracer Technology Center to explore the cause of these leakage problems to determine if the failures originate in the manufacturing process or are created in service by phase related torque stresses. To this purpose bars that had failed the hi-pot test were investigated first with the insulation in place and then stripped to the bare copper. The bars were pressurized with gases containing perfluorocarbon tracers and the magnitude and location of the leaks was detected by using tracers technology principles and instruments such as the "double source" method and the Dual Trap Analyzer. In the second part of the project the windings within a generator were tested in-situ for leaks during an outage using tracer principles. Recommendations are given suggesting the shut down of stator bar cooling water before hydrogen bleeding during outages and a revision of the current vent flow rate. The new standard should establish a reasonable leak rate for the stator bar windings proper and exclude leakage of pump seals and connections. Testing during the maintenance cycle in generators should include routine tracer leak detection following the hi-pot test.

6637 (BNL-NUREG–46331) **Detecting and mitigating aging in component cooling water systems.** Lofaro, R.J. Brookhaven National Lab., Upton, NY (United States). [1991]. 13p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC02-76CH00016. (CONF-911079–17: 19. Nuclear Regulatory Commission (NRC) water reactor safety information meeting, Bethesda, MD (United States), 28-30 Oct 1991). Order Number DE92004989. Source: OSTI; NTIS; INIS; GPO Dep.

The time-dependent effects of aging on component cooling water (CCW) systems in nuclear power plants has been studied and documented as part of a research program sponsored by the US Nuclear Regulatory Commission. It was found that age related degradation leads to failures in the CCW system which can result in an increase in system unavailability, if not properly detected and mitigated. To identify effective methods of managing this degradation, information on inspection, monitoring, and maintenance practices currently available was obtained from various operating plants and reviewed. The findings were correlated with the most common aging mechanisms and failure modes and a compilation of aging detection and mitigation practices was formulated. This paper discusses the results of this work.

6638 (CONF-910808–7) **Effects of thermal aging and neutron irradiation on the mechanical properties of stainless steel weld overlay cladding.** Haggag, F.M.; Nanstad, R.K. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From 5. international symposium on environmental degradation on materials in nuclear power systems - water reactors; Monterey, CA (United States); 25-29 Aug 1991. Order Number DE92004443. Source: OSTI; NTIS; INIS; GPO Dep.

Stainless steel weld overlay cladding was fabricated using the three-wire, series-arc method. Three layers of cladding were applied to a pressure vessel plate to provide adequate thickness for fabrication of test specimens. Since irradiation of the stainless steel cladding to 5×10^{19} neutrons/cm^2 (>1 MeV) was conducted at 288°C for 1605 h, tensile, Charpy V-notch (CVN), precracked Charpy V-notch (PCVN), and compact fracture toughness specimens were thermally aged at 288°C for 1605 h. Additional specimens are being aged to 20,000 and 50,000 h. Thermal aging of three-wire, series-arc stainless steel weld overlay cladding at 288°C for 1604 h resulted in appreciable decrease (16%) in the

CVN upper-shelf energy, but the effect on the 41-J transition temperature shift was very small (3°C). The combined effect, following neutron irradiation at 288°C to a fluence of 5 x 10^{19} neutrons/cm^2 (>MeV), was a 22% reduction in the CVN upper-shelf energy and a 29°C shift at the 41-J level. The effect of thermal aging on tensile properties was very small or negligible. However, the combined effect after neutron irradiation was an increase in the yield strength (6 to 34% at test temperatures from 288 to −125°C) and no apparent change in ultimate strength and total elongation. Also, neutron irradiation reduced the initiation fracture toughness (J_{Ic}) much more than did thermal aging. However, irradiation slightly decreased the tearing modulus, but no reduction was caused by thermal aging alone. The effects of long-term thermal exposure times (20,000 and 50,000 h) will be investigated when the specimen become available.

6639 (CONF-9110236–2) **NRC data base for power reactor surveillance programs and for irradiation experiments results.** Kam, F.B.K.; Stallmann, F.W. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From Working group 3 Joint Coordinating Committee on Nuclear Reactor Safety (JCCNRS) meeting; Oak Ridge, TN (United States); 16-18 Oct 1991. Order Number DE92001687. Source: OSTI; NTIS; INIS; GPO Dep.

The radiation damage of pressure vessel materials in nuclear reactors depends on many different factors, primarily fluence, fluence spectrum, fluence rate, irradiation temperature, and chemistry. These factors and, possibly, others such as heat treatment and type of flux used in weldments must be considered to reliably predict the pressure vessel embrittlement and to assure the safe operation of the reactor. Based on embrittlement predictions, decisions must be made concerning operating parameters, low-leakage fuel management, possible life extension, and the need for annealing of the pressure vessel. Large numbers of data obtained from surveillance capsules and test reactor experiments are needed, comprising many different materials and different irradiation conditions, to develop generally applicable damage prediction models that can be used for industry standards and regulatory guides. The US Nuclear Regulatory Agency has, therefore, sponsored a project to construct an Embrittlement Data Base (EDB) for a comprehensive collection of data concerning changes in material properties of pressure vessel steels due to neutron irradiation. A first version containing data from surveillance capsules of commercial power reactors, the Power Reactor Embrittlement Data Base (PR-EDB) Version 1, has been completed and is available to authorized users from the Radiation Shielding Information Center at the Oak Ridge National Laboratory. This document provides a discussion of the features of the current database. 1 fig.

6640 (DOE/ER/12822–T1) **Avoiding water hammer/fluid transients in nuclear piping systems by controlled filling: Final report.** Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Mechanical Engineering. [1991]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG07-88ER12822. Order Number DE92004100. Source: OSTI; NTIS; INIS; GPO Dep.

A variety of geometries and operating procedures that lead to steam bubble collapse induced water hammers have been explored experimentally. Construction guidelines that will eliminate the problem at the design stage have been proposed and methods for predicting the pressure signatures proposed.

6641 (KAERI/RR–960/90) **The thermal-hydraulic characteristics of the nuclear reactor core during accident -an investigation on thermal mixing with direct vessel injection(II)-.** Cha, Jong Hee (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chung, Moon Ki; Won, Soon Yeon; Jun, Hyung Gil. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 134p. (In Korean). Order Number DE92615089. Source: OSTI; NTIS (US Sales Only); INIS.

It is investigated thermal and fluid mixing phenomena in situations relevant to pressurized thermal shock in the downcomer of a PWR during a cooldown transient caused by direct vessel injection(DVI). The test model was designed to simulate the typical values of prototype Combustion Engineering System 80+ by approximately factors of five. The test facility is consisted with water storage tanks, heating systems, pumps, and flowmeters needed to establish the required initial conditions and to run tests of sufficient duration to achieve steady fluid temperature through out the test vessel. Test measurements include flow rates, temperatures and pressures at the boundaries of the 1/5-scale model facility to characterize the test conditions, plus over 10 local measurements of temperature within the downcomer. Test data are recorded from all instruments simultaneously on a computer-based data acquisition system for the duration of each test. The tests were carried out to simulate two postulated accident conditions. The one was small-break loss-of-coolant accident(SBLOCA), and the other was steam line break(SLB). The results were compared with predicted values calculated with REMIX-code and COMMIX-code. The compared results could corroborate the trend of thermal and fluid mixing during cooldown transient with the result of visualization tests. Analysis of test results and predicted values may lead to the following conclusion. The fluid and thermal mixing pattern may be devided into three different regions, which are the flume flow region, the mixing developing region and fully mixed region. (Author).

6642 (KAERI/RR–971/90) **A study on the removal of dissolved oxygen from the secondary water in nuclear power plants.** Kim, Yong Eak (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Sung, Ki Woung; Bae, Jae Heum. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1991. 116p. (In Korean). Order Number DE92615090. Source: OSTI; NTIS (US Sales Only); INIS.

Catalyst fixed-bed method was studied for the dissolved oxygen(D.O.) removal in makeup water. Through experiments of a catalytic liquid-solid reactor and experimental data, its modelling, it is found that about 13 l Pd-catalyst based on hydrophobic polymer resin is required to reduce D.O. concentration of 10 l/min process water from 8000 ppb to below 10 ppb. Detail design of D.O. removal process employing polymer catalyst resin and hydrogen was carried out and a portable D.O. removal equipment was manufactured based on its design. This equipment was manufactured with treating capacity 10 l/min water and has shown a good performance of reducing D.O. concentration of 8 ppm in the water to below 10 ppb. As a result of investigation about the direct application of D.O. removal process to nuclear power plants, the condensate storage tank has been chosen as the most proper place for installation of D.O. removal equipment in nuclear power plants since the tank is located to directly influence water quality of reactor system and the equipment can be easily attached to the condensate tank without any major modification of existing plants. (Author).

6643 (PNL-SA–18065) **Mechanistic understanding of irradiation-induced corrosion of zirconium alloys in nuclear power plants: Stimuli, status, and outlook.** Johnson, A.B. Jr.; Ishigure, K.; Nechaev, A.F.; Reznichenko, E.A.; Cox, B.; Lemaignan, C.; Petrik, N.G. Pacific Northwest Lab., Richland, WA (United States). May 1990. 26p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-9005400–1: International Atomic Energy Agency (IAEA) conference, Alushta (USSR), 22-25 May 1990). Order Number DE92004516. Source: OSTI; NTIS; INIS; GPO Dep.

Failures in the basic materials used in nuclear power plants continue to be costly and insidious, despite increasing industry vigilance to catch failures before they degrade safety. For instance, the overall costs to the US industry from materials problems could amount to as much as $10 billion annually. Moreover, estimates indicate that the cost of a pipe failure in a nuclear plant is one hundred times greater than the cost of a similar failure in a coal-fired plant. There are important practical stimuli and much scope for further understanding of the effects of irradiation on Zr-alloys (and other materials used in nuclear installations) by careful experimentation. Moreover, these studies need to address the effect of irradiation on all components of heterogeneous systems: the metal, the oxide and the environment, and especially those processes recurring at the interphases between these components. The present paper is aimed at providing specialists with some systematic information on the subject and with important considerations on the key items for further experimentation.

6644 (PNL-SA–20093) **Snubber aging assessment: Results of NPAR Phase 2 in-plant research.** Blahnik, D.E. (Pacific Northwest Lab., Richland, WA (United States)); Werry, E.V.;

Brown, D.P. Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 11p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. (CONF-911079–4: 19. Nuclear Regulatory Commission (NRC) water reactor safety information meeting, Bethesda, MD (United States), 28-30 Oct 1991). Order Number DE92002736. Source: OSTI; NTIS; INIS; GPO Dep.

Snubbers are safety-related devices used to restrain undesirable dynamic loads at various piping and large equipment locations in nuclear power plants (NPPs). Snubbers are designed to accommodate normal thermal movements of a plant's operating systems or equipment and to be capable of restraining the maximum off-normal dynamic loads postulated for its specific location. Snubbers are subject to the effects of aging, and the factors that degrade their safety performance need to be better understood. This paper describes the US Nuclear Regulatory Commission (NRC) Phase 2 Nuclear Plant Aging Research (NPAR) in-plant aging study conducted to enhance the understanding of snubber aging, providing a basis to mitigate its consequences. The research methodology, results, recommendations, and conclusions are described in this paper. Recommendations for monitoring the service life of snubbers is a principal result of the research and will provide input to the American Society of Mechanical Engineers (ASME) Operations and Maintenance (OM) Code, Subsection ISTD. 5 refs., 4 figs.

Plutonium fuel fabrication in India was initiated nearly two decades ago when the core for the PURNIMA research reactor at BARC, consisting of SS 316 clad PuO_2 pins was prepared at Radiometallurgy Division (RMD). This was soon followed by fabrication of Al clad Al-Pu plate fuel elements and sub-assemblies, the experience of which was recently utilised for production of Al clad Al-23% Pu plate fuel subassemblies for PURNIMA III. During the last 15 years extensive research and development have been carried out on fabrication of plutonium bearing ceramic fuel pellets at RMD. The fuels developed so far include: (i) $(U,Pu)O_2$ and $(Th,PU)O_2$ containing upto 6% Pu for pressurised heavy water reactors (PHWR), (ii) mixed uranium plutonium oxide (MOX), monocarbide (MC) and mononitride (MN) containing between 20% and nearly 70% Pu for liquid metal cooled fast breeder reactors (LMFBR). A sophisticated carbide laboratory has been set up, where the fabrication of (Usub(0.3)Pusub(0.7))C fuel pellets and pins for the first core of fast breeder test reactor (FBTR) has been successfully completed. Presently, the facility is being utilised for development of MOX, MC and MN fuels for the forthcomming prototype fast breeder reactor (PFBR). Conventional powder-pellet and advanced sol-gel microsphere pelletisation (SGMP) processes have been developed for fabrication of MOX, MC and MN pellets. (author). 15 refs., 3 tabs., 12 figs.

6646 (INIS-mf–13025 vp.) **Chemical behavior of fission product iodine in irradiated oxide fuel pins for nuclear reactors (Preprint no. IT-15).** Yamawaki, M. (Tokyo Univ. (Japan). Faculty of Engineering); Konashi, Kenji. Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. Feb 1991. 685p. (CONF-9102132–: International symposium on radiochemistry and radiation chemistry - plutonium 50, Bombay (India), 4-7 Feb 1991). This review summarizes theoretical and experimental studies of CsI radiolysis in an operating fuel pin. From this review, it is concluded that the radiation effect is important for the understanding of chemical behavior of iodine in operating fuel pins. (author). 19 refs., 2 tabs., 4 figs.

6647 (KAERI-II/RR–22/90) **Decontamination and restoration technology development.** Oh, Won Zin (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Won, Hui Zun; Kim, Hong Pyo; Jung, Chong Hun; Moon, Jei Kwon; Park, Sang Yun; Shim, Jun Bo; Choi, Wang Kyu; Jun, Yong Bum; Yoo, Kil Seong. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Apr 1991. 421p. (In Korean). Order Number DE92614813. Source: OSTI; NTIS (US Sales Only); INIS.

This study is to develop a chemical decontamination technology applicable in a high radiation field such as spent fuel decontamination. A new decontamination formulation was developed in this study by adding ascorbic acid into the existing KAERI chemicals mainly consisting of EDTA and citric acid showed remarkable improvement in dissolution rate of nickel ferrite particles which were hard to be removed by conventional chemical decontamination reagents. The decontamination process development using the reagent was also carried out in this study. The hot loop decontamination tests using the specimens of Inconel-600 and SUS-304 contacted with the pressure boundary of primary coolant in Kori Unit 1 showed high decontamination factors which is as good as or even better than those of foreign processes such as LOMI and CAN-DECON. The decontamination test using spent fuel rod in Kori Unit 1 resulted in almost complete removal of crud from the rod surface. The material damages measured by corrosion surveilance specimen were very small and no localized corrosion were detected. The catalytic wet oxidation behaviors were also studied to decompose decontamination wastes. The Fe(II) catalyst was found to be effective. (Author).

6648 (KAERI/RR–938/90) **A study on the laser welding of aluminium for end-capping of KMRR fuel elements.** Kim, Cheol Jung (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Jung, Chin Man; Kim, Soo Sung; Kim, Jeong Moog; Kim, Min Suk; Kim, Kwang Suk; Kim, Duk Hyeon. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 105p. (In Korean). Order Number DE92615092. Source: OSTI; NTIS (US Sales Only); INIS.

The selecting of proper welding process for aluminum end-capping of KMRR nuclear fuel elements is considered important in respect to the soundness of weldments and the improvement of the performance of nuclear fuels during the operation in reactor. The aluminum end-caps of KMRR nuclear fuels are welded and sealed up circumferentially, connecting end-capping and U-Si-Al fuel rod core. This study is to investigate the characteristics of the laser welded specimen and make some samples for the end-cap welding of KMRR nuclear fuels. Also, the materials principles and theories for the laser welding of aluminum were analyzed and reviewed. In order to prevent aluminum materials from the weld defects, it is required that laser power density is slightly higher than that of the threshold for the plasma generation. Especially it can be also seen that the helium gas is more effective than argon gas to decrease porosity. (Athor).

6649 (KAERI/RR–942/90) **Development of post-irradiation examination and evaluation techniques for nuclear reactor fuel.** Ro, Seong Gy (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Eun Ka; Min, Duck Kee. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Dec 1990. 242p. (In Korean). Order Number DE92615093. Source: OSTI; NTIS (US Sales Only); INIS.

Fuels discharged from the KORI-1 nuclear power plant have been subjected to hot-cell examination at the post-irradiation examination facility of the Korea Atomic Energy Research Institute. The main objectives were to increase the technical depth of the post-irradiation examination (PIE) and evaluation, and to prepare systemic data base of the irradiation behavior for pressurized water reactor fuels. The examination items include a visual inspection, a dimensional measurement, and a gamma-scanning for the fuel assembly in pool. The hot-cell examination items for the fuel rod are a visual inspection, a profilometry, an axial gamma-scanning, an eddy current testing, a X-ray radiography, a fission gas collection, and its chemical composition analysis, a metallography, a ceramography, a micro gamma-scanning, a densimetry, and a burnup measurement by the chemical analysis method. The in-core fuel behavior parameters, such as a fuel rod/stack length change, a rod internal pressure change, a fission gas release rate, a cladding corrosion, fuel rod creep and growth, and a burnup, have been determined experimentally and compared with the predicted values by means of computer codes. It is appeared that the predicted values are well agreeable with the experimental results, except that for the fuel rod growth. (Author).

6650 **Critical heat flux test apparatus.** Welsh, R.E.; Doman, M.J.; Wilson, E.C. To Dept. of Energy. 1990. Filed date 31 May 1990. USA Patent patent application 7-531,355. 14p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC11-76PN00014. Order Number DE92003661. Source: OSTI; NTIS; GPO Dep.

An apparatus for testing, in situ, highly irradiated specimens at high temperature transients is provided. A specimen, which has a thermocouple device attached thereto, is manipulated into test position in a sealed quartz heating tube by a robot. An induction coil around a heating portion of the tube is powered by a radio frequency generator to heat the specimen. Sensors are connected to monitor the temperatures of the specimen and the induction coil. A quench chamber is located below the heating portion to permit rapid cooling of the specimen which is moved into this quench chamber once it is heated to a critical temperature. A vacuum pump is connected to the apparatus to collect any released fission gases which are analyzed at a remote location.

6651 (CONF-920308-3) **Development of High Flux Isotope Reactor (HFIR) subcriticality monitoring methods.** Rothrock, R.B. Oak Ridge National Lab., TN (United States). [1991]. 10p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. From Advances in reactor physics; Charleston, SC (United States); 8-11 Mar 1992. Order Number DE92001957. Source: OSTI; NTIS; INIS; GPO Dep.

Use of subcritical source multiplication measurements during refueling has been investigated as a possible replacement for out-of-reactor subcriticality measurements formerly made on fresh HFIR fuel elements at the ORNL Critical Experiment Facility. These measurements have been used in the past for preparation of estimated critical rod positions, and as a partial verification, prior to reactor startup, that the requirements for operational shutdown margin would be met. Results of subcritical count rate data collection during recent HFIR refuelings and supporting calculations are described illustrating the intended measurement method and its expected uncertainty. These results are compared to historical uses of the out-of-reactor core measurements and their accuracy requirements, and a planned in-reactor test is described which will establish the sensitivity of the method and calibrate it for future routine use during HFIR refueling. 2 refs., 1 fig., 2 tabs.

6652 (CONF-920308-6) **Monitoring nuclear reactor systems using neural networks and fuzzy logic.** Ikonomopoulos, A. (Tennessee Univ., Knoxville, TN (United States)); Tsoukalas, L.H.; Uhrig, R.E.; Mullens, J.A. Oak Ridge National Lab., TN (United States). [1991]. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Advances in reactor physics; Charleston, SC (United States); 8-11 Mar 1992. Order Number DE92003406. Source: OSTI; NTIS; INIS; GPO Dep.

A new approach is presented that demonstrates the potential of trained artificial neural networks (ANNs) as generators of membership functions for the purpose of monitoring nuclear reactor systems. ANN's provide a complex-to-simple mapping of reactor parameters in a process analogous to that of measurement. Through such "virtual measurements" the value of parameters with operational significance, e.g., control-valve-disk-position, valve-line-up or performance can be determined. In the methodology presented the output of a virtual measuring device is a set of membership functions which independently represent different states of the system. Utilizing a fuzzy logic representation offers the advantage of describing the state of the system in a condensed form, developed through linguistic descriptions and convenient for application in monitoring, diagnostics and generally control algorithms. The developed methodology is applied to the problem of measuring the disk position of the secondary flow control valve of an experimental reactor using data obtained during a start-up. The enhanced noise tolerance of the methodology is clearly demonstrated as well as a method for selecting the actual output. The results suggest that it is possible to construct virtual measuring devices through artificial neural networks mapping dynamic time series to a set of membership functions and thus enhance the capability of monitoring systems. 8 refs., 11 figs., 1 tab.

6653 (DOE/ER/12809-4) **The slightly-enriched spectral shift control reactor: Final report, September 30, 1988–September 30, 1991.** Martin, W.R. (Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering); Lee, J.C.; Larsen, E.W.; Edlund, M.C. Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering. Nov 1991. 75p. Sponsored by U.S. DOE Energy Research. DOE Contract FG07-88ER12809. Order Number DE92004026. Source: OSTI; NTIS; INIS; GPO Dep.

An advanced converter reactor design utilizing mechanical spectral shift control rods in a conventional pressurized water reactor configuration is under investigation. The design is based on the principle that a harder spectrum during the early part of the fuel cycle will result in large neutron captures in fertile ^{238}U, which can then be burned in situ in a softer spectrum later in the cycle. Preliminary design calculations performed during FY 89 showed that the slightly-enriched spectral shift reactor design offers the benefit of substantially increased fuel resource utilization with the proven safety characteristics of the pressurized water reactor technology retained. Optimization of the fuel design and development of fuel management strategies were carried out in FY 90, along with effort to develop and validate neutronic methodology for tight-lattice configurations with hard spectra. During FY 91, the final year of the grant, the final Slightly-Enriched Spectral Shift Reactor (SESSR) design was determined, and reference design analyses were performed for the assemblies as well as the global core configuration, both at the beginning of cycle (BOC) and with depletion. The final SESSR design results in approximately a 20% increase in the utilization of uranium resources, based on equilibrium fuel cycle analyses. Acceptable pin power peaking is obtained with the final core design, with assembly peaking factors equal to less than 1.04 for spectral shift control rods both inserted and withdrawn, and global peaking factors at BOC predicted to be 1.4. In addition, a negative Moderation Temperature Coefficient (MTC) is maintained for BOC, which is difficult to achieve with conventional advanced converter designs based on a closed fuel cycle. The SESSR design avoids the need for burnable poison absorber, although they could be added if desired to increase the cycle length while maintaining a negative MTC.

This report presents the results of the first phase of the ongoing EG&G Idaho, Inc. Software Reliability Research Program. The program is studying the existing software reliability models and proposes a state-of-the-art software reliability model that is relevant to the nuclear reactor control environment. This report consists of three parts: (1) summaries of the literature review of existing software reliability and fault tolerant software reliability models and their related issues, (2) proposed technique for software reliability enhancement, and (3) general discussion and future research. The development of this proposed state-of-the-art software reliability model will be performed in the second place. 407 refs., 4 figs., 2 tabs.

6656 (GA-A-20717) **MHTGR steam generator on-line heat balance, instrumentation and function.** Klapka, R.E. (General Atomics, San Diego, CA (United States)); Howard, W.W.; Etzel, K.T.; Basol, M.; Karim, N.U. General Atomics, San Diego, CA (United States). Sep 1991. 2p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC03-89SF17885. (CONF-911104–2: Nuclear energy forum: a new strategy to build on, San Francisco, CA (United States), 10-14 Nov 1991). Order Number DE92002311. Source: OSTI; NTIS; INIS; GPO Dep.

Instrumentation is used to measure the Modular High Temperature Gas-Cooled Reactor (MHTGR) steam generator dissimilar metal weld temperature during start-up testing. Additional instrumentation is used to determine an on-line heat balance which is maintained during the 40 year module life. In the process of calibrating the on-line heat balance, the helium flow is adjusted to yield the optimum boiling level in the steam generator relative to the dissimilar metal weld. After calibration is complete the weld temperature measurement is non longer required. The reduced boiling level range results in less restrictive steam generator design constraints.

6657 (KAERI/RR–948/90) **A study on the human factors of nuclear power plants man-machine interface.** Shin, Hyun Kook (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Lee, Jeong Woon; Lee, Yong Hee; Oh, In Suk; Park, Geun Ok. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 240p. (In Korean). Order Number DE92615094. Source: OSTI; NTIS (US Sales Only); INIS.

Approaches of the MMIS design were analysed in this project. Both systems approach and experimental approach were studied. In addition, guidelines for the design of MMI are discussed. The methodology of experimental approach studied in this project can be useful for establishing experimental criteria on MMI design items. The framework of a computer code was developed by utilizing function-based task analysis and procedure information requirements. This can be further developed as a tool useful for the verification and validation of MMI designs. A test facility was designed in compliance with the purpose of experimental approach by considering specific conditions and factors inherent in nuclear power plants. Test facility can be used for conducting experiments which provide detailed human performance and characteristics data at the low level of systems approach. An experimental study was performed to obtain a range of illumination levels suitable for the operation in VDU-based control rooms. Existing design guidelines were tested by this experimental study. A conceptual design of MMIS was developed in accordance with the established MMIS design approach and was evaluated through the comparison to other advanced control room designs. (Author).

6658 (KAERI/RR–984/90) **Optimization of dynamic terms in core overtemperature delta-T trip function.** Park, Jin Ho (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Yoo, Hyung Keun; Um, Kil Sup; Kim, Hee Cheol; Lee, Jong Chul. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Mar 1991. 72p. Order Number DE92615095. Source: OSTI; NTIS (US Sales Only); INIS.

The characteristics of the core overtemperature Delta-T (OT Delta-T) dynamic terms are investigated for various time constants. In addition, the effects of the dynamic terms on the OT Delta-T trip setpoint in case of the uncontrolled RCCA bank withdrawal at power transient are studied by using the NLOOP and the PUMA code. Based on the above study, the procedure in determining the optimal dynamic term is suggested and the time constants of the OT Delta-T dynamic terms are optimized for the KORI 3 and 4 transition core. It reveals that the most improtant one in the OT Delta-T dynamic terms affecting the minimum DNBR thorugh the system transient is the vessel average temperature lead-lag term, and the optimized time constants are 21 seconds for lead and 4 seconds for lag. By this optimization, the core operation region is expected to be improved without changing the core safety limits. (Author).

6659 (PNL-SA–19551) **Towards the development of multilevel-multiagent diagnostic aids.** Stratton, R.C.; Jarrell, D.B. Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 25p. Sponsored by U.S. DOE Nuclear Energy; Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. (CONF-9110272–1: 2. international workshop on principles of diagnosis, Milano (Italy), 14-16 Oct 1991). Order Number DE92002701. Source: OSTI; NTIS; INIS; GPO Dep.

Presented here is our methodology for developing automated aids for diagnosing faults in complex systems. We have designed these aids as multilevel-multiagent diagnostic aids based on principles that should be generally applicable to any complex system. In this methodology, "multilevel" refers to information models described at successful levels of abstraction that are tied together in such a way that reasoning is directed to the appropriate level as determined by the problem solving requirements. The concept of "multiagent" refers to the method of information processing within the multilevel model network; each model in the network is an independent information processor, i.e., an intelligent agent. 19 refs., 15 figs., 9 tabs.

6660 (BNWL-CC–505) **Results of research concerning phosphorus-32 in reactor effluent.** Silker, W.B. Battelle-Northwest, Richland, WA (United States). Pacific Northwest Lab. Nov 1965. 14p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92003730. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Several processes for reducing the concentration of radioisotopes in reactor effluent water have been developed and evaluated. Application of the high alum process for the treatment of reactor cooling water has resulted in a reduction in p^{32} concentration by a factor of 2.3 from pre-1961 levels. An additional factor of 2 could be obtained by subtituting nitrate salts for the sulfates currently employed in the process. Addition of sodium silicate to the cooling water demonstrated to provide a factor of three reduction in the effluent concentration of p^{32}. Passage of reactor effluent water through a bed of aluminum turnings removed half of the p^{32} by adsorption on the aluminum corrosion film. The benefits from these treatments are cumulative; thus, by adoption of both sodium silicate addition and substitution of nitrate salts in the water treatment process the p^{32} concentration could be reduced to about 10% of the 1960 levels. Prior to 1961, it was shown that two-thirds of the p^{32} in-reactor effluent water resulted from activation of inert phosphorus, but that currently, 80% results from n,p reaction on S^{32}. Phosphate ions were found to engage in complex reactions with the film on in-reactor surfaces and are retained for extended lengths of time, while sulfate ions are rapidly released from the film surfaces. Roughly two-thirds of the p^{32} was produced on the surface of aluminum fuel elements, and one-third on the aluminum tube wall. Zirconium components did not provide significant sites for the retention and neutron activation of p^{32} parent isotopes. The chemical form of radiophosphorus in reactor effluent water was determined, both during normal operation and during reactor shutdown. 29 refs., 6 tabs.

6661 (BNWL-SA–668) **Fission product aerosol behavior in the PRTR fuel rod failure of September 29, 1965.** Perkins, R.W.; Thomas, C.W.; Silker, W.B. Pacific Northwest Lab., Richland, WA (United States). 22 Nov 1965. 54p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92003510. Source: OSTI; NTIS (US Sales Only); GPO Dep.

On September 29, 1965, at 0150 a purposely defected partially molten fuel rod in the rupture loop test facility of the PRTR reactor failed in an unexpected manner. The rupture which resulted in a loss of about 30% of the UO_2-PuO_2 fuel from the rod was accompanied by the formation of a hole of approximately 1/2 inch diameter in the surrounding process tube. The subsequent flashing of the highly contaminated superheated water, released a fission product aerosol to the containment vessel atmosphere. This release resulted in about half of the noble gases reaching the containment vessel atmosphere. About 1 percent of the radioiodine and a somewhat smaller fraction of the solid fission products entered the containment vessel atmosphere. A subsequent radiochemical study provided detailed information on the behavior of some 15 fission products and of plutonium in their movement, following the rod failure, through the various liquid and gaseous systems of the reactor and its containment vessel. The ratios of the fission products (other than the noble gases) which were release to the containment vessel atmosphere were not far different from those in the fuel rod showing that relatively little fractionation occurred in the processes of dis- solution and aerosol formation. The observed deposition per unit area on metal surfaces was much higher than on painted surfaces. Much of the behavior of the radionuclides in this system was similar to what might be expected in the melt-down of any water cooled reactor and the information gained from the study should be applicable to the design of safeguards for such events.

6662 (DOE-HMIP-RR-91.035) **Discharges from nuclear power stations.** Department of the Environment, London (United Kingdom). Her Majesty's Inspectorate of Pollution; Atkins (W.S.) Engineering Sciences Ltd., Warrington (United Kingdom). Feb 1991. 255p. Contract PECD-7/9/465. Order Number DE92614966. Source: OSTI; NTIS (US Sales Only); INIS.

HM Inspectorate of Pollution commissioned, with authorising responsibilities in England and Wales, a study into the discharges of radioactive effluents from Nuclear Power Stations. The study considered arisings from nuclear power stations in Europe and the USA and the technologies to treat and control the radioactive discharges. This report contains details of the technologies used at many nuclear power stations to treat and control radioactive discharges and gives, where information was available, details of discharges and authorised discharge limits. (author).

During routine operation of pressurized water reactors, the piping walls become radioactively contaminated. The contamination results from the buildup of radionuclides in the piping films and the deposition of particulate solids (crud) that have become activated by recirculating through a nuclear flux. Several serious problems, both mechanical and economical, arise from the buildup of crud and background radioactivity in a reactor system. To minimize such buildup it is necessary to understand the mechanisms by which they occur and the relative importance of operating variables (i.e., coolant quality, temperature, flux, velocity and etc.). The purpose of this report is to review the problem areas involved, to summarize the progress to date, and present a program to accomplish the remainder of the goals. 8 refs.

6665 (HW-SA–3547) **Preliminary rough draft of contribution to book manuscript: Chapter 6, Contamination and film formation.** Richman, R.B. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 25 May 1964. 9p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92002841. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document is a preliminary rough draft and it provides a discussion of corrosion, film buildup, and contamination in reactor cooling systems. The important radionuclides and their means of production in single-pass cooled reactors are discussed. The characteristics of films formed are also discussed. (FI)

6666 (NUREG/CR–5345) **Fission product release and fuel behavior of irradiated light water reactor fuel under severe accident conditions: The ACRR ST-1 Experiment.** Allen, M.D. (Sandia National Labs., Albuquerque, NM (United States)); Stockman, H.W.; Reil, K.O.; Fisk, J.W. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Sandia National Labs., Albuquerque, NM (United States). Nov 1991. 298p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (SAND–89-0308). Source: OSTI; NTIS; INIS; GPO.

The annular Core Research Reactor (ACRR) Source Term (ST) Experiment program was designed to obtain time-resolved data on the release of fission products from irradiated fuels under well-controlled light water reactor severe accident conditions. The ST-1 Experiment was the first of two experiments designed to investigate fission product release. ST-1 was conducted in a highly reducing environment at a system pressure of approximately 0.19 MPa, and at maximum fuel temperatures of about 2490 K. The data will be used for the development and validation of mechanistic fission product release computer codes such as VICTORIA.

6667 (NUREG/CR–5808) **Calculation of absorbed doses to water pools in severe accident sequences.** Weber, C.F. (Oak Ridge National Lab., TN (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Oak Ridge National Lab., TN (United States). Dec 1991. 40p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. (ORNL/TM–11970). Source: OSTI; NTIS; INIS; GPO.

A methodology is presented for calculating the radiation dose to a water pool from the decay of uniformly distributed nuclides in that pool. Motivated by the need to accurately model radiolysis reactions of iodine, direct application is made to fission product sources dissolved or suspended in containment sumps or pools during a severe nuclear reactor accident. Two methods of calculating gamma absorption are discussed - one based on point-kernal integration and the other based on Monte Carlo techniques. Using least-squares minimization, the computed results are used to obtain a correlation that relates absorbed dose to source energy and surface-to-volume ratio of the pool. This correlation is applied to most relevant fission product nuclides and used to actually calculate transient sump dose rate in a pressurized-water reactor (PWR) severe accident sequence.

Sponsored by U.S. DOE Assistant Secretary for International Affairs and Energy Emergencies. DOE Contract W-31109-ENG-38. (CONF-9111149–2: 14. international meeting on reduced enrichment for research and test reactors, Jakarta (Indonesia), 4-7 Nov 1991). Order Number DE92004138. Source: OSTI; NTIS; INIS; GPO Dep.

The 14-MW TRIGA steady state reactor (SSR) located in Pitesti, Romania, first went critical in the fall of 1979. Initially, the core configuration for full power operation used 29 fuel clusters each containing a 5 × 5 square array of HEU (10 wt%) – ZrH – Er (2.8 wt%) fuel-moderator rods (1.295 cm o.d.) clad in Incology. With a total inventory of 35 HEU fuel clusters, burnup considerations required a gradual expansion of the core from 29 to 32 and finally to 35 clusters before the reactor was shut down because of insufficient excess reactivity. At this time each of the original 29 fuel clusters had an overage ^{235}U burnup in the range from 50 to 62%. Because of the US policy regarding the export of highly enriched uranium, fresh HEU TRIGA replacement fuel is not available. After a number of safety-related measurements, the SSR is expected to resume full power operation in the near future using a mixed core containing five LEU TRIGA clusters of the same geometry as the original fuel but with fuel-moderator rods containing 45 wt% U

(19.7% ^{235}U enrichment) and 1.1 wt% Er. Rods for 14 additional LEU fuel clusters will be fabricated by General Atomics. In support of the SSR mixed core operation numerous neutronic calculations have been performed. This paper presents some of the results of those calculations.

6669 (ANL/CP-74818) **Status report on conversion of the Georgia Tech Research Reactor to low enrichment fuel.** Karam, R.A. (Georgia Inst. of Tech., Atlanta, GA (United States)); Matos, J.E.; Mo, S.C.; Woodruff, W.L. Argonne National Lab., IL (United States). [1991]. 10p. Sponsored by U.S. DOE Assistant Secretary for International Affairs and Energy Emergencies. DOE Contract W-31109-ENG-38. (CONF-9111149-3: 14. international meeting on reduced enrichment for research and test reactors, Jakarta (Indonesia), 4-7 Nov 1991). Order Number DE92004137. Source: OSTI; NTIS; INIS; GPO Dep.

The 5 MW Georgia Tech Research Reactor (GTRR) is a heterogeneous, heavy water moderated and cooled reactor, fueled with highly-enriched uranium aluminum alloy fuel plates. The GTRR is required to convert to low enrichment (LEU) fuel in accordance with USNRC policy. The US Department of Energy is funding a program to compare reactor performance with high and low enrichment fuels. The goals of the program are: (1) to amend the SAR and the Technical Specifications of the GTRR so that LEU U_3Si_2-Al dispersion fuel plates can replace the current HEU U-Al alloy fuel, and (2) to optimize the LEU core such that maximum value neutron beams can be extracted for possible neutron capture therapy application. This paper presents a status report on the LEU conversion effort.

6670 (ANL/CP-74819) **The RERTR Program: A status report.** Travelli, A. Argonne National Lab., IL (United States). [1991]. 12p. Sponsored by U.S. DOE Assistant Secretary for International Affairs and Energy Emergencies. DOE Contract W-31109-ENG-38. (CONF-9111149-4: 14. international meeting on reduced enrichment for research and test reactors, Jakarta (Indonesia), 4-7 Nov 1991). Order Number DE92004136. Source: OSTI; NTIS; INIS; GPO Dep.

The progress of the Reduced Enrichment Research and Test Reactor (RERTR) Program is described. The major events, findings, and activities of 1991 are reviewed after a brief summary of the results which the RERTR Program had achieved by the end of 1990 in collaboration with its many international partners.

6671 (BNWL-CC-455) **N-reactor stack integrity.** Morgan, W.C. Pacific Northwest Lab., Richland, WA (United States). Jan 1966. 30p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92002848. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The N-Reactor moderator consists of a horizontal stack of graphite bars interlocked by "Lincoln-Log" type keys. In addition to the fueled process channels, secondary coolant channels are arranged in vertical planes, passing side-to-side through the filler layers. The vertical planes of cooling tubes produce a periodic sinusoidal variation in temperature along the length of the tube blocks. The purpose of this preliminary report is to survey phenomena which could affect N-Reactor stack integrity and to estimate the dimensional changes and possible magnitude of the effects for two operating cases. Uncertainties in the data preclude precise predictions of the timing of the events at present; however, the relative magnitudes and timing of events for the two cases should be quite accurate. The precision of the predictions are of little consequence at the present time since significant changes in operating conditions are contemplated and are expected to go into effect within the next year. Several experimental programs are in progress to improve some of the estimates used in this analysis, this report can be up-dated as necessary when data become available from these programs and when interest is shown in other operating conditions. 24 refs., 12 figs., 5 tabs.

6672 (BNWL-CC-1055) **Water treatment variables – nitrate system.** Silker, W.B. Battelle Pacific Northwest Lab., Richland, WA (United States). Feb 1967. 17p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92003731. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The radioisotopes present in Hanford reactor effluent water originate from two primary sources; activated impurities that enter the reactor through the cooling water supply, and corrosion products from in-reactor components. The coolant impurities are derived primarily from the raw Columbia River water, however, sulfates are added in the water treatment process and sodium dichromate is introduced as a corrosion inhibitor. The inert river water impurities are present in a variety of chemical and physical forms, ranging from ionic to particulate; both colloidal and larger in size. Chemical treatment of the raw water removes these materials with varying degrees of success depending on the conditions of treatment and the form in which the impurity exists. It is not within the scope of this presentation to detail the many complex parameters involved in the water treatment process, however, a brief summary of those aspects that are germane to this study are presented. The basis for treatment of the cooling water is to remove colloids, suspensoids and ionic constituents from the raw water prior to its introduction into the reactor. This study summarizes variables within the water treatment process.

6673 (CONF-920308-7) **Calculation of critical experiment parameters for the High Flux Isotope Reactor.** Primm, R.T. III. Oak Ridge National Lab., TN (United States). [1991]. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Advances in reactor physics; Charleston, SC (United States); 8-11 Mar 1992. Order Number DE92004232. Source: OSTI; NTIS; INIS; GPO Dep.

Six critical experiments were performed shortly before the initial ascension to power of the High Flux Isotope Reactor (HFIR). Critical configurations were determined at various control rod positions by varying the soluble boron content in the light water coolant. Calculated k-effective was 2% high at beginning-of-life (BOL) typical conditions, but was 1.0 at end-of-life (EOL) typical conditions. Axially averaged power distributions for a given radial location were frequently within experimental error. At specific r,z locations with the core, the calculated power densities were significantly different from the experimentally derived values. A reassessment of the foil activation data seems desirable.

6674 (DOE/DP-0094P) **Operational Readiness Review: K-Reactor restart, Savannah River Site.** Department of Energy, Washington, DC (United States). Assistant Secretary for Defense Programs. Nov 1991. 123p. Sponsored by U.S. DOE Defense Programs. Order Number DE92004779. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The K-Reactor Operational Readiness Review (ORR) is one of several activities to be completed prior to restart of the K-Reactor. The Secretary of Energy will rely in part on the results of this ORR in deciding whether the restart criteria set for the reactor have been met. The K-Reactor has been shutdown for over 3 years. Since shutdown, the Department of Energy (DOE) has required that improvements be made in the design of reactor features, that plant safety analyses be revised, and that upgrades by made in various operational and administrative areas prior to reactor startup. The conduct of this ORR was required as an independent check on the adequacy of the improvements. The review was conducted in three phases from May 13, 1991, through October 18, 1991. The ORR was conducted in four major areas, namely, operations, maintenance and surveillance, engineering and technical support, and organization and management. In addition, the ORR team assessed by sampling the adequacy of selected chapters of the Safety Evaluation Report, the adequacy of the closure process for issues in the Reactor Operations Management Plan, and compliance with DOE Orders. The ORR team review has concluded that K-Reactor can be restarted and safely operated after verified correction of the findings that are described in the report. Also, continued operation of the reactor requires timely correction and verification of the observations listed in the report.

6675 (ECN-C-91-006) **Benchmark calculations for MTR-type reactors: HEU benchmark.** Liu Guisheng (China Nuclear Information Centre, Beijing, BJ (China)); Slobben, J.; Oppe, J. Netherlands Energy Research Foundation, Petten (Netherlands). Feb 1991. 50p. Contract no. JRCP: B004422;Contract no. ECN: 0368. Order Number DE92613836. Source: OSTI; NTIS (US Sales Only); INIS.

In the framework of validation of the new ECN system of computer codes and data libraries for the calculation of neutron physics in nuclear reactor systems, a series of benchmark calculations is being performed. One of these benchmarks is the Highly Enriched Uranium bench-mark for an MTR-type of reactor; this report describes the calculational method for and the results from this benchmark study. Comparison of these results with those calculated by other organizations show a satisfactory agreement. (author). 6 refs.; 13 figs.; 20 tabs.

6676 (ECN-C–91-040) **Neutron metrology in the HFR: PSF vessel surveillance experiment SURP-02 (RX189-02) : (monitor sets series FDSURP21).** Hoving, A.H.; Voorbraak, W.P. Netherlands Energy Research Foundation, Petten (Netherlands). Mar 1991. 47p. Project nr. 0699.01;GCOP order nr. 10635. Order Number DE92613837. Source: OSTI; NTIS (US Sales Only); INIS.

In this report the results are presented for the thermal and fast neutron measurements with the first series of activation monitors loaded in surveillance experiment RX189-02 (SURP-02). (author). 17 refs.; 6 figs.; 11 tabs.

6677 (HAN–29905) **[Power levels of Hanford piles].** Peterson, A.V. (USAEC, Washington, DC (United States)). USAEC, Washington, DC (United States); Hanford Works, Richland, WA (United States). 9 Jan 1950. 2p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92006560. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Short communication. HANFORD PRODUCTION REACTORS/reactor operation; POWER DISTRIBUTION; TEMPERATURE EFFECTS

6678 (HW–7-3689) **P Department: 100-B Area shutdown progress report, period ending March 24, 1946.** Gross, C.N. Hanford Works, Richland, WA (United States). 26 Mar 1946. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004546. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes shutdown issues for the 100-B Area during the period ending March 24, 1946. (JL)

6679 (HW–7-3789) **P Department: 100-B Area shutdown progress report, interim March 25–April 3, 1946.** Gross, C.N. Hanford Works, Richland, WA (United States). 4 Apr 1946. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92004547. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses aspects of the 100-B Area shutdown for March 25th through April 3rd, 1946. Separation of high and normal concentration slugs is also included in the summary. (JL)

6680 (HW–30852) **Annual report for 1953 on radiation surveys of Reactor Section buildings outside exclusion areas.** Jerman, P.C. Hanford Works, Richland, WA (United States). 12 Feb 1954. 2p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92003044. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Periodic surveys were made of all Reactor Section buildings outside of the Exclusion Areas and Radiation Zones to detect the presence of contamination. These surveys are an indication of the efficiency of the contamination control measures practiced in the respective plant areas. In general and only very low level contamination was found.

6681 (HW–51970) **K reactor's hydraulic demand.** Hess, K.W. Hanford Works, Richland, WA (United States). 16 Aug 1957. 5p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92002874. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Operation of the Hanford production reactors has pioneered the technology of the light-water-cooled, graphite-moderated nuclear reactor. Fourteen years of operation have provided ample opportunity to determine the advantages–and the disadvantages–of this design. This article presents a brief description of the three original Hanford 100 B, D, and F production reactors and the associated water plants plus core operational problems which may be declassified at this time. 7 figs., 1 tab.

Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92002886. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A solid, natural uranium, eight inch, HAPO fuel element failed in tube 4074 KE on 1-3-58 after an exposure of 465 MWD/T. The rupture, HAPO failure #976, which was part of production test IP-80-A, was classified as a "side hot spot" failure. After discharge, the slug was transferred to the Radiometallurgy Laboratory to determine the cause of failure and the effect of abnormally high operating temperatures on the M-388 jacket. This document provides a discussion of this failure.

6686 (HW–66468) **Reactor process channel water leak history, FY 1959 and 1960.** Young, J.R. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 17 Aug 1960. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92002888. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A general reduction in the frequency of leaks has occurred during the last two years – the total dropping from 163 in FY 1959 to 120 in FY 1960. This can be attributed to continued emphasis on eliminating leaks due to all causes. However, it should be noted that the frequency of three types of leaks, the thin top, the rupture, and the transverse crack, has increased. Future emphasis must be placed particularly on eliminating these leaks, in addition to continuing efforts to reduce the other types. This document discusses leak classification and causes. 3 tabs.

6687 (HW–68718-Del.) **Irradiation Processing Department monthly report for February 1961.** Hanford Works, Richland, WA (United States). 15 Mar 1961. 81p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. (HAN–78124-Del.). Order Number DE92001667. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document details activities of the Irradiation Processing Department during the month of February 1961. (FI)

Aerosol problems of nuclear reactors: chemical engineering aspects, Harwell (United Kingdom), 7-8 Dec 1960). Order Number DE92003509. Source: OSTI; NTIS (US Sales Only); GPO Dep.

When the construction of the confinement facilities for Hanford production reactors is completed, the potential for contaminating the environment with accidentally released fission products will be greatly reduced. This was demonstrated already when rupture debris burned in the rear face area of one of the reactors in which the fog spray was installed and ready for service. The fog spray effectively prevented the spread of contamination to the ventilation equipment downstream of the rear face enclosure. Also, the commercially- available absolute filters and charcoal beds will significantly decontaminate the exhaust air, stream of all fission products except the noble gases. Laboratory studies indicate that the filter system should remove at least 50 percent of all fission product halogen vapors and over 90 percent of the particulate matter released from a nuclear incident. In addition, the charcoal beds should provide an additional 90 to 95 percent decontamination of the halogens that manage to pass through the filter. It is not expected that any of the noble gases released will be removed by this system. Laboratory studies, in general, substantiate previous estimates on the release of fission products from overheated uranium fuels. The theoretical estimates are quite accurate for the volatile and semi-volatile elements but were high for the nonvolatiles. For all conditions tested in the laboratory, the measured release of strontium, barium, and zirconium was less than 0.5 percent. It was also found that most released fission products tended to deposit on any surface they contacted, a property which would cause a large fraction of fission products to be retained by the reactor and associated hardware. 11 refs., 8 figs., 6 tabs.

6689 (INFO–0335) **The effect of high-frequency ground motion on the MAPLE-X10 reactor.** Bhan, S. (Acres Consulting Services Ltd., Toronto, ON (Canada)); Dunbar, S. Atomic Energy Control Board, Ottawa, ON (Canada). Jun 1989. 62p. Order Number DE92613838. Source: OSTI; NTIS (US Sales Only); INIS.

The effect of high-frequency ground motion on structures and equipment in nuclear reactors is examined by subjecting simple linear models to selected recorded ground motions which exhibit low and high frequencies. Computed damage measures indicate that high-frequency short-duration ground motion, such as that observed in eastern North America, have a minimal effect on structures with low natural frequencies. Response spectra of high-frequency ground motion indicate that higher forces are induced in structures with high natural frequencies as compared to those induced by low-frequency ground motion. However, reported observations of earthquake damage in eastern North America suggest that high-frequency ground motion causes little of no damage to structures. This may be due to the energy absorption capability of structures. It is concluded that the response spectrum representative of ground motion observed in eastern North America may give an over-conservative measure of the response of structures with high natural frequencies, since it does not account for the typically observed short duration of high-frequency ground motion and for the energy absorption capability of structures. Detailed nonlinear analysis of specific structures with high natural frequencies should be performed to better predict the actual response. Recommendations for a nonlinear analysis of typical structures with high natural frequencies are made.

6690 (JAERI-M–91-130) **Annual progress report on the NSRR experiments, (19): January 1987 through December 1987.** Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1991. 164p. (In Japanese). Order Number DE92750960. Source: OSTI; NTIS (US Sales Only); INIS.

Fuel behavior studies in simulated reactivity initiated accident (RIA) conditions have been performed by utilizing Nuclear Safety Research Reactor (NSRR) since October 1975. This report describes the results obtained from experiments performed from January through December, 1987. A total of 38 tests was carried out during this period : those are 5 NSRR standard fuel test, 6 fuel design parameter tests (2 fuel tests with iodine, 3 tests with SUS claddings, and 1 for destructive force measurement test), 7 cooling parameter tests (3 test with flow tube and 4 bundle tests), 8 advanced type fuel tests (1 NRC tests, 5 PCI-resistant fuel tests, 2 pressurized hollow fuel tests), 1 high pressure /high temperature tests, 2 high temperature /high pressure loop tests, 3 high temperature flooding tests, 3 fuel motion observation tests, and 3 miscellaneous atmospheric pressure capsule tests (1 fuel damage test, 2 acceleration tests). The progress of computer code development is also described. (author).

6691 (JAERI-M–91-139) **Installation of JRR-2 neutron medical irradiation facility.** Arigane, Kenji (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Yamada, Tadanori; Nemoto, Denjiro; Banba, Masao; Kawarai, Kunio. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1991. 68p. (In Japanese). Order Number DE92751016. Source: OSTI; NTIS (US Sales Only); INIS.

For Boron Neutron Capture Therapy (BNCT) on brain tumor, a medical irradiation facility has been installed in the Japan Research Reactor No.2 (JRR-2) in Japan Atomic Energy Research Institute (JAERI). This facility consists of a neutron beam tube, an irradiation room and operating room. The cross section of the neutron beam tube is 200 mm x 200 mm and the thermal neutron flux at the irradiation position is 1×10^9 n/cm^2/s with a gamma ray contamination of 1.7% at reactor thermal power of 10 MW. Single crystal bismuth filter and a polyethylene collimator were applied to optimize the neutron beam condition, and LiF tiles and Styrene-Butadiene-Rubbers (SBR) admixed with B_4C were used for suppressing the secondary gamma-rays from the construction materials of the facility. The first BNCT treatment by this facility was successfully performed on August 10th in 1990. Developments of the medical irradiation on the brain tumor and melanoma will be done by using this facility. (author).

6692 (KAERI/RR–961/90) **Fluid flow test for KMRR fuel assemblies.** Chung, Moon Ki (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Yang, Sun Kyu; Chung, Chang Hwan; Chun, See Young; Song, Chul Hha; Jun, Hyung Gil; Chung, Heung Joon; Won, Soon Yeun; Cho, Young Rho; Kim, Bok Deuk. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 134p. (In Korean). Order Number DE92615115. Source: OSTI; NTIS (US Sales Only); INIS.

Hydraulic and velocity measurment tests were carried out for the KMRR fuel assembly. Two types of the KMRR fuel assembly are consist of longitudinally finned rods. Experimental data of the pressure drops and friction factors for the KMRR fuel assemlby were produced. The measurement technique for the turbulent flow structure in subchannels using the LDV was obtained. The measurement of the experimental constant of the thermal hydraulic analysis code was investigated. The results in this study are used as the basic data for the development of an analysis code. The measurement technique acquired in this study can be applied to the KMRR thermal hydraulic commissioning test and development of the domestic KMRR fuel fabrication. (Author).

6693 (KAERI/RR–964/90) **A study on KMRR utilization for fuel development.** Kang, Young Hwan (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Ryu, Woo Seog; Park, Ji Yeon; Joo, Kee Nam; Park, Jong Man; Park, Se Jin. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 164p. (In Korean). Order Number DE92615116. Source: OSTI; NTIS (US Sales Only); INIS.

The most effective utilization scheme of the KMRR was studied in the field of nuclear fuel development through reviewing literatural documents on irradiation facilities and in-pile test. It is suggested that the KMRR should be used for verification tests of advanced fuels and for power ramping /cycling tests of fuel rods. In addition, the characterization tests for fuel development and the basic material research should be also performed. In-pile loops for fuel verification and/or power ramping /cycling tests are proposed to be installed in advance, and capsules are necessary for power ramping /cycling tests, fuel characterization tests and /or material tests. Instrumentation technologies for thermocouple, SPND (Self-Powered Neutron Detector) and pressure transducer, and the in-situ dimensional measuring systems have to be developed to obtain the useful and various results from irradiation tests in the KMRR. A mock-up test rod for characterizing fuel thermal response was manufactured and the related technologies as well as the design specification were set up. An equipment for microdrilling and grooving of fuel pellets and an apparatus for diffusion-bonding between zircaloy-4 and stainless steel were made. A study to verify the integrity of test rod weldments is presented using out-of pile corrosion test. (Author).

6694 (KAERI/RR–983/90) **Triga mark-II,III reactor safety re-evaluation.** Jun, Byung Jin (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Park, Sang Jun; Kim, Young Joo. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Mar 1991. 205p. (In Korean). Order Number DE92615117. Source: OSTI; NTIS (US Sales Only); INIS.

In order to revise safety analysis report of old TRIGA reactors, safety re-evaluation of these reactor was started for necessary parts. This report contains the first year results of the project scheduled for two years. The guide lines of safety re-evaluation was made by translating that of nuclear power plant from the view point of TRIGA reactor confirming the basic safety philosophy as much as possible. First of all, sections of reactor history and comparison with similar reactors are made, since the actual operation records, changes, any modification of similar reactors constructed after then, etc., are realistic and valuable data from the safety aspect of old reactor. For the effectiveness of nuclear analysis, a PC based analysis system using WIMS-D/4 and VENTURE was established, and a program for the natural convection cooling analysis of TRIGA reactor was developed. As a result of thermal-hydraulic analysis it was confirmed that the operation limit of fuel temperature set at 650 deg C without any logical reason is very close to the DNB limit. (Author).

6695 (KEK–90-25(v.1), pp. 75-86) **Status of the advanced neutron source.** Hayter, J.B. (Oak Ridge National Lab., TN (United States)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Research reactors in the United States are becoming more and more outdated, at a time when neutron scattering is being recognized as an increasingly important technique in areas vital to the U.S. scientific and technological future. The last U.S. research reactor was constructed over 25 years ago, whereas new facilities have been built or are under construction in Japan, Russia and, especially, Western Europe, which now has a commanding lead in this important field. Concern over this situation in the early 1980's by a number of organizations, including the National Academy of Sciences, led to a recommendation that design work start urgently on an advanced U.S. neutron research facility. This recommendation is realized in the Advanced Neutron Source Project. The centerpiece of the Advanced Neutron Source will be a new research reactor of unprecedented flux ($> 7.5x10^{19}\ m^{-2}{\cdot}s^{-1}$), equipped with a wide variety of state-of-the-art spectrometers and diffractometers on hot, thermal, and cold neutron beams. Very cold and ultracold neutron beams will also be provided for specialized experiments. This paper will discuss the current status of the design and the plans for scattering instrumentation. (author).

6696 (KEK–90-25(v.1), pp. 109-118) **Pulsed neutron sources at Dubna: Their past, present and future status.** Shabalin, E.P. (Joint Inst. for Nuclear Research, Dubna (USSR)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

In 1960 the first world repetitively pulsed reactor IBR was put into operation. It was the beginning of the story how fission based pulsed neutron sources at Dubna have survived. The engineers involved have experienced many successes and failures in the course of new sources upgrading to finally come to possess the world's brightest neutron source - IBR-2. The details are being reviewed through the paper. The fission based pulsed neutron sources did not reach their final state as yet- the conceptual views of IBR prospects are being discussed with the goal to double the thermal neutron peak flux (up to $2x10^{16}$) and to enhance the cold neutron flux by 10 times (with the present one being as high that of the ISIS cold moderator). (author).

6697 (ORNL–6022) **Diversion assumptions for high-powered research reactors: ISPO C-50 Phase 1.** Binford, F.T. Oak Ridge National Lab., TN (United States). Jan 1984. 71p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. (ISPO–201). Order Number DE92002276. Source: OSTI; NTIS; GPO Dep.

This study deals with diversion assumptions for high-powered research reactors – specifically, MTR fuel; pool- or tank-type research reactors with light-water moderator; and water, beryllium, or graphite reflectors, and which have a power level of 25 MW(t) or more. The objective is to provide assistance to the IAEA in documentation of criteria and inspection observables related to undeclared plutonium production in the reactors described above, including: criteria for undeclared plutonium production, necessary design information for implementation of these criteria, verification guidelines including neutron physics and heat transfer, and safeguards measures to facilitate the detection of undeclared plutonium production at large research reactors.

6698 (SAND–91-2310C) **A fission fragment reactor concept for nuclear thermal propulsion.** Suo-Anttila, A.J.; Parma, E.J.; Pickard, P.S.; Wright, S.A.; Vernon, M.E. Sandia National Labs., Albuquerque, NM (United States). 16 Sep 1991. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-920104–20: 9. symposium on space nuclear power systems, Albuquerque, NM (United States), 13-16 Jan 1992). Order Number DE92003298. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Space Exploration Initiative requires the development of nuclear thermal and nuclear electric technologies for space propulsion for future Lunar and Mars missions. Sandia National Laboratories has proposed a new nuclear thermal propulsion concept that uses fission fragments to directly heat the propellant up to 1000 K or higher above the material temperatures. The concept offers significant advantages over traditional solid-core nuclear rocket concepts because of higher propellant exit temperatures, while at the same time providing for more reliable operation due to lower structure temperatures and lower power densities. The reactor can be operated in either a steady-state or pulsed mode. The steady-state mode provides a high thrust and relatively high specific impulse, as compared to other nuclear thermal concepts. The pulsed mode requires an auxiliary radiator for cooling, but has the possibility of achieving very high specific impulses and thrust scaleable to the radiator size. The propellant temperatures are limited only by thermal radiation and transient heat conduction back to the substrate walls. 3 refs., 15 figs.

6699 (UCRL-JC–107357) **Energy production using fission fragment rockets.** Chapline, G.; Matsuda, Y. Lawrence Livermore National Lab., CA (United States). Aug 1991. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-910626–14: 6. international conference on emerging nuclear energy systems, Monterey, CA (United States), 16-21 Jun 1991). Order Number DE92002192. Source: OSTI; NTIS; INIS; GPO Dep.

Fission fragment rockets are nuclear reactors with a core consisting of thin fibers in a vacuum, and which use magnetic fields to extract the fission fragments from the reactor core. As an alternative to ordinary nuclear reactors, fission fragment rockets would have the following advantages: Approximately twice as efficient if one can directly convert the fission fragment energy into electricity; by reducing the buildup of a fission fragment inventory in the reactor one could avoid a Chernobyl type disaster; and collecting the fission fragments outside the reactor could simplify the waste disposal problem. 6 refs., 4 figs., 2 tabs.

6700 (UNI–81-01) **Loss of instrument air to N plant auxiliary buildings: Abnormal occurrence report No. 81-01: Final report.** UNC Nuclear Industries, Inc., Richland, WA (United States). 11 Jun 1982. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. Order Number DE92001684. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document provides a discussion of the occurrence of a loss of instrument air to the N-Reactor auxiliary buildings. Causes, consequences, procedures, and recommendations are presented. (FI)

6701 (WHC-SP–0229) **N Reactor core component surveillance report for 1987.** Westinghouse Hanford Co., Richland, WA (United States). Mar 1988. 239p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE92002812. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the results of inspections and tests performed during Calendar Year 1987 to monitor the aging of N Reactor core components. The results of each surveillance activity are compared with models of component aging or previous observations, except in parts of the graphite section where neither models nor previous observations were established or performed. In those cases where the measured data indicate unexpected aging effects, planned actions were revised. Revised plans for future surveillance on reactor core components presented in this report have been incorporated into the N Reactor Core Component 5-Year Surveillance Plan. It should be noted that the planned actions in this report do not reflect the decision to place N Reactor in a "cold standby" condition. The surveillance effort focuses on the following critical reactor core components whose performance may be degraded by aging: reactor graphite pressure tubes, the gas system, and graphite cooling tubes. The relationship of these components is illustrated. The reactor core is a cube consisting of interlocking layers of graphite surrounded by an inner metal thermal shield and an outer concrete primary shield. An inert atmosphere is maintained in the core by the gas system. The fuel is contained in Zircaloy-2 horizontal pressure tubes that penetrate the front and rear shields and are part of the reactor cooling system. Perpendicular to the pressure tubes are the horizontal control rods, which enter the reactor through both the left and right shields, and the vertical ball safety system channels, which penetrate the top and bottom shields. 50 refs., 160 figs., 18 tabs.

6702 (WHC-SP–0229-A) **N Reactor core component surveillance report for 1988.** Lamm, L.W.; Woodruff, E.M. Westinghouse Hanford Co., Richland, WA (United States). Feb 1989. 62p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE92002813. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the results of the surveillance activities performed in calendar year 1988 to assess the effects of aging on N Reactor core components. These activities were initially planned to comply with the requirements of the N Reactor Core Component 5-Year Surveillance Plan and the "Planned Action" requirements of the 1987 surveillance Report. However, because of the decision to place N Reactor in "cold standby," the planned surveillance activities were substantially reduced. Only those activities considered absolutely necessary to be accomplished prior to placement of the reactor in "cold standby" were performed in 1988.

6703 (WHC-SP–0600-Rev.1) **Visual inspections of N Reactor horizontal control rod channels: Revision 1.** Woodruff, E.M. Westinghouse Hanford Co., Richland, WA (United States). Sep 1990. 104p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE92002811. Source: OSTI; NTIS; INIS; GPO Dep.

Safety surveillance is performed in horizontal control rod (HCR) channels to locate conditions which could slow or block rod travel. The findings guide the application of preventive measures to assure eventual rod motion impairment will not occur. Borescopes and, more recently, miniaturized closed circuit television (CCTV) cameras have been used for these examinations. Inspections and measurement results are documented in annual surveillance reports, however reported CCTV observations have been limited to highlights. The objective of this report is to catalogue the CCTV recordings in a format suitable for analysis and interpretation and to ease the access to any desired location by noting tape counter readings corresponding with each tube block in view. Searching file tapes for conditions in a specific areas in the past required counting blocks as they passed the camera to determine the distance from a feature like the edge of the reflector or a steam vent gap. This report adds the observations from recent rod channel inspections (1987 and 1988) to a comprehensive survey of graphite conditions in the moderator and reflector regions of the N Reactor core. When completed, the stand-by status of graphite components will be available for use in restart or decommissioning deliberations.

6704 (ANL/CP–74781) **Analyses of corium spreading in Mark I containment geometry.** Sienicki, J.J.; Chu, C.C.; Farmer, M.T. Argonne National Lab., IL (United States). [1991]. 26p. Sponsored by Nuclear Regulatory Commission. DOE Contract W-31109-ENG-38. (CONF-911079–13: 19. Nuclear Regulatory Commission (NRC) water reactor safety information meeting, Bethesda, MD (United States), 28-30 Oct 1991). Order Number DE92004140. Source: OSTI; NTIS; INIS; GPO Dep.

An assessment of melt spreading in the Mark I system has been carried out using the MELTSPREAD-1 computer code together with supporting analyses. Application of MELTSPREAD-1 confirms the calculation of shell survival in a wet containment for the most probable melt release conditions from NUREG/CR-5423. According to MELTSPREAD-1, a dry containment also may not be threatened by melt spreading. This reflects the heat losses undergone by the melt in the process of spreading to the shell conservatively neglected in NUREG/CR-5423. However, there exist parameter ranges outside the most probable set where shell failure may be calculated. Accounting for the breakup and quenching of melt relocating through a deep layer of subcooled water also conservatively neglected in NUREG/CR-5423 can reduce the set of parameter variations for which containment failure is calculated in the wet case.

6705 (BNWL-CC–1367) **Radiological conditions immediately following the September 29, 1965 PRTR incident.** McConnon, D. Pacific Northwest Lab., Richland, WA (United States). Oct 1967. 19p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92003703. Source: OSTI; NTIS (US Sales Only); GPO Dep.

On September 29, 1965, radioactive contamination was released to the containment vessel and several reactor systems of PRTR when approximately 700 grams of fuel material was lost from a ruptured fuel rod. The containment vessel immediately went into ventilation containment and remained in this condition for approximately 19 hours. During this period, one brief personnel entry was made to collect an air sample. A complete radiological survey of operating areas was made about six hours after restoration of ventilation. This report summarizes the radiological conditions observed immediately following the incident until controlled shutdown of the reactor was achieved and the situation was controlled. No attempt is made to discuss the data, only to preserve it for future reference and use. 11 figs., 5 tabs.

6706 (CONF-911079–1) **BWR lower plenum debris bed models for MELCOR.** Hodge, S.A.; Ott, L.J. Oak Ridge National Lab., TN (United States). [1991]. 25p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From 19. Nuclear Regulatory Commission (NRC) water reactor safety information meeting; Bethesda, MD (United States); 28-30 Oct 1991. Order Number DE92001975. Source: OSTI; NTIS; INIS; GPO Dep.

Work is underway at Oak Ridge National Laboratory (ORNL) to incorporate certain models of the Boiling Water Reactor Severe Accident Response (BWRSAR) code into a local version of MELCOR. Specifically, the BWR lower plenum debris bed and bottom head response models taken from BWRSAR are being tested within the local MELCOR code structure. Upon successful completion of testing, recommendations for formal adoption of these models will be made to the Nuclear Regulatory Commission (NRC) and to the MELCOR code development staff at Sandia National Laboratories (SNL). The SNL code development staff retain exclusive responsibility for maintaining the configuration control for the official version of MELCOR. The BWR lower plenum debris bed and bottom head response models permit the calculation of heatup, melting, and relocation of the debris after dryout. They predict the response of the lower plenum internal structures and the bottom head as well as the composition and timing of material release from the vessel. They have been previously applied in severe accident analyses for the Containment Performance Improvement (CPI) Program and the Mark I shell survivability study (NUREG/CR-5423), and in recent assessments of candidate accident management strategies. This paper provides a brief description of the purpose and operation of these models. 11 refs., 15 figs., 5 tabs.

6707 (CONF-911079–6) **Progress in research on aging of structures.** Naus, D.J. (Oak Ridge National Lab., TN (United States)); Oland, C.B.; Ellingwood, B.; Mori, Y.; Arndt, E.G. Oak Ridge National Lab., TN (United States). [1991]. 63p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From 19. Nuclear Regulatory Commission (NRC) water reactor safety information meeting; Bethesda, MD (United States); 28-30 Oct 1991. Order Number DE92002806. Source: OSTI; NTIS; INIS; GPO Dep.

The Structural Aging (SAG) Program is conducted for the Nuclear Regulatory Commission. The program has the overall objective of preparing an expandable handbook or report which will provide the NRC with potential structural safety issues and acceptance criteria for use in nuclear power plant evaluations for continued service. Initial focus of the program is on concrete and concrete-related materials which comprise the safety-related (Category I) structures in light-water reactor facilities. The program consists of a management task and three technical tasks: materials property data base, structural component assessment/repair technology, and quantitative methodology for continued service determinations. Objectives, background information, and accomplishments under each of these tasks are presented.

6708 (CONF-9110210–1) **Accident simulation and consequence analysis in support of MHTGR safety evaluations.** Ball, S.J. (Oak Ridge National Lab., TN (United States)); Wichner, R.P.; Smith, O.L.; Conklin, J.C.; Barthold, W.P. Oak Ridge National Lab., TN (United States). [1991]. 15p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From 1991 water reactor safety meeting; Washington, DC (United States); 28-30 Oct 1991. Order Number DE92002293. Source: OSTI; NTIS; INIS; GPO Dep.

This paper summarizes research performed at Oak Ridge National Laboratory (ORNL) to assist the Nuclear Regulatory Commission (NRC) in preliminary determinations of licensability of the US Department of Energy (DOE) reference design of a standard modular high-temperature gas-cooled reactor (MHTGR). The work described includes independent analyses of core heatup and steam ingress accidents, and the reviews and analyses of fuel performance and fission product transport technology.

6709 (CONF-9111133–2) **Review of recent ORNL specific-plant analyses.** Cheverton, R.D.; Dickson, T.L. Oak Ridge National Lab., TN (United States). [1991]. 20p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From 2. U.S./Japan specialized topic workshop on pressurized thermal shock; San Diego, CA (United States); 14 Nov 1991. Order Number DE92004222. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge National Laboratory (ORNL) has been helping the Nuclear Regulatory Commission (NRC) develop the pressurized thermal shock (PTS) evaluation methodology since the mid-1970s. During the early 1980s, ORNL developed the integrated PTS (IPTS) methodology, which is a probabilistic approach that includes postulation of PTS transients, estimation of their frequencies, thermal/hydraulic analyses to obtain the corresponding thermal and pressure loadings on the reactor pressure vessel, and probabilistic fracture mechanics analyses. The scope of the IPTS program included development of the probabilistic fracture mechanics code OCA-P and application of the IPTS methodology to three nuclear plants in the US (Oconee I, Calvert Cliffs I, and H. B. Robinson II). The results of this effort were used to help establish the PTS Rule (10CFR50.61) and Regulatory Guide 1.154, which pertains to the PTS issue. The IPTS Program was completed in 1985, and since that time the ORNL related effort has been associated with long-term programs aimed at improving/updating the probabilistic fracture mechanics methodology and input data. In 1990, the NRC requested that ORNL review a vessel-integrity evaluation report submitted to the NRC by the Yankee Atomic Electric Co. for the Yankee Rowe reactor and that ORNL also perform an independent probabilistic fracture mechanics analysis. Details of the methodology and preliminary results are the subject of this paper/presentation.

6710 (DOE/DP–0091T) **Safety Evaluation Report Restart of K-Reactor Savannah River Site: Supplement 2.** USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Office of the Deputy Assistant Secretary for Facilities. Oct 1991. 82p. Sponsored by U.S. DOE Defense Programs. Order Number DE92001854. Source: OSTI; NTIS; INIS; GPO Dep.

In April 1991, the Department of Energy (DOE) issued DOE/DP-0084T, "Safety Evaluation Report Restart of K-Reactor Savannah River Site." The Safety Evaluation Report (SER) documents the results of DOE reviews and evaluations of the programmatic aspects of a large number of issues necessary to be satisfactorily addressed before restart. The issues were evaluated for compliance with the restart criteria included in the SER. The results of those evaluations determined that the restart criteria had been satisfied for some of the issues. However, for most of the issues at least part of the applicable restart criteria had not been found to be satisfied at the time the evaluations were prepared. For those issues, open or confirmatory items were identified that required resolution. In August 1991, DOE issued DOE/DP-0090T, "Safety Evaluation Report Restart of K-Reactor Savannah River Site Supplement 1." That document was the first Supplement to the April 1991 SER, and documented the resolution of 62 of the open items identified in the SER. This document is the second Supplement to the April 1991 SER. This second SER Supplement documents the resolution of additional open times identified in the SER, and includes a complete list of all remaining SER open items. The resolution of those remaining open items will be documented in future SER Supplements. Resolution of all open items for an issue indicates that its associated restart criteria have been satisfied, and that DOE concludes that the programmatic aspects of the issue have been satisfactorily addressed.

6711 (DOE/DP–0093T) **Safety evaluation report: Restart of K-Reactor Savannah River Site: Supplement 3.** USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Office of the Deputy Assistant Secretary for Facilities. Dec 1991. 95p. Sponsored by U.S. DOE Defense Programs. Order Number DE92004072. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document is the third and final Supplement to the April 1991 Safety Evaluation Report (SER) of the Savannah River Site. This third SER Supplement documents the resolution of the 121 remaining SER open items. All the restart criteria included in the SER have been satisfied for all issues.

6712 (DOE/NS–0005P) **Report of investigation into allegations of retaliation for raising safety and quality of work issues regarding Argonne National Laboratory's Integral Fast Reactor Project.** USDOE Office of Nuclear Safety, Washington, DC (United States). Dec 1991. 139p. Sponsored by U.S. DOE Nuclear Safety. Order Number DE92004953. Source: OSTI; NTIS; GPO Dep.

This report has been prepared by the Department of Energy's Office of Nuclear Safety concerning allegations made by James A. Smith, a former employee of Argonne National Laboratory-West, located near Idaho Falls, Idaho. Smith, who holds a Ph.D. in metallurgy, was employed as an associate engineer and experimenter at ANL-W from April 1988 until his resignation in August 1990. When he resigned, Smith requested DOE's Chicago Operations Office to investigate his allegations that ANL-W and ANL's Chicago-area laboratory (ANL-E) had sponsored substandard work related to ANL's Integral Fast Reactor project. (Both ANL-E and ANL-W are operated by the University of Chicago under contract to DOE). Smith alleged that the defective work included fundamental errors in metallurgy and related sciences, at least some of which had nuclear safety implications, that ANL had published false and misleading accounts of its work, and that attitudes prevailed at ANL that were antithetical to quality scientific work. Smith also alleged that as a result of expressing these concerns he was subjected to various forms of intimidation and retaliation by ANL-W managers. This report discusses the investigation, the issues, the background of the allegations, and recommendations.

6713 (EGG-M–91216) **Water-hammer in the cold leg during an SBLOCA due to cold ECCS injection.** Ortiz, M.G.; Ghan, L.S. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 4p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC07-76ID01570. (CONF-911213–17: American Society of Mechanical Engineers (ASME) annual winter meeting, Atlanta, GA (United States), 1-6 Dec 1991). Order Number DE92003321. Source: OSTI; NTIS; INIS; GPO Dep.

Water-hammer might occur in the cold leg of pressurized water reactors (PWR) during small break loss-of-coolant accidents (SBLOCA's), when cold emergency core cooling system (ECCS) water is injected into a pipe that may be partially filled with saturated steam. The water may mix with the steam and cause it to condense abruptly. Depending on the flow regime present, slugs of liquid may then be accelerated towards each other or against the piping structure. The possibility of this phenomenon is of concern to us because it may become a dominant phenomenon and change the character of the transient. In performing the code scaling, applicability, and uncertainty study (CSAU) on a SBLOCA scenario, we had to examine the possibility that the transient being analyzed could experience water-hammer and thus depart from the scope of the study. Two criteria for water-hammer initiation were investigated and tested using a RELAP5/MOD3 simulation of the transient. Our results indicated a very low likelihood of occurrence of the phenomenon. 8 refs., 6 figs.

6714 (EGG-M–91370) **Comparison of SCDAP/RELAP5/MOD3 to TRAC-PF1/MOD1 for timing analysis of PWR fuel pin failures.** Jones, K.R. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Katsma, K.R.; Wade, N.L.; Siefken, L.J.; Straka, M. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 15p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC07-76ID01570. (CONF-9111124–3: 1991 RELAP5/TRAC-B international users seminar, Baton Rouge, LA (United States), 4-8 Nov 1991). Order Number DE92003324. Source: OSTI; NTIS; INIS; GPO Dep.

A comparison has been made of SCDAP/RELAP5/MOD3- and TRAC-PF1/MOD1- based calculations of the fuel pin failure timing (time from containment isolation signal to first fuel pin failure) in a loss-of-coolant accident (LOCA). The two codes were used to calculate the thermal-hydraulic boundary conditions for a complete, double-ended, offset-shear break of a cold leg in a Westinghouse 4-loop pressurized water reactor. Both calculations used the FRAPCON-2 code to calculate the steady-state fuel rod behavior and the FRAP-T6 code to calculate the transient fuel rod behavior. The analysis was performed for 16 combinations of fuel burnups and power peaking factors extending up to the Technical Specifications limits. While all calculations were made on a best-estimate basis, the SCDAP/RELAP5/MOD3 code has not yet been fully assessed for large-break LOCA analysis. The results indicate that SCDAP/RELAP5/MOD3 yields conservative fuel pin failure timing results in comparison to those generated using TRAC-PF1/MOD1. 7 refs., 5 figs.

6715 (EGG-M–91489) **PaRaELAP: Realtime multiprocessing RELAP5.** Beelman, R.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 7p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC07-76ID01570. (CONF-9111124–1: 1991 RELAP5/TRAC-B international users seminar, Baton Rouge, LA (United States), 4-8 Nov 1991). Order Number DE92003322. Source: OSTI; NTIS; INIS; GPO Dep.

An effort to parallelize RELAP5 was undertaken in order to capitalize on recent computational hardware developments in achieving the goal of realtime RELAP5 simulation. The objective was attained on a Stardent Titan 750 vector-parallel machine as proof of concept during a small break loss-of-coolant accident simulation on a representative three loop Westinghouse engineering plant model. Technical considerations bearing on the objective of realtime RELAP5 simulation are presented. On-going developmental efforts are discussed. Applications to full-scope, full-fidelity simulation are advanced. 4 refs., 1 fig., 1 tab.

6716 (EGG-M–91501) **Calculation of fuel pin failure timing under LOCA conditions.** Jones, K.R.; Wade, N.L.; Siefken, L.J.; Straka, M.; Katsma, K.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Oct 1991. 24p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC07-76ID01570. (CONF-911079–9: 19. Nuclear Regulatory Commission (NRC) water reactor safety information meeting, Bethesda, MD (United States), 28-30 Oct 1991). Order Number DE92003308. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this research was to develop and demonstrate a methodology for calculation of the time interval between receipt of the containment isolation signals and the first fuel pin failure for loss-of-coolant accidents (LOCAs). Demonstration calculations were performed for a Babcock and Wilcox (B&W) design (Oconee) and a Westinghouse (W) 4-loop design (Seabrook). Sensitivity studies were performed to assess the impacts of fuel pin burnup, axial peaking factor, break size, emergency core cooling system (ECCS) availability, and main coolant pump trip on these items. The analysis was performed using a four-code approach, comprised of FRAPCON-2, SCDAP/RELAP5/MOD3, TRAC-PF1/MOD1, and FRAP-T6. In addition to the calculation of timing results, this analysis provided a comparison of the capabilities of SCDAP/RELAP5/MOD3 with TRAC-PF1/MOD1 for large-break LOCA analysis. This paper discusses the methodology employed and the code development efforts required to implement the methodology. The shortest time intervals calculated between initiation of containment isolation and fuel pin failure were 11.4 s and 19.1 for the B&W and W plants, respectively. The FRAP-T6 fuel pin failure times calculated using thermal-hydraulic data generated by SCDAP/RELAP5/MOD3 were more conservative than those calculated using data generated by TRAC-PF1/MOD1. 18 refs., 7 figs., 4 tabs.

6717 (EUR–13438) **Measuring process of non exceeding the limiting values for radioactive waste to be released from restricted areas.** Auler, I. (Nuklear-Ingenieur Service GmbH, Hanau (DE)); Helk, F.; Neukaeter, E.; Zimmermann, U. Commission of the European Communities, Luxembourg (Luxembourg). 1991. 86p. Contract FI1D-0062. Source: OSTI; NTIS (US Sales Only).

The dismantling of nuclear facilities requires the proof that the radioactivity of materials to be released from restricted areas remains below low limiting values. Parts which are possibly free of radioactivity would have to be disposed of as radioactive waste if a definite proof can not be demonstrated. Decision measurements are hardly possible on parts and material with complex geometry. The specific radioactivity on parts with smooth, plane and open surface is at present estimated manually by analysing representative samples or by measuring the surface of the part with beta sensitive, large-area gas flow detectors. For keeping the cost of measurements at a low level, NIS has developed a measuring device which enables the examination of large amounts of dismantled and potentially releasable components with a fast automatic procedure. The device, with nearly 4-pi detector geometry, measures the gross gamma-radiation which has a higher penetration capacity into the material than beta-radiation. The measuring device has been used since November 1988 in normal operation during the dismantling of the nuclear power plant Niederaichbach. Up to now, 100 Mg (approximately 700 measuring charges) of various dismounted materials were measured with the device for release. The examination of these measurements showed that the specified minimal detectable activity of 1000 Bq Cobalt-60 can be achieved, even with steel shielding of 2 cm thickness.

6718 (GRS-F-BL–2/1991) **List of reports in the field of reactor safety research from BMFT, CEA, EPRI, JSTA and US-NRC. Reported period: April 1 to June 30, 1991.** Gesellschaft fuer Reaktorsicherheit mbH (GRS), Koeln (Germany). Aug 1991. 55p. (In German). Order Number DE92750163. Source: OSTI; NTIS (US Sales Only); INIS.

This list reviews reports from the Federal Republic of Germany, from France, from Japan and from the United States of America concerning single problems in the field of reactor safety research. According to the cooperation of the Bundesminister fuer Forschung und Technologie (BMFT) with the Commissariat a l'Energie Atomique (CEA), the Japan Science and Technology Agency (JSTA), the Electric Power Research Institute (EPRI) and the United States Nuclear Regulatory Commission, these reports are available in the Gesellschaft fuer Reaktorsicherheit (GRS). The list pursues the following order: Country of origin, problem area concerned, according to the Reactor Safety Research Program of the BMFT, reporting organization. The list of reports appears quarterly. (orig./HP).

6719 (HW–32630-Del.) **A bibliography of reactor hazards.** Steach, R.L. (comp.). General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 2 Aug 1954. 63p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92003721. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This annotated bibliography contains 109 references to the classified report literature on the liability of reactors to disaster, the possible consequences of disaster, and reactor accidents which have occurred. The references are arranged alpha-numerically, which is essentially by issuing site. An author index, a subject index, and a report number index are included. The subject index references the reports both by the reactor affected and the potential hazard. The report number index contains both primary and secondary numbers of the reports.

6720 (HW–34847-Pt.14) **KW reactor incident—investigation record: Informational memoranda (Prepared for the committee by Reactor Section personnel).** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 11 Feb 1955. 48p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. Order Number DE92001735. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document provides informational memoranda prepared by reactor section personnel for the investigating committee in regard to the KW Reactor incident investigation. (FI)

6721 (HW–63996) **Coulee disaster report.** Corley, J.P. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 12 Sep 1957. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92002887. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In attempting to assess the hazard to Hanford reactor areas resulting from enemy attack at Ground Coulee, there is one main factor – the size of the breach – plus a host of less important factors. Some of these factors are subject to analysis and calculation, however rough; unfortunately the size of the breach is not. It is thought, however, that additional information as a result of atomic weapon testing in the six years since the original Corps of Engineers report was issued may enable a more reliable and perhaps a more optimistic estimate to be made by a qualified consultant. No other reasonable modifications are foreseen that would affect significantly the previous estimates of damage to be expected in event of a Coulee disaster. Appendix A shows a proposed program of action. Appendix B shows calculated flood levels at HAPO from varying sizes of breaching. 7 refs., 1 fig.

6722 (INIS-BR–2870) **Preoperational radiation measurements at the Angra-I nuclear power plant. Part 1.** Leao, J.L.B.; Barbosa, W.P.; Oberhofer, M. Instituto de Radioprotecao e Dosimetria (IRD), Rio de Janeiro, RJ (Brazil). [1991] 14p. Order Number DE92614964. Source: OSTI; NTIS (US Sales Only); INIS.

During December 10 and 11, 1980, γ-background measurements were performed at the Angra-I nuclear power plant within the reactor containment, within and outside the adjacent building complexes. The dose-rates within the containment averaged around 10,6 μR/h, within the auxiliary building around 14,4 μR/h. The lowest values, 6 μR/h, were measured within the reactor coolant pump and steam generator compartments, the highest value, 25 μR/h, in the charging pump valve operation room, elevation 8,65, close to area monitor No. 4. (author).

6723 (INIS-GB–384) **Nuclear emergencies.** At-A-Glance series. National Radiological Protection Board, Chilton (United Kingdom). 1991 6p. Order Number DE92614965. Source: OSTI; NTIS (US Sales Only); INIS.

Fold-out leaflet.

This leaflet, which is in the form of a fold-up chart, has panels of text which summarize the emergencies that could arise and the countermeasures and emergency plans that have been prepared should nuclear accident occur or affect the United Kingdom. The levels of radiation doses at which various measures would be introduced are outlined. The detection and monitoring programmes that would operate is illustrated. The role of NRPB and the responsible government departments are set out together with an explanation of how the National Arrangements for Incidents involving Radioactivity would be coordinated. (UK).

6724 (JAERI-M–91-103) **A BWR pump suction-line 200% break test at ROSA-III Program (RUN 903): Effect of prolonged recirculation pump operation.** Suzuki, Mitsuhiro (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Nakamura, Hideo; Yonomoto, Taisuke; Kumamaru, Hiroshige; Anoda, Yoshinari; Murata, Hideo. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1991. 177p. Order Number DE92750950. Source: OSTI; NTIS (US Sales Only); INIS.

The Rig-of-Safety Assessment (ROSA)-III Program conducted a 200% recirculation pump-suction line break test, RUN 903, simulating a loss-of-coolant accident (LOCA) in a boiling water reactor (BWR). In this test, the main recirculation pumps (MRPs) were continuously operated during the transient following the break to study the influence of increased core flow rate on the system responses. This report describes major thermal-hydraulic phenomena observed in this test and presents all the experiment data. The effects of prolonged pump operation on system responses are described in comparison with the results of standard 200% break test, RUN 926, in which the core flow coasted down after the break faster than a scaled BWR LOCA condition. It is shown that the significant core heatup observed during the early blow-down phase in RUN 926 was not observed in RUN 903 due to an additional mass transport (approximately 6% of the initial system mass) from the downcomer into the core shroud as a result of the prolonged pump operation. It is clear that the lower-than-scaled transient core flow rate in the ROSA-III tests significantly affected the core thermal conditions especially during the early blowdown phase. (author).

6725 (JAERI-M–91-128) **Fission product release analysis code during accident conditions of HTGR, RACPAC.** Sawa, Kazuhiro (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Tazawa, Yujiro; Itakura, Hirofumi. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1991. 39p. (In Japanese). Order Number DE92750959. Source: OSTI; NTIS (US Sales Only); INIS.

Fission product release analysis code, RACPAC (Fission Product Release Analysis Code from Fuel Particle in Accident Condition), was developed to calculate fractional release from the core during accident conditions of High Temperature Gas-cooled Reactor. RACPAC code has following features. (1) Fission product release fraction after the reactor scram is calculated based on the analytical solution with reduced diffusion coefficient. (2) The reduced diffusion coefficient for each nuclide is calculated from the (R/B) value, which is defined as release rate to birth rate of fission product. (3) The temperature transient after the accident can be taken into consideration in fractional release calculation with RACPAC. This paper describes calculation model of fission product release from fuel particle, calculation model of the reduced diffusion coefficient, users' manual and calculation examples. (author).

6726 (KAERI/RR–954/90) **Development of a computer code concerning the diffusion of radioactive effluents and radiological exposure following an accident.** Lee, Young Bok (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Byung Woo; Han, Moon Hee; Kim, Eun Han; Hwang, Won Tae. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 184p. (In Korean). Order Number DE92615198. Source: OSTI; NTIS (US Sales Only); INIS.

Cheap and clean energy can be supplied with nuclear power plant whose accident probability is very low comparing with that of the other industrial facilities. However, the consequences of severe accident of nuclear power plant may result in a critical impact on population and ecosystem over a wide area due to the radioactive effluents released into the atmosphere as was in the case of the Chernobyl accident. Therefore, it is necessary to prepare an effective computer analysis system for real-time dose assessment against a potential severe accident of nuclear facility. The objective of this study is a development of the real-time assessment system of environmental exposure dose in an emergency and the installation of its prototype system. Wind field model satisfying the mass conservation and Monte Carlo diffusion model to save computing time were developed in order to assess real-time diffusion of radioactive effluents in an accident. Comparing studies were done in

3 kinds of typical topographic situation dependent on every atmospheric stability. Data library of exposure doses was documented by several computer calculation so that computation time could be reduced considerably. These results of the computation with data library showed a good agreement with the real calculation by the existing mode in which numerical integration model was used. And a graphic package was established that enabled to display the wind vector, concentration field of radioactives, and distribution of exposure dose every time step on the color graphic terminal. Work station was composed of host computer CDC-CYBER, graphic application processor - TEK 4301, graphic CRT - TEK 4125 and hard copier - TEK 4693 D. (Author).

6727 (KFK–4827) **Zircaloy oxidation and cladding deformation in PWR-specific CORA experiments.** Minato, K. (Japan Atomic Energy Research Inst. (JAERI), Tokai-Mura (Japan)); Hering, W.; Hagen, S. Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Ingenieurtechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. 105p. Order Number DE92750150. Source: OSTI; NTIS (US Sales Only); INIS.

Out-of-pile bundle experiments (zircaloy 4) are performed in the CORA facility to investigate the behavior of PWR fuel elements during severe fuel damage (SFD) accidents. Within the international cooperation the most significant phenomena such as cladding deformation, oxidation (especially the zirconium/steam reaction), melt formation, melt release, and relocation which were found in all tests have been analyzed. (orig./MM).

6728 (KFK–4850) **Safety oriented LWR research. Annual report 1990.** Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. 270p. (In German). Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

The contributions describe phenomenons of severe fuel damage and aspects of core meltdown accidents. These accidents deal with aerosol behaviour and ventilation systems and the methods for assessing and reducing the radiological concequences of nuclear accidents. Other contributions describe selected questions of safety of HCLWR type reactors. (DG).

6729 (KFK–4850, pp. 59-65) **Measurement of gas components in CORA-experiments.** Huber, R. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik); Schub, I.; Schumacher, G.; Malauschek, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

Quantitative on line analysis of reaction product and sweep gases has been conducted at CORA-7, -13, and -18 experiments by means of quadrupole mass spectrometry. Data obtained allow estimation of the degree of reaction of the steam-water mixture with zircaloy and absorber materials and also the production rate of hydrogen. In CORA-7, which employed a simulation of a PWR-type bundle, the peak production rate of hydrogen was 0.19 g/sec and the total hydrogen production 114 g. The respective values in CORA-18, a BWR-type experiment, were 0.2 g/sec and 106 g total. Improvement of the dilution chamber, that is placed in the line between the gas probe at the bundle exit and one of the two mass spectrometers, allowed a quantitative analysis of hydrogen and water vapour also via this line, which could not be achieved in former experiments. (orig./DG).

6730 (KFK–4850, pp. 66-76) **Aerosol behaviour under core meltdown accident conditions.** Bunz, H. (Kernforschungszentrum Karlsruhe GmbH (Germany). Lab. fuer Aerosolphysik und Filtertechnik 1); Koyro, M.; Propheter, B.; Schoeck, M.; Wagner-Ambs, M. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

The REST-program investigating the fission product release from the sump pool during severe accidents in LWRs was completed. Measurements were performed with $BaSO_4$-suspensions representing the insoluble fractions of the aerosols deposited in the sump water in addition to the already finished experiments with solutions. In contrast to the results with solutions the release rate does not depend on the sump concentration indicating saturation of the suspended material on the surfaces of the rising bubbles. The ratio between the resuspension factors of suspensions and solutions is about 3.5 to 42. (orig./DG).

6731 (KFK–4850, pp. 77-97) **Behaviour of a core melt in the LWR containment.** Alsmeyer, H. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Reaktorbauelemente); Foit, J.J.; Schneider, H.; Stiefel, S.; Tromm, W.; Merkel, G.; Ratajczak, W.; Seibert, J.; Schoenthal, H.; Ziegler, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

Two experiments on melt-concrete interaction have been carried out in the BETA facility to investigate the special influence of high Zirconium content in the metal phase and its consequences on aerosol release. Both experiments show a dominance of Zr oxidation in the first 2 or 3 minutes of the interaction accompanied by high gas release (predominantly hydrogen), high concrete erosion rate, and high void level in the melt. The early chemical energy release mainly from the reaction of the Zirconium with the silicon of the melting concrete is considerably higher than the electrical heating rate to simulate the decay heat in the melt. The aerosol release from the melt is strongly decreasing with time, where the early high aerosol release is coupled with the presence of Zr metal. Selected simulated fission products have been added to the melt in different chemical compositions. (orig./DG).

6732 (KFK–4850, pp. 98-100) **Measurement of gas components in BETA-experiments.** Huber, R. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik); Schub, I.; Schumacher, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

Quantitative on line analysis of reaction product and sweep gases has been conducted at BETA experiments by means of quadrupole mass spectrometry. Data obtained allow estimation of the reaction gases during the interaction of a simulated core melt with concrete. The main gases that develop during this interaction are hydrogen and water vapour. Other gases that appear are carbon monoxide, carbon dioxide and a small amount of methane. During the course of the experiment gas production is high in the first minutes and continues at relatively low levels later in time. Plots of the integrated gas release versus time are given in the report. (orig./DG).

6733 (KFK–4850, pp. 1-30) **Out-of-pile bundle experiments for the investigation of severe fuel damage (CORA program): Tests CORA-7 and CORA-18 (large bundles).** Hagen, S. (Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Ingenieurtechnik); Gruenhagen, A.; Heine, R.; Malauschek, H.; Mueller, G.; Paroth, G.; Seibert, F.; Leopold, L.; Wallenfels, K.P.; Benz, H.; Giessmann, H.; Grehl, C.; Heil, O.; RoetzKernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

Out-of-pile bundle experiments with electrically heated rods are performed in the CORA-facility. Eleven tests with UO_2 pellets were run up to the end of 1990; i.e. eight on PWR and three on BWR fuel element behavior. In the test arrangement for the larger bundles the identical fuel rod simulators as in normal bundles were used. Absorber rods (stainless steel sheathed AgInCd within Zry guide tubes for PWR and B_4C with stainless steel sheath within Zry channel box walls) and spacers (Inconel + Zircaloy) are included, to allow realistic interactions between the fuel element components. The tests were terminated below 2000deg C to better investigate the initial melt movement and the composition of the resulting phases. The temperature escalation continuated even after the shutdown of the steam supply and electric power as long as enough steam was left in the bundle. In principle the escalation behavior turned out to be independent of the bundle size. (orig./DG).

6734 (KFK–4850, pp. 31-51) **Mechanical and chemical behaviour of LWR fuel rod bundles at high temperatures.** Hofmann, P. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Material- und Festkoerperforschung 1 - Teilinstitut Kernbrennstoffe); Markiewicz, M.; Garcia, E.A.; Burbach, J.; Metzger, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

The chemical behaviour of the various PWR absorber rod components has been studied at temperatures up to 1200deg C. The reaction kinetics has been determined for the systems (Ag, In, Cd) absorber/Zircaloy-4 and Zircaloy-4/stainless steel 1.4919 (AISI 316). The interactions can be described by parabolic rate laws; the Arrhenius equations for the various interactions are given. The results of all the single-effects tests and integral CORA experiments performed to date have been used to define three distinct temperature regions in which liquid phases form. The liquid phases contribute essentially to the damage initiation and propagation of the fuel rod bundles. The interpretation of the available results and their impact on possible accident management measures has been described. (orig./DG).

6735 (KFK–4850, pp. 52-58) **Post-test examination and evaluation of the CORA experiments.** Leistikow, S. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Material- und Festkoerperforschung 2 - Teilinstitut Huell- und Strukturmaterialien); Schanz, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

The bundles from the CORA-2 and CORA-3 Severe Fuel Damage (SFD) experiments, consisting of 9 unheated fuel rods and 16 electrically heated simulators, together with an Inconel spacer grid at middle elevation, have been evaluated on the basis of an extensive optical and SEM-analytical investigation of collected samples and selected cross sections. The results take into account measurements and visual observations during the tests as well as informations from single-effects investigations. In the present contribution the CORA-2 and CORA-3 fuel rod bundle degradation is interpreted by a short description of the pertinent phenomena, their causal mechanisms and their mutual interference. (orig./DG).

6736 (KFK–4850, pp. 101-108) **Core meltdown experiments BETA.** Dillmann, H.G. (Kernforschungszentrum Karlsruhe GmbH (Germany). Lab. fuer Aerosolphysik und Filtertechnik 2); Pasler, H.; Schmitt, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

In the BETA facility two experiments of a simulated core melt with concrete were done. Two aerosol-sampling stations and the off-gas aerosol filter system were handled. In the last experiment 1,5 kg of aerosol mass were filtered. (orig./DG).

6737 (KFK–4850, pp. 145-166) **Development of methods for assessing and reducing the radiological consequences of nuclear accidents.** Burkart, K. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik); Commard, A.C.; Ehrhardt, J.; Faude, D.; Fischer, F.; Hasemann, I.; Kazakis, I.; Paesler-Sauer, J.; Qu, J.; Steinhauer, C.; Kunze, R.; Meyer, D.; RaKernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

The program package COSYMA (Code system from MARIA) for assessing the off-site consequences of accidental releases of radioactivity from nuclear installations to atmosphere has been completed in cooperation with NRPB (U.K.). The development of the computer-aided decision support system RESY was concentrated on the completion of the hardware and the coding of the framework system BASY. Based on the operation system UNIX, service programs control and maintain the data flow and the access to the various subsystems, and allow the communication with the user via X-window graphic terminals. The Gaussian-puff models ATSTEP has been developed for calculating actual and forecasted time and space dependent concentration fields based on predicted meteorological data. After its implementation into the subsystem RSY, activity concentration and potential organ dose fields can be updated in a 10 min interval and presented in the form of isolines or contamination patterns. (orig./DG).

6738 (KFK–4850, pp. 228-252) **Investigations of the reflooding behaviour in tight lattice rod bundles in the frame of the FLORESTAN-program.** Wiehr, K. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Reaktorbauelemente); Erbacher, F.J.; Just, W.; Schmidt, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes results of forced feed flooding experiments gained on a wider triangular lattice rod bundle. The rod pitch over diameter ratio (p/d) is 1.24. This type of bundle represents a fuel element design of a homogenous APWR. The test bundle consists of 61 fuel rod simulators with Zircaloy-claddings and special grid spacers for a triangular lattice. The heater of the fuel rod simulator is characterized by a cosine shaped axial power profile with a power peaking factor of 1.3 and a heated length of about two meters. The results show that the thermal hydraulic behavior of such an array under forced feed flooding conditions is simular to that of a PWR-geometry. (orig./DG).

6739 (KFK–4850, pp. 253-260) **Long term coolability of a core melt.** Alsmeyer, H. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Reaktorbauelemente); Schneider, H.; Tromm, W. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

One of the problems which must be solved in severe accidents is the melt concrete interaction which does occur when the core debris penetrates the lower pressure vessel head and contacts the basement. To prevent these accident consequences a core catcher concept is proposed to be integrated into the new PWR design. The core catcher consists of a perforated steel plate covered with a sacrificial layer and is connected with the basement by a supporting structure. In case of an accident the interfacial gap under the bottom plate is filled with sumpwater. In the sacrificial layer melt plugs are inserted which are the extension of the holes in the bottom steel plate. When the core melt erodes the layer, the plugs open by melting, and water/steam flow through the plugs and the melt starts. This continuous cooling stabilizes the melt and finally allows flooding of the upper melt surface. In order to identify the dominant processes during flooding of the melt from the bottom, two prototypic experiments in laboratory scale have been carried out. (orig.).

6740 (KFK–4891) **Experiments on thermal interactions: Tests with Al_2O_3 droplets and water.** Peppler, W.; Till, W.; Kaiser, A. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Reaktorentwicklung (IRE); Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Sep 1991. 91p. Order Number DE92750188. Source: OSTI; NTIS (US Sales Only); INIS.

Within the analysis of severe highly hypothetical fast breeder accidents the consequences of a fuel-coolant interaction have to be considered, i.e. the thermal interaction between hot molten fuel and sodium. To improve principal knowledge on the fragmentation process during the interaction of a hot droplet with a cold fluid, a series of experiments was performed with single droplets of molten Al_2O_3 as the hot liquid and water as the cold and easily volatile fluid. To initiate fragmentation of the droplet pressure pulses of up to 1 MPa were generated in the water by a magnetic hammer. The events were filmed by a high speed camera with up to 10^5 pictures per second. Details of the interactions can be deduced from the films and from the pressure histories. The existence of a vapour trail in all experiments indicates complex heat and mass transfer processes occurring in the vapour film spontaneously formed between droplet and cold fluid. Fragmentation was initiated by local events in the vapour trail area. (orig.).

6741 (NUREG–0847-Suppl.7) **Safety evaluation report related to the operation of Watts Bar Nuclear Plant, Units 1 and 2 (Docket Nos. 50-390 and 50-391): Supplement No. 7.** Tam, P.S. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Reactor Projects I/II. Sep 1991. 59p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

This report supplements the Safety Evaluation Report (SER), NUREG- 0847 (June 1982), Supplement No. 1 (September 1982), Supplement No. 2 (January 1984), Supplement No. 3 (January 1985), Supplement No. 4 (March 1985), Supplement No. 5 (November 1990), and Supplement No. 6 (April 1991) issued by the Office of Nuclear Reactor Regulation of the US Nuclear Regulatory Commission with respect to the application filed by the Tennessee Valley Authority, as applicant and owner, for licenses to operate the Watts Bar Nuclear Plant, Units 1 and 2 (Docket Nos. 50-390 and 50-391). The facility is located in Rhea County, Tennessee, near the Watts Bar Dam on the Tennessee River. This supplement provides recent information regarding resolution of some of the outstanding and confirmatory items, and proposed license conditions identified in the SER.

6742 (NUREG–1435-Suppl.1) **Status of safety issues at licensed power plants: TMI action plan requirements, unresolved safety issues, generic safety issues: Supplement 1.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Dec 1991. 101p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

As part of ongoing US Nuclear Regulatory Commission (NRC) efforts to ensure the quality and accountability of safety issue information, a program was established whereby an annual NUREG report would be published on the status of licensee implementation and NRC verification of safety issues in major NRC requirements areas. This information was compiled and reported in three NUREG volumes. Volume 1, published in March 1991, addressed the status of of Three Mile Island (TMI) Action Plan Requirements. Volume 2, published in May 1991, addressed the status of unresolved safety issues (USIs). Volume 3, published in June 1991, addressed the implementation and verification status of generic safety issues (GSIs). This annual NUREG report combines these volumes into a single report and provides updated information as of September 30, 1991. The data contained in these NUREG reports are a product of the NRC's Safety Issues Management System (SIMS) database, which is maintained by the Project Management Staff in the Office of Nuclear Reactor Regulation and by NRC regional personnel. This report is to provide a comprehensive description of the implementation and verification status of TMI Action Plan Requirements, safety issues designated as USIs, and GSIs that have been resolved and involve implementation of an action or actions by licensees. This report makes the information available to other interested parties, including the public. An additional purpose of this NUREG report is to serve as a follow-on to NUREG-0933, "A Prioritization of Generic Safety Issues," which tracks safety issues up until requirements are approved for imposition at licensed plants or until the NRC issues a request for action by licensees.

6743 (NUREG/CP–0114-Vol.2, pp. 433-448) **Failure of PWR-RHRS under cold shutdown conditions: Experimental results from the PKL test facility.** Mandl, R.M. (Siemens AG, Erlangen (West Germany)); Umminger, K.J.; Logt, J.V.D. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Brookhaven National Lab., Upton, NY (United States). Apr 1991. (CONF-9010185–Vol.2: 18. water reactor safety information meeting, Rockville, MD (United States), 22-24 Oct 1990). In *Eighteenth water reactor safety information meeting. Volume 2, Severe accident research, accident management, probabilistic risk assessment topics, individual plant examination program and other issues.* 578p. Source: OSTI; NTIS; INIS; GPO.

The Residual Heat Removal System (RHRS) of a PWR is designed to transfer thermal energy from the core after plant shutdown and maintain the plant in cold shutdown or refuelling conditions for extended periods of time. Initial reactor cooling after shutdown is achieved by dissipating heat through the steam generators (SGs) and discharging steam to the condenser by means of the Turbine Bypass System (TBS). When the reactor coolant temperature has dropped to about 160C and pressure has been reduced to 30 bar the RHRS is placed into operation. it reduces the coolant temperature to 50C within 20 hours after shutdown. The time margin for establishing alternate methods of heat removal following a failure of the RHRS depends on the Reactor Coolant System (RCS) temperature, the decay heat rate and the amount of RCS inventory. During some shutdown operations the RCS may be partially drained (e. g. to perform SG inspections). Decreased primary system inventory can significantly reduce the time available to recover the RHRS's function prior to bulk boiling and possible core uncovery. In the PKL test facility, which simulates a 1,300 MWe 4-loop PWR on a scale 1:145, a failure of RHRS under cold shutdown conditions was performed. This presentation gives a brief description of the test facility followed by the test objectives and results of this experiment.

6744 (NUREG/CR–5382) **Screening of generic safety issues for license renewal considerations.** Faramarzi, A. (Mitre Corp., McLean, VA (United States)); Hughes, A.A.; Seth, S.S. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; Mitre Corp., McLean, VA (United States). Dec 1991. 74p. Sponsored by Nuclear Regulatory Commission. (MTR–90W00467). Source: OSTI; NTIS; INIS; GPO.

The US Nuclear Regulatory Commission (NRC) is developing regulations for renewing the operating licenses of nuclear power plants to ensure that they operate safely beyond the present license terms of 40 years. One consideration relates to past resolutions of generic safety issues (GSIs) that did not result in backfit requirements on the licensees. The consideration of an additional operating term of 20 years which the proposed license renewal rule allows, could have retrospective implication for the basis of those GSI resolutions. As part of its technical support to the NRC for the development of license renewal regulations. MITRE has performed an independent review of the GSIs to identify those that could be potentially affected by license renewal considerations. This report describes the screening process and the results of that work.

6745 (NUREG/CR–5520) **Procedures guide for extracting and loading probabilistic risk assessment data into MAR-D using IRRAS 2.5.** Fowler, R.D. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Judd, D.L.; Pham, M.; VanHorn, R.L.; Wolfram, L.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; EG and G Idaho, Inc., Idaho Falls, ID (United States). Nov 1991. 99p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC07-76ID01570. (EGG–2630). Source: OSTI; NTIS; GPO.

The Models and Results Data Base (MAR-D) can be used to organize information from probabilistic risk assessments (PRAs). Data may be entered into MAR-D electronically or manually. This report concentrates on manual data-entry methods and documents the use of the Integrated Reliability and Risk Analysis System (IRRAS), Version 2.5, and ASCII text editors to load level 1 (internal event) PRA models into MAR-D. Step-by-step instructions for using IRRAS 2.5 are provided, which will help the user transfer data from a printed (hardcopy) source to MAR-D.

6746 (NUREG/CR–5623) **BWR Mark II ex-vessel corium interaction analyses.** Greene, S.R. (Oak Ridge National Lab., TN (United States)); Levin, A.E.; Hyman, C.R.; Sozer, A.; Taleyarkhan, R.P. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; Oak Ridge National Lab., TN (United States). Nov 1991. 214p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. (ORNL/TM–11644). Source: OSTI; NTIS; INIS; GPO.

This report describes the results of a series of studies conducted to investigate the behavior of core debris within a BWR Mark II containment. These studies focused on the interaction of core debris with concrete and steel structures (downcomers and inpedestal floor drains) within the drywell, the transport of debris through these drains and downcomers into the wetwell, and on debris-water reactions within the wetwell. Estimates of the conditions under which debris would penetrate the in-pedestal drain lines, the time-dependent behavior of the debris within the drain lines, and the amount of debris which might enter the suppression pool via these drain lines are provided. An assessment of the conditions under which the upper lip of the downcomers would be expected to fail (i.e. melt) due to exposure to hot core debris is presented. Finally, the unique characteristics of debris water interactions in Mark II containments are discussed, the existing knowledge base regarding core-concrete debris-water interactions is summarized, and an evaluation of the applicability of the MELCOR 1.80 code's debris-water interaction model to BWR Mark II's is presented.

6747 (NUREG/CR–5712) **MORECA: A computer code for simulating modular high-temperature gas-cooled reactor core heatup accidents.** Ball, S.J. (Oak Ridge National Lab., TN (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Oak Ridge National Lab., TN (United States). Oct 1991. 63p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. (ORNL/TM–11823). Source: OSTI; NTIS; INIS; GPO.

The design features of the modular high-temperature gas-cooled reactor (MHTGR) have the potential to make it essentially invulnerable to damage from postulated core heatup accidents. This report describes the ORNL MORECA code, which was developed for analyzing postulated long-term core heatup scenarios for which active cooling systems used to remove afterheat following the accidents can be assumed to the unavailable. Simulations of long-term loss-of-forced-convection accidents, both with and without depressurization of the primary coolant, have shown that maximum core temperatures stay below the point at which any significant fuel failures and fission product releases are expected. Sensitivity studies also have been done to determine the effects of errors in the predictions due both to uncertainties in the modeling and to the assumptions about operational parameters. MORECA models the US Department of Energy reference design of a standard MHTGR.

6748 (NUREG/CR–5728) **Experiments to investigate the effect of flight path on direct containment heating (DCH) in the Surtsey test facility: The Limited Flight Path (LFP) tests.** Allen, M.D. (Sandia National Labs., Albuquerque, NM (United States)); Pilch, M.; Griffith, R.O.; Nichols, R.T. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Sandia National Labs., Albuquerque, NM (United States). Oct 1991. 97p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (SAND–91-1105). Source: OSTI; NTIS; INIS; GPO.

The goal of the Limited Flight Path (LFP) test series was to investigate the effect of reactor subcompartment flight path length on direct containment heating (DCH). The test series consisted of eight experiments with nominal flight paths of 1, 2, or 8 m. A thermitically generated mixture of iron, chromium, and alumina simulated the corium melt of a severe reactor accident. After thermite ignition, superheated steam forcibly ejected the molten debris into a 1:10 linear scale the model of a dry reactor cavity. The blowdown steam entrained the molten debris and dispersed it into the Surtsey vessel. The vessel pressure, gas temperature, debris temperature, hydrogen produced by steam/metal reactions, debris velocity, mass dispersed into the Surtsey vessel, and debris particle size were measured for each experiment. The measured peak pressure for each experiment was normalized by the total amount of energy introduced into the Surtsey vessel; the normalized pressures increased with lengthened flight path. The debris temperature at the cavity exit was about 2320 K. Gas grab samples indicated that steam in the cavity reacted rapidly to form hydrogen, so the driving gas was a mixture of steam and hydrogen. These experiments indicate that debris may be trapped in reactor subcompartments and thus will not efficiently transfer heat to gas in the upper dome of a containment building. The effect of deentrainment by reactor subcompartments may significantly reduce the peak containment load in a severe reactor accident. 8 refs., 49 figs., 6 tabs.

6749 (NUREG/CR–5765) **SPARC-90: A code for calculating fission product capture in suppression pools.** Owczarski, P.C. (Pacific Northwest Lab., Richland, WA (United States)); Burk, K.W. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 81p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. (PNL–7723). Source: OSTI; NTIS; INIS; GPO.

This report describes the technical bases and use of two updated versions of a computer code initially developed to serve as a tool for calculating aerosol particle retention in boiling water reactor (BWR) pressure suppression pools during severe accidents, SPARC-87 and SPARC-90. The most recent version is SPARC-90. The initial or prototype version (Owczarski, Postma, and Schreck 1985) was improved to include the following: rigorous treatment of local particle deposition velocities on the surface of oblate spherical bubbles, new correlations for hydrodynamic behavior of bubble swarms, models for aerosol particle growth, both mechanistic and empirical models for vent exit region scrubbing, specific models for hydrodynamics of bubble breakup at various vent types, and models for capture of vapor iodine species. A complete user's guide is provided for SPARC-90 (along with SPARC-87). A code description, code operating instructions, partial code listing, examples of the use of SPARC-90, and summaries of experimental data comparison studies also support the use of SPARC-90. 29 refs., 4 figs., 11 tabs.

6750 (NUREG/CR–5781) **Summary of a workshop on severe accident management for PWRs.** Kastenberg, W.E. (ed.) (California Univ., Los Angeles, CA (United States). Dept. of Mechanical, Aerospace and Nuclear Engineer); Apostolakis, G.; Jae, M.; Milici, T.; Park, H.; Xing, L.; Dhir, V.K.; Lim, H.; Okrent, D.; Swider, J.; Yu, D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; California Univ., Los Angeles, CA (United States). Dept. of Mechanical, Aerospace and Nuclear Engineering. Nov 1991. 53p. Sponsored by Nuclear Regulatory Commission. Source: OSTI; NTIS; INIS; GPO.

Severe accident management can be defined as the use of existing and/or alternative resources, systems and actions to prevent or mitigate a core-melt accident. For each accident sequence and each combination of strategy, there may be several options available to the operator; and each involves phenomenological and operational considerations regarding uncertainty. Operational uncertainty includes operator, system and instrument behavior during severe accidents. During the period May 15–17, 1990 a workshop was held at the University of California, Los Angeles, to address these uncertainties for pressurized water reactors (PWRs). This report contains a summary of the workshop proceedings.

6751 (ORNL/TM–11907) **Worldwide advanced nuclear power reactors with passive and inherent safety: What, why, how, and who.** Forsberg, C.W.; Reich, W.J. Oak Ridge National Lab., TN (United States). Sep 1991. 103p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE92002401. Source: OSTI; NTIS; INIS; GPO Dep.

The political controversy over nuclear power, the accidents at Three Mile Island (TMI) and Chernobyl, international competition, concerns about the carbon dioxide greenhouse effect and technical breakthroughs have resulted in a segment of the nuclear industry examining power reactor concepts with PRIME safety characteristics. PRIME is an acronym for Passive safety, Resilience, Inherent safety, Malevolence resistance, and Extended time after initiation of an accident for external help. The basic ideal of PRIME is to develop power reactors in which operator error, internal sabotage, or external assault do not cause a significant release of radioactivity to the environment. Several PRIME reactor concepts are being considered. In each case, an existing, proven power reactor technology is combined with radical innovations in selected plant components and in the safety philosophy. The Process Inherent Ultimate Safety (PIUS) reactor is a modified pressurized-water reactor, the Modular High Temperature Gas-Cooled Reactor (MHTGR) is a modified gas-cooled reactor, and the Advanced CANDU Project is a modified heavy-water reactor. In addition to the reactor concepts, there is parallel work on super containments. The objective is the development of a passive "box" that can contain radioactivity in the event of any type of accident. This report briefly examines: why a segment of the nuclear power community is taking this new direction, how it differs from earlier directions, and what technical options are being considered. A more detailed description of which countries and reactor vendors have undertaken activities follows. 41 refs.

6752 **Robot arm apparatus.** Nachbar, H.D. To Dept. of Energy. 1990. Filed date 2 Jul 1990. USA Patent patent application

7-546,827. 21p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC12-76SN00052. Order Number DE92003817. Source: OSTI; NTIS; GPO Dep.

A robot arm apparatus is provided for inspecting and/or maintaining an interior of a steam generator which has an outside wall and a port for accessing the interior of the steam generator. The robot arm apparatus includes a flexible movable conduit for conveying inspection and/or maintenance apparatus from outside the steam generator to the interior of the steam generator. The flexible conduit has a terminal working end which is translated into and around the interior of the steam generator. Three motors located outside the steam generator are employed for moving the terminal working end inside the steam generator in "x," "y," and "z" directions, respectively. Commonly conducted inspection and maintenance operations include visual inspection for damaged areas, water jet lancing for cleaning sludge deposits, core boring for obtaining sludge deposits, and scrubbing of internal parts.

6753 **Nuclear qualified in-containment electrical connectors and methods of connecting electrical conductors.** Powell, J.G. To Dept. of Energy. 1990. Filed date 9 Jul 1990. USA Patent patent application 7-549,982. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC12-76SN00052. Order Number DE92003820. Source: OSTI; NTIS; GPO Dep.

A nuclear qualified in-containment electrical connection comprises an insulated, sheathed instrument lead having electrical conductors extending from one end thereof to provide two exposed lead wires, a watertight cable having electrical conducting wires therein and extending from one end of the cable to provide two lead wires therefrom, two butt splice connectors each connecting the ends of respective ones of the lead wires from the instrument lead and cable, a length of heat shrinkable plastic tubing positioned over each butt splice connector and an adjacent portion of a respective lead wire from the cable and heat shrunk into position, a length of heat shrinkable plastic tubing on the end portion of the instrument lead adjacent the lead wires therefrom and heat shrunk thereon and a length of outer heat shrinkable plastic tubing extending over the end portion of the instrument lead and the heat shrinkable tubing thereon and over the butt splice connectors and a portion of the cable adjacent the cable lead lines, the outer heat shrinkable tubing being heat shrunk into sealing position on the instrument lead and cable.

6754 (SAND–91-1397C) **Aging, condition monitoring, and loss-of-coolant accident (LOCA) tests of Class 1E electrical cables: Summary of results.** Jacobus, M.J. Sandia National Labs., Albuquerque, NM (United States). [1991]. 16p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (CONF-911079–12: 19. Nuclear Regulatory Commission (NRC) water reactor safety information meeting, Bethesda, MD (United States), 28-30 Oct 1991). Order Number DE92003615. Source: OSTI; NTIS; INIS; GPO Dep.

This paper summarizes the results of aging, condition monitoring, and accident testing of Class 1E cables used in nuclear power generating stations. Three sets of cables were aged for up to 9 months under simultaneous thermal (≃ 100°C) and radiation (≃0.10 kGy/hr) conditions. After the aging, the cables were exposed to a simulated accident consisting of high dose rate irradiation (≃6 kGy/hr) followed by a high temperature steam exposure. A fourth set of cables, which were unaged, were also exposed to the accident conditions. The cables that were aged for 3 months and then accident tested were subsequently exposed to a high temperature steam fragility test (up to 400°C), while the cables that were aged for 6 months and then accident tested were subsequently exposed to a 1000-hour submergence test in a chemical solution. The results of the tests indicate that the feasibility of life extension of many popular nuclear power plant cable products is promising and that mechanical measurements (primarily elongation, modulus, and density) were more effective than electrical measurements for monitoring age-related degradation. In the high temperature steam test, ethylene propylene rubber (EPR) cable materials generally survived to higher temperatures than crosslinked polyolefin (XLPO) cable materials. In dielectric testing after the submergence testing, the XLPO materials performed better than the EPR materials. This paper presents some recent experimental data that are not yet available elsewhere and a summary of findings from the entire experimental program.

6755 (SAND–91-1459C) **An approach for assessing ALWR passive safety system reliability.** Hake, T.M. Sandia National Labs., Albuquerque, NM (United States). [1991]. 17p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (CONF-911079–15: 19. Nuclear Regulatory Commission (NRC) water reactor safety information meeting, Bethesda, MD (United States), 28-30 Oct 1991). Order Number DE92004013. Source: OSTI; NTIS; INIS; GPO Dep.

Many advanced light water reactor designs incorporate passive rather than active safety features for front-line accident response. A method for evaluating the reliability of these passive systems in the context of probabilistic risk assessment has been developed at Sandia National Laboratories. This method addresses both the component (e.g. valve) failure aspect of passive system failure, and uncertainties in system success criteria arising from uncertainties in the system's underlying physical processes. These processes provide the system's driving force; examples are natural circulation and gravity-induced injection. This paper describes the method, and provides some preliminary results of application of the approach to the Westinghouse AP600 design.

6756 (SAND–91-1610C) **Status of the low power and shutdown accident sequence analysis project for the Grand Gulf Nuclear Power Station.** Whitehead, D.W. (Sandia National Labs., Albuquerque, NM (United States)); Staple, B.E.; Brown, T.D.; Darby, J.; Walsh, B. Sandia National Labs., Albuquerque, NM (United States). [1991]. 14p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (CONF-911079–11: 19. Nuclear Regulatory Commission (NRC) water reactor safety information meeting, Bethesda, MD (United States), 28-30 Oct 1991). Order Number DE92003617. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the current status of Phase 1 and 1A of the BWR Low Power and Shutdown Accident Frequencies Program being conducted at Sandia National Laboratories for the US Nuclear Regulatory Commission. The major focus of the project to date has been the identification and coarse screening quantification of accident sequences initiated in modes of operation other than full power. The coarse screening provides a filtering mechanism whereby the potentially important accident sequences are identified. The information obtained during these two phases will be used to prioritize the more detailed analyses which will occur during Phase 2 of this project. A summarization of the project including results and insights from Phase 1 and 1A is presented. 2 refs., 5 figs.

6757 (SAND–91-2407C) **Adiabatic equilibrium models for direct containment heating.** Pilch, M.M. Sandia National Labs., Albuquerque, NM (United States). [1991]. 16p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (CONF-9110210–3: 1991 water reactor safety meeting, Washington, DC (United States), 28-30 Oct 1991). Order Number DE92004729. Source: OSTI; NTIS; INIS; GPO Dep.

PRA studies are being extended to include a wider spectrum of reactor plants than was considered in NUREG-1150. There is a need for computationally simple models for Direct Containment Heating (DCH) that could be used for screening studies aimed at identifying potentially significant contributors to risk. This paper discusses two adiabatic equilibrium models that are candidates for the task. The first, a 1-cell model, places a true upper bound on DCH loads. This upper bound, however, often far exceeds reasonable expectations of containment loads based on best estimate CONTAIN calculations or experiment observations. In this paper, a 2-cell model is developed that largely captures the major mitigating features of containment compartmentalization, thus providing more reasonable estimates of the containment load. Predictions of the equilibrium models are compared with experiment data from the Limited Flight Path (LFP) test series conducted at Sandia National Laboratories.

6758 (SAND–91-2461C) **Initial performance assessment of the Westinghouse AP600 containment design and related safety issues.** Tills, J.L. (Tills (Jack) and Associates, Inc., Albuquerque, NM (United States)); Washington, K.E.; Nicolette, V.F. Sandia National Labs., Albuquerque, NM (United States). [1991].

22p. Sponsored by Nuclear Regulatory Commission. DOE Contract AC04-76DP00789. (CONF-9110210–2: 1991 water reactor safety meeting, Washington, DC (United States), 28-30 Oct 1991). Order Number DE92004743. Source: OSTI; NTIS; INIS; GPO Dep.

The CONTAIN code is currently being used to predict containment thermal hydraulic conditions during design basis and severe accidents for advanced light water reactor (ALWR) designs such as the Westinghouse AP600. In the AP600 design, a passive containment cooling system (PCCS) is used for reducing long-term overpressure during accidents. CONTAIN models for heat and mass transfer within the AP600 containment and outer air cooling channel are verified by comparing recent CONTAIN calculations to integral test data obtained by Westinghouse in their PCCS Integral Test Facility. The comparison includes test in which the outer containment wall is both dry and wet, that is, the wet tests involve an evaporative water film that enhances heat transfer as will be the case for AP600. The appropriateness of the heat and mass transfer analogy methodology used in the CONTAIN code is demonstrated. Code model limitations are discussed along with model development plans and applications for AP600.

6759 (SAND–91-2613C) **The Integral Effects Test (IET-1) in the Surtsey Test Facility.** Allen, M.D.; Griffith, R.O.; Pilch, M.M.; Nichols, R.T. Sandia National Labs., Albuquerque, NM (United States). [1991]. 25p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC04-76DP00789. (CONF-9110210–4: 1991 water reactor safety meeting, Washington, DC (United States), 28-30 Oct 1991). Order Number DE92004355. Source: OSTI; NTIS; INIS; GPO Dep.

The first experiment of the Integral Effects Test (IET-1) series was conducted to investigate the effects of high pressure melt ejection (HPME) on direct containment heating (DCH). A 1:10 linear scale model of the Zion reactor pressure vessel (RPV), cavity, instrument tunnel, and subcompartment structures were constructed in the Surtsey Test Facility at Sandia National Laboratories (SNL). The RPV was modelled with a melt generator that consisted of a steel pressure barrier, a cast MgO crucible, and a thin steel inner liner. The melt generator/crucible had a semi-hemispherical bottom head containing a graphite limitor plate with a 3.5 cm exit hole to simulate the ablated hole in the RPV bottom head that would be formed by tube ejection in a severe nuclear power plant (NPP) accident. The reactor cavity model contained 3.48 kg of water with a depth of 0.9 cm that corresponded to condensate levels in the Zion plant. A steam driven iron oxide/aluminum/chromium thermite was used to simulate HPME. A relatively small steam explosion occurred in the cavity during IET-1. Steam blowthrough entrained debris into the Surtsey vessel resulting in a peak pressure increase in Surtsey of 98 kPa. The Surtsey vessel had been previously inerted with N_2. The total debris mass ejected into the Surtsey vessel was 43 kg. The hydrogen concentration was 3.1 mol.% in the vessel at equilibrium. The concentration measured inside the subcompartment structures immediately following HPME transient was 20.7 mol.% H_2. 4 refs., 17 figs., 5 tabs.

6760 (UNI–785) **N Reactor ACRS briefing report, 1968–1976.** United Nuclear Industries, Inc., Richland, WA (United States). Jun 1977. 120p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE92001748. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This ACRS Briefing Report is intended to appraise the Advisory Committee on Reactor Safeguards of items pertaining to the safety of the Hanford N Reactor. The first portion of the report briefly describes the reactor and its engineered safety systems. The balance of the report describes the significant plant modifications and operating experiences important to safety since the last ACRS Report in 1968. The starting date for this report was selected as the date of the last ACRS Report to assure adequate overlap and continuity of information. Later meetings to discuss specific topics related to N Reactor operation were held with the ACRS Hanford Subcommittee in August 1970. The portion of the report pertinent to safety of operations covers the Status of the Effluent Control Program, Plant Modifications Since the Effluent Control Program, Recent Regulatory Activities, and Operating Experiences Pertinent to Nuclear Safety. 23 refs., 12 figs., 3 tabs.

24 POWER TRANSMISSION AND DISTRIBUTION

2402 Power System Networks, Transmission and Distribution

6761 (CONF-920223–2) **MHD-EMP interaction with power transmission and distribution systems.** Tesche, F.M. (Tesche (F.M.), Dallas, TX (United States)); Barnes, P.R. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by U.S. DOE Conservation & Renewable Energy; U.S. Department of Defense. DOE Contract AC05-84OR21400. From 1992 hardened electronics and radiation technology (HEART) conference; Albuquerque, NM (United States); 24-28 Feb 1992. Order Number DE92003541. Source: OSTI; NTIS; GPO Dep.

A nuclear detonation at altitudes of several hundred kilometers above the earth will distort the earth's magnetic field and results in a time-variation of the geomagnetic field on the earth's surface. This magnetic field interacts with the finitely conducting earth to produce a time varying electric field, also on the earth's surface. Known at the magnetohydrodynamic electromagnetic pulse (MHD-EMP), this resulting E-field can induce a net voltage in long electrical conductors, such as power transmission lines. If these conductors are electrically connected to the earth at both ends, a current can be induced to flow in the conductors, and this can cause damage or upset to certain electrical systems. This paper presents the results of a study on the interaction of the MHD-EMP with power transmission and distribution (T&D) systems. A brief overview of the MHD-EMP environment used in the study is presented, and the analytical models used for estimating the coupling of this environment to T&D lines are discussed. Because of the quasi-static nature of MHD-EMP, the models are essentially simple DC circuit models. However, complications arise in attempting to treat realistic line configurations having a large number of support towers and an overhead shield or neutral wires. There models are discussed in detail. 3 refs., 5 figs., 1 tab.

6762 **Wedge assembly for electrical transformer component spacing.** Baggett, F.E.; Cage, W.F. To Dept. of Energy. 1990. Filed date 4 Jun 1991. USA Patent patent application 7-532,545. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92003742. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a wedge assembly that is easily inserted between two surface to be supported thereby, and thereafter expanded to produce a selected spacing between those surfaces. This wedge assembly has two outer members that are substantially identical except that they are mirror images of each other. Oppositely directed faces of these of these outer members are substantially parallel for the purpose of contacting the surfaces to be separated. The other faces of these outer members that are directed toward each other are tapered so as to contact a center member having complementary tapers on both faces. A washer member is provided to contact a common end of the outer members, and a bolt member penetrates this washer and is threadably received in a receptor of the center member. As the bolt member is threaded into the center member, the center member is drawn further into the gap between the outer members and thereby separates these outer members to contact the surfaces to be separated. In the preferred embodiment, the contacting surfaces of the outer member and the center member are provided with guide elements. The wedge assembly is described for use in separating the secondary windings from the laminations of an electrical power transformer.

2403 Power Transmission Lines and Cables

6763 (BNL–46823) **Ac losses in $YBa_2Cu_3O_7$ and $Bi_2Sr_2Ca_2Cl_3O_{10}$ superconductors at power frequencies.** Orehotsky, J. (Brookhaven National Lab., Upton, NY (United States)); Reilly, K.M.; Suenaga, M.; Hikata, T.; Ueyama, M.; Sato, K. Brookhaven National Lab., Upton, NY (United States). [1991]. 4p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-76CH00016. (CONF-911096–5: 4. international symposium on superconductivity, Tokyo (Japan), 14-17 Oct 1991). Order Number DE92004990. Source: OSTI; NTIS; GPO Dep.

Ac losses of sintered and melt-textured $YBa_2Cu_3O_7$ bars and powder-in-a-tube processed $Bi_2Sr_2Ca_2Cu_3O_{10}$ tapes were measured at 4.2, 65, 70 and 77 K and at 15–180 Hz. In general, the results are well described by the critical state model for the ac losses. However, the losses for the $Bi_2Sr_2Ca_2Cu_3O_{10}$ tapes at 4.2 K exhibited significant contributions from the eddy currents in the Ag sheath.

6764 (CONF-920202–2) **The effects of nonstandard lightning voltage waveshapes on the impulse strength of air gaps.** Chowdhuri, P. (Tennessee Technological Univ., Cookeville, TN (United States)); Mishra, A.K.; Martin, P.M.; McConnell, B.W. Oak Ridge National Lab., TN (United States). [1991]. 7p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From IEEE Power Engineering Society (PES) winter meeting; New York, NY (United States); 2-6 Feb 1992. Order Number DE92003530. Source: OSTI; NTIS; GPO Dep.

Sphere-sphere, rod-rod and rod-plane air gaps, each 5-cm long, were tested with lightning surges of eight voltage waveshapes of both polarities. The critical breakdown voltage of the tested air gaps showed a minima at a certain voltage wavefront. Long time delays of breakdown for the fast-front and short time delays for the slow-front waves were observed. These phenomena would significantly affect the insulation coordination of the power apparatus and system. 32 refs.

6765 **Lightning protection device for electrical lines.** Gazzola, C.; Gauchon, J.; Marichy, G. To Ferraz (France). 26 Aug 1991. Filed date 26 Feb 1990. Canada Patent patent application 2010951. 9p. (In French). Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

A lightning protection device for electrical lines, particularly medium-voltage overhead lines, is disclosed. The device is intended to overcome the disadvantages of currently known devices, such as susceptibility to attack by pollutants and damage during installation. According to the invention, the rigid tube which normally encloses the insulating element of such devices is cut by at least one port, while the enclosure is directly formed by molding upon the insulating element such that the synthetic resin used to form the enclosure penetrates to the inside of the tube and coats the stack of resistance elements which make up, along with the connector capsules, the insulating element. With a view to reinforcing the watertightness of the assembly, the extremities of the exterior enclosure made of molded resin are profiled to present a lip of circular profile which is oriented axially towards the exterior so as to engage a corresponding annular seating provided in each one of two metallic instrument forming contacts for the mounting of the lightning protection device. 6 figs.

25 ENERGY STORAGE

2501 Magnetic

6766 (ORNL/HTSPC–1) **Survey of domestic research on superconducting magnetic energy storage.** Dresner, L. Oak Ridge National Lab., TN (United States). Sep 1991. 31p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE92004108. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the results of a survey of domestic research on superconducting magnetic energy storage (SMES) undertaken with the support of the Oak Ridge National Laboratory (ORNL) Superconductivity Pilot Center. Each survey entry includes the following: Name, address, and other telephone and facsimile numbers of the principal investigator and other staff members; funding for fiscal year 1991, 1992, 1993; brief descriptions of the program, the technical progress to date, and the expected technical progress; a note on any other collaboration. Included with the survey are recommendations intended to help DOE decide how best to support SMES research and development (R&D). To summarize, I would say that important elements of a well-rounded SMES research program for DOE are as follows. (1) Construction of a large ETM. (2) Development of SMES as an enabling technology for solar and wind generation, especially in conjunction with the ETM program, if possible. (3) Development of small SMES units for electric networks, for rapid transit, and as noninterruptible power supplies [uses (2), (3), and (4) above]. In this connection, lightweight, fiber-reinforced polymer structures, which would be especially advantageous for space and transportation applications, should be developed. (4) Continued study of the potential impacts of high-temperature superconductors on SMES, with construction as soon as feasible of small SMES units using high-temperature superconductors (HTSs).

2509 Batteries

6767 (EGG-EP–9766) **Battery availability for near-term (1998) electric vehicles.** Burke, A.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1991. 48p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC07-76ID01570. Order Number DE92003331. Source: OSTI; NTIS; GPO Dep.

Battery Requirements were determined for a wide spectrum of electric vehicles ranging from 2-passenger sports cars and microvans to full-size vans with a payload of 500 kg. All the vehicles utilize ac, high voltage (340–360 V) powertrains and have acceleration performance (0–80 km/h in less than 15 seconds) expected to be the norm in 1988 electric vehicles. Battery packs were configured for each of the vehicles using families of sealed lead-acid and nickel-cadmium modules which are either presently available in limited quantities or are being developed by battery companies which market a similar battery technology. It was found that the battery families available encompass the Ah cell sizes required for the various vehicles and that they could be packaged in the space available in each vehicle. The acceleration performance and range of the vehicles were calculated using the SIMPLEV simulation program. The results showed that all the vehicles had the required acceleration characteristics and ranges between 80–160 km (50–100 miles) with the ranges using nickel-cadmium batteries being 40–60% greater than those using lead-acid batteries. Significant changes in the design of electric vehicles over the last fifteen years are noted. These changes make the design of the batteries more difficult by increasing the peak power density required from about 60 W/kg to 100–150 W/kg and by reducing the Ah cell size needed from about 150 Ah to 30–70 Ah. Both of these changes in battery specifications increase the difficulty of achieving low $/kWh cost and long cycle life. This true for both lead-acid and nickel-cadmium batteries. 25 refs., 6 figs., 16 tabs.

6768 (SAND–91-2529C) **Accelerated testing of batteries.** Levy, S.C. (Sandia National Labs., Albuquerque, NM (United States)); Bro, P. Sandia National Labs., Albuquerque, NM (United States). [1992]. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-920151–1: 7. annual battery conference on applications, Long Beach, CA (United States), 21-23 Jan 1992). Order Number DE92004739. Source: OSTI; NTIS; GPO Dep.

Three methods of evaluating accelerated battery test data are described. Criteria for each method are used to determine the minimum test matrix required for accurate predictions. Other test methods involving high current discharge and real time techniques are discussed.

6769 (SAND–91-2694) **Utility Battery Exploratory Technology Development Program report for FY91.** Magnani, N.J.; Butler, P.C.; Akhil, A.A.; Braithwaite, J.W.; Clark, N.H.; Freese, J.M. Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 117p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. Order Number DE92004854. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories, Albuquerque, manages the Utility Battery Exploratory Technology Development Program, which is sponsored by the US Department of Energy's Office of Energy Management. In this capacity, Sandia is responsible for the engineering analyses and development of rechargeable batteries for utility-energy-storage applications. This report details the technical achievements realized during fiscal year 1991. Sodium/Sulfur, Zinc/Bromine, Nickel/Hydrogen, Aluminium/Air and Lead/Acid batteries are evaluated.

6770 (TKK-KO/LTK-44) **Manufacture of air electrodes and long run tests.** Lamminen, J. (Helsinki Univ. of Technology, Otaniemi (Finland). Lab. of Thermal Engineering); Lampinen, M.J.; Viitanen, M.; Vuorisalo, J.; Kivisaari, J. Helsinki Univ. of Technology, Otaniemi (Finland). Lab. of Thermal Engineering. 1990. 11p. Order Number DE92728394. Source: OSTI; NTIS (US Sales Only).

NEMO Research Programme- Also available as PB-90-255126/XAB.

In this study some alternative catalysts for oxygen reduction in an alkaline electrolyte (7 M KOH) were tested. The catalysts tested were: CoTMPP, $LaNiO_3$, Pt (for comparison) and MnO_2. The electrodes were manufactured by the rolling method. The best electrodes made in this way has been tested in a long run test, testing times ranging from 425 hours to 660 hours. The decay in potential during the 660 hour run was 0.041 mV/h.

6771 **Universal electrolyte level indicator for wet cell batteries.** Dattilo, D.P. 22 Aug 1991. Filed date 22 Feb 1990. Canada Patent patent application 2010707. 28p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

An electrolyte level indicator is provided which may be attached to, and made part of, battery-powered mobile equipment of all types for the purposes of giving a warning indication to the operator of the equipment that water needs to be added to the batteries. The monitor of the invention includes a battery cap sensor probe that is inserted into a single cell of a wet-cell battery and electrically connected, through a single wire, to a panel-mounted transducer that indicates, by means of a flashing light-emitting diode, that the electrode is below an acceptable level, thereby producing a general indication that all the cells in the battery or batteries should be filled with water. 6 figs.

6772 **Manganese dioxide cathode for a rechargeable alkaline cell, and cell containing the same.** Tomantschger, K.; Michalowski, C.S. 15 Aug 1991. Filed date 15 Feb 1990. Canada Patent patent application 2010142. 36p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

In rechargeable manganese dioxide cells, usually alkaline cells with zinc anodes or cells having non-aqueous electrolyte and lithium anodes, the cathodes are essentially unconstrained; no cage is used in the cell between the cathodes and the anodes. The cathode is restricted from significantly changing its dimensions during discharge of the cell, when it is inclined to swell, as opposed to the tendency of the cathode to contract during a charge cycle. The cathode substantially fills the entire space alloted for it within the cell, with a slight accommodation for height-wise or longitudinal expansion or growth of the cathode of bobbin-type cells, or cross-wise expansion or growth of button-type cells. There may be additives in the cathode mix, including particularly conductive fibers of graphite or other conductive materials, and other materials including metallic additives. Methods of manufacture of the cathode include compaction and recompaction of the cathode pellet; a range of compaction pressures is suggested. Cells according to the invention are capable of exhibiting high current drain rates and long cycle life. Experiments are described to illustrate the invention. 2 figs.

29 ENERGY PLANNING AND POLICY

2902 Economics and Sociology

6773 (AFME-90-12-Doc) **Energy expenses: 1986-1989.** Agence Francaise pour la Maitrise de l'Energie, 75 - Paris (France). 1990. 47p. (In French). Order Number DE92743182. Source: OSTI; NTIS (US Sales Only).

Tables and diagrams of the different energies prices are presented for the period 1986-1989 in France. The energy overall bill is 83 billions FF in 1989, that is a 25 pc increase referred to 1988. Oil price has increased by 30pc; for the end-user, the increases were 20 pc for heavy gas oil, + 10 pc for domestic fuel oil, + 6 pc for motor fuel and propane. Coal price decreased by 5 pc, wood by 15 pc. Gas and electricity encountered lower variations (from -0.5 pc to + 1.5 pc).

6774 (CONF-9111144-2) **Gender differences: Let's see them in writing.** Boser, J.A. (Tennessee Univ., Knoxville, TN (United States)); Wiley, P.D.; Clark, S.B. Tennessee Univ., Knoxville, TN (United States); Oak Ridge Associated Universities, Inc., TN (United States). [1991]. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-76OR00033. From Annual meeting of the Mid-South Educational Research Association; Lexington, KY (United States); 13-15 Nov 1991. Order Number DE92004762. Source: OSTI; NTIS; GPO Dep.

Differences between males and females in the nature of their verbal communication have been documented. The findings of this study have provided a new dimensional to those of previous research. There is support for the idea that among college graduates with similar communication skills, females use written communication as a means of establishing rapport more than males. In a voluntary, relatively unstructured task, females tend to write longer responses and to express themselves by complete thoughts (sentences). Females are also more likely to use first person singular pronouns and first person singular possessive adjectives. There is no support in this situation for gender differences in offering solutions to described program weaknesses. The length of the open-ended responses describing weaknesses and strengths are more closely related to each other than they are to ratings of program satisfaction. This study was unique in that it was based on written communication of college graduates in a voluntary task. Differences in findings from of those of other studies may be due to experience and education of the participants. 7 refs., 2 tabs.

6775 (DOE/MI/10150-T1) **Factors affecting retention in science-based curriculums at HBCUs.** Pelham, J. Pennsylvania Univ., Philadelphia, PA (United States). [1991]. 56p. Sponsored by U.S. DOE Office of Minority Economic Impact. DOE Contract FG03-89MI10150. Order Number DE92005260. Source: OSTI; NTIS; GPO Dep.

A systematic and comprehensive study of the retention of minority students enrolled in college-level engineering was conducted. The majority of prior work in this area focused on institutional retention factors for students in non-specified majors and considered students "dropouts" whenever there was a break in enrollment. This study looked only at students whose beginning major was engineering, enrolled primarily at historically black colleges and universities (HBCUs), including a comparison sample from a predominantly white institution (PWI). Science persisters were defined as those students who continuously enrolled in post-secondary institutions full- and part-time – whether or not they transferred between institutions. The critical factor was their continued enrollment in engineering. Study participants provided four types of information: (1) a measure of academic motivation, (2) an objective measure of science interest, (3) a measure of nine aspects of normal personality functioning, and (4) an assessment of selected demographic variables. 64 refs.

6776 (DOE/NV/10384-65) **Archaeological data recovery at drill pad U19AX Nye County, Nevada: Technical report No. 65.** Henton, G.H.; Pippin, L.C. Nevada Univ., Las Vegas, NV (United States). Desert Research Inst. Dec 1991. 90p. Sponsored by U.S.

DOE Defense Programs. DOE Contract AC08-85NV10384. Order Number DE92004831. Source: OSTI; NTIS; GPO Dep.

At the Nevada Test Site, in the early spring of 1988, the Quaternary Sciences Center of the Desert Research Institute (DRI) conducted investigations at three archaeological sites near event site U19ax. These sites, recorded earlier during an archaeological reconnaissance of the event site as part of the environmental compliance activities, were determined eligible for the National Register of Historic Places (NRHP) and were in danger of being adversely impacted by construction activities or the effects of the underground test. The DRI proposed a plan of investigations which included controlled surface collections and excavations and, after concurrence of the Nevada Division of Historic Preservation and Archaeology (NDHPA) and the Advisory Council of Historic Preservation (ACHP), conducted the data recovery. The artifacts recovered from the surface scatter imply a long-duration, but low-intensity, use of the region for relatively general functions. The sites are interpreted as small temporary camps which overlay each other. The rockshelter appears to be a small temporary camp which was occupied twice, once historically, and once about 2,800 years ago. While these investigations mitigate most of the adverse impacts from the event at U19ax, significant archaeological sites still exist in the general vicinity and should further tests be conducted in the region, additional investigations may be warranted.

6777 (DOE/NV/10384–T1) **NTS American Indian Religious Freedom Act Compliance Program complying with AIRFA: A literature review and evaluation.** Pippin, L.C. Nevada Univ., Reno, NV (United States). Desert Research Inst. Sep 1991. 160p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-85NV10384. Order Number DE92004243. Source: OSTI; NTIS; GPO Dep.

The First Amendment to the United States Constitution guarantees the inherent right of all Americans to freedom of religion. However, since the religious practices of Native Americans are significantly different from those of the majority of Americans, their religious freedom has often restricted. Section 2 of the American Indian Religious Freedom Act (AIRFA) of 1978 (Public Law 95-341) directs federal agencies to consult with Native Americans to determine appropriate procedures to protect the inherent rights of Native Americans to believe, express, and exercise their traditional religions including, but not limited to access to sites, use and possession of sacred objects, and freedom to worship through ceremonials and traditional rites. The NTS AIRFA Compliance Program was initiated in October 1989 to assist DOE in expanding its compliance with AIRFA to incorporate all weapons testing activities on the NTS. It is directed at the development and implementation of a consultation plan designed to solicit, on behalf of DOE, Native American comments regarding the effects of the DOE's nuclear testing activities on historic properties of Native American origin and the expression and exercise of traditional Native American religions. The program has been developed around a phased approach that includes; (1) literature review and evaluation, (2) preparation of a baseline document, (3) preparation of a study design, (4) consultation with Native Americans, (5) preparation of a draft report, (6) Native American and State consultation and review, and (7) preparation of a final report.

6778 (DOE/NV/10845–66) **Inter and intrasite analyses of cultural materials from U20aw, Nye County, Nevada: Technical report No. 66.** Hicks, P.A.; Pippin, L.C.; Henton, G.H. Nevada Univ., Las Vegas, NV (United States). Desert Research Inst. Dec 1991. 186p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-90NV10845. Order Number DE92004832. Source: OSTI; NTIS; GPO Dep.

This archaeological presents the results of the analyses of the data derived from all sites investigated during the data recovery operations on Drill Hole U20aw on the Nevada Test Site, Nye County Nevada. These sites were determined to be potentially eligible for inclusion in the national Register of Historic Places. Detailed analyses were focused on the spatial distribution of artifacts and features within and between sites in the southern portion of the study area. These analyses indicate that one area served principally as a temporary camp, while the area around the canyonhead to the east seems to have been used as a site for both temporary camps and special activity loci. Projectile point styles suggest that the area was occupied from the Early Archaic into the early Historic period. Analyses of the artifacts that were recovered indicate that obsidian was the preferred material for all classes of flaked stone tools. All stages of lithic reduction are represented on the sites, but core reduction and thinning of bifaces appear to have been the primary activities. Processing of floral foods is indicated by the presence of several ground stone artifacts. Pinyon nuts and other items appear to have been stored in several areas as evidenced by the presence of several rock features that may have served as caches.

6779 (CONF-9110291–1) **Oak Ridge National Laboratory's philosophy and approach to NEPA.** Van Hook, R.I.; Braunstein, H.M.; Sigal, L.L.; Trettin, C.C. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Federal Construction Council symposium on dealing with environmental concerns in the comprehensive; Washington, DC (United States); 31 Oct 1991. Order Number DE92002810. Source: OSTI; NTIS; INIS; GPO Dep.

At Oak Ridge National Laboratory (ORNL), the overall responsibility for compliance with the National Environmental Policy Act (NEPA) resides with Environmental Review and Documentations Section that is within the Office of Environmental Compliance and Documentation (OECD). Organizationally, OECD is a line-management division reporting to the Director for Environmental, Safety and Health Compliance. The cornerstone for NEPA compliance at ORNL is the Internal Environmental Assessment (IEA), which is designed to provide a basis for NEPA review and documentation. The Standard Operating Procedures provide for evaluation and documentation records management and training, and auditing. The IEA provides a project description and a review of environmental, health and safety issues. The completed IEA is used to make recommendations to DOE regarding the appropriate level of NEPA documentation required for the action. NEPA documents which may be prepared include the Categorical Exclusion, Abbreviated Environmental Assessment, and Environmental Assessment; actions requiring Environmental Impact Statements are prepared by US Department of Energy (US DOE). The relatively recent DOE initiative for agency-wide compliance with NEPA has created areas in which ORNL has found itself lacking adequate resources and expertise. These are discussed in this paper. Throughout ORNL, there is strong management support for compliance with NEPA which has resulted in enhanced awareness and implementation of the NEPA requirements. Guidance is being provided and Laboratory divisions are factoring early integration of NEPA into their project planning with the goal of ensuring that their activities are carried out in full compliance with the letter and the spirit of NEPA and the other environmental statutes and regulations.

6780 (DOE/EH–0219) **Glossary of CERCLA-related terms and acronyms.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). RCRA/CERCLA Div. Oct 1991. 104p. Sponsored by U.S. DOE Environment Safety & Health. Source: OSTI (Free of Charge); INIS.

This glossary contains CERCLA-related terms that are most often encountered in the US Department of Energy (DOE) Environmental Restoration and Emergency Preparedness activities. Detailed definitions are included for key terms. The definitions included in this glossary are taken from the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), as amended, related federal rulemakings (e.g., 40 CFR 300, National Oil and Hazardous Substances Pollution Contingency Plan), assorted guidance documents prepared by the US Environmental Protection Agency (EPA), and DOE Order 5400.4. The source of each term is noted after the term. Terms presented in this document reflect revised and new definitions published before June 1, 1991. 20 refs.

6781 (DOE/EH–0220) **Federal environmental inspections handbook.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). RCRA/CERCLA Div. Oct 1991. 195p. Sponsored by U.S. DOE Environment Safety & Health. Source: OSTI (Free of Charge); INIS.

This Federal Environmental Inspection Handbook has been prepared by the Department of Energy (DOE), Office of Environmental Guidance, RCRA/CERCLA Division (EH-231). It is designed to provide DOE personnel with an easily accessible compilation of the environmental inspection requirements under Federal environmental statutes which may impact DOE operations and activities. DOE personnel are reminded that this Handbook is intended to be used in concert with, and not as a substitute for, the Code of Federal Regulations (CFR). Federal Register (FR), and other applicable regulatory documents.

6782 (DOE/EH–0227P) **OSHA training requirements for hazardous waste operations.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Dec 1991. 30p. Sponsored by U.S. DOE Environment Safety & Health. Order Number DE92004780. Source: OSTI; NTIS; GPO Dep.

This guidance addresses training requirements for personnel working, auditing, touring, and visiting DOE hazardous waste areas, including treatment, storage and disposal (TSD) facilities regulated under the Resource Conservation and Recovery Act (RCRA), and environmental restoration sites regulated under RCRA corrective action authority and/or the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). Applicable DOE Orders and the OSHA regulations should be consulted to ensure full compliance with all requirements.

6783 (EGG–10617-2093) **Environmental protection and regulatory compliance at the Elk Hills Field.** Chappelle, H.H. (BCM Engineers, Inc., Plymouth Meeting, PA (United States)); Donahoe, R.L.; Kato, T.T.; Ordway, H.E. EG and G Energy Measurements, Inc., Las Vegas, NV (United States). [1991]. 13p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC08-88NV10617. (SPE–22816;CONF-9110149–4: 66. annual Society of Petroleum Engineers (SPE) technical conference and exhibition, Dallas, TX (United States), 6-9 Oct 1991). Order Number DE92004366. Source: OSTI; NTIS; GPO Dep.

Environmental protection has played an integral role in the development and operation of the Elk Hills field since production at the maximum efficient rate was authorized in 1976. The field is located in a non-attainment area for California and National Ambient Air Quality Standards for two criteria pollutants and their associated precursors, is home to four endangered species, and operates within the California regulatory framework. Environmental protection and regulatory compliance is a multi-faceted program carried out through a substantial commitment of resources and workforce involvement. This paper describes the actions taken and resources employed to protect the environment, specific technologies and projects implement, and the ongoing nature of these efforts at Elk Hills.

6784 (ES/ER/TM–19) **Environmental Restoration Program Management Control Plan.** Oak Ridge National Lab., TN (United States). Sep 1991. 33p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. Order Number DE92003747. Source: OSTI; NTIS; INIS; GPO Dep.

This Management Control Plan has been prepared to define the Energy Systems approach to managing its participation in the US DOE's Environmental Restoration (ER) Program in a manner consistent with DOE/ORO 931: Management Plan for the DOE Field Office, Oak Ridge, Decontamination and Decommissioning Program; and the Energy Systems Environmental Restoration Contract Management Plan (CMP). This plan discusses the systems, procedures, methodology, and controls to be used by the program management team to attain these objectives.

6785 (IC–90/239) **The greenhouse effect.** Choudhury, A.M. International Centre for Theoretical Physics, Trieste (Italy). Oct 1990. 14p. Order Number DE92613622. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper, the effect of the increase of the temperature of the earth's atmosphere as a consequence of the increase in the CO_2 and other trace gas content has been reviewed. The results of various model studies have been included. There is the frightening prediction that global mean temperature will rise by several degrees with the consequent rise of mean sea level. Model computations also show that in the tropics rainfall will increase whereas in the subtropics and southern mid latitude, rainfall will decrease. If this happens, mankind will be faced with a major disaster in history. Agreement between theory and observations has been discussed. (author). 16 refs, 8 tabs.

6786 (INIS-mf–13043) **Climatic and other global effects of nuclear war: Summary of a United Nations study.** Disarmament facts. United Nations, New York, NY (USA). Dept. for Disarmament Affairs. Jan 1989 15p. Order Number DE92613623. Source: OSTI; NTIS (US Sales Only); INIS.

Published in the official languages of the United Nations.

A major nuclear war would entail the high risk of disruption to the global environment, and the risk would be greatest if large cities and industrial centres in the northern hemisphere were to be targeted in the summer months. The report of the UN Study Group confirms that a nuclear war could not be won and must not be fought, and thus makes a strong argument for the pursuit of sharp reductions in, and the ultimate eradication of, nuclear weapons.

6787 (Juel–2495) **The verification of international conventions on protection of the environment and common resources. A comparative analysis of the instruments and procedures for international verification with the example of thirteen conventions.** Fischer, W. Forschungszentrum Juelich GmbH (Germany). Programmgruppe Technologiefolgenforschung. Jul 1991. 38p. Order Number DE92759274. Source: OSTI; NTIS (US Sales Only).

The results of the analysis are the following: Rules on the compliance examination by the conventions member states are laid down in the 13 conventions examined. However, they are generally imprecise and not wide ranging. The member states are indeed obliged to make declarations. The verification process is usually formulated in a very general manner: verification of national implementation reports is only explicitly envisaged in six conventions. Several explanations can be put forward for such weak verification provisions in environmental and resource protection conventions. One goes that international environmental policy either does not objectively affect any political field relevant to (inter)national security and power politics or else is not perceived as a security policy. Therefore there is at best little need for verification. Nevertheless, there are some strong arguments pointing to a gradual development in the interlinkage of security and the environment. Above all the discussion an a convention to reduce anthropogenic greenhouse gas emissions up to 60% seems to be moving in this direction. (orig./HSCH).

6788 (ORNL–6658/R9) **Environmental Regulatory Update Table, October 1991.** Houlberg, L.M.; Hawkins, G.T.; Salk, M.S. Oak Ridge National Lab., TN (United States). Nov 1991. 133p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC05-84OR21400. Order Number DE92004590. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 3643.

The Environmental Regulatory Update Table provides information on regulatory initiatives of interest to DOE operations and contractor staff with environmental management responsibilities. The table is updated each month with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

6789 (ORNL–6658/R10) **Environmental Regulatory Update Table, November 1991.** Houlberg, L.M.; Hawkins, G.T.; Salk, M.S. Oak Ridge National Lab., TN (United States). Dec 1991. 138p. 6790 (ORNL–6697) **Work plan, health and safety plan, and quality assurance project plan for hazardous waste removal at the CTF K-1654B underground collection tank.** Panter, M.S.; Burman, S.N.; Landguth, D.C.; Uziel, M.S. Oak Ridge National Lab., TN (United States). Oct 1991. 61p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. Order Number DE92004587. Source: OSTI; NTIS; GPO Dep.

The Central Training Facility (CTF), located on Bear Creek Road approximately two miles south of the K-25 Site, is utilized for training security personnel at Martin Marietta Energy Systems, Inc., Oak Ridge, Tennessee. At the request of the CTF staff, this plan has been developed for the removal of the waste contents in the facility's 500-gal septic tank and associated distribution box. The septic tank and distribution box were historically located beneath the K-1654B trailer and adjacent to the K-1654A Indoor Firing Range. Recently, however, the K-1654B trailer was removed to accommodate the objectives of this work plan as well as future construction activities planned at CTF. The purpose of this plan is to develop and assign responsibilities, establish personnel protection requirements and mandatory safety procedures, and provide for contingencies that may arise while operations are being conducted by ORNL/MAD at the CTF K-1654B underground collection tank site. This document addresses requirements of 29 CFR 1910.120, Final Rule, with respect to aspects of health and safety applicable to an underground collection tank waste removal.

6791 (PNL-SA–19675) **Environmental materials and interfaces: Proceedings.** Pacific Northwest Lab., Richland, WA (United States). Nov 1991. 53p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-9009424–: Workshop on molecular science research center: environmental materials and interfaces, Richland, WA (United States), 10-12 Sep 1990). Order Number DE92004703. Source: OSTI; NTIS; INIS; GPO Dep.

A workshop that explored materials and interfaces research needs relevant to national environmental concerns was conducted at Pacific Northwest Laboratory. The purposes of the workshop were to refine the scientific research directions being planned for the Materials and Interface Program in the Molecular Science Research Center (MSRC) and further define the research and user equipment to the included as part of the proposed Environmental and Molecular Science Laboratory (EMSL). Three plenary information sessions served to outline the background, objectives, and status of the MSRC and EMSL initiatives; selected specific areas with environmentally related materials; and the status of capabilities and facilities planned for the EMSL. Attention was directed to four areas where materials and interface science can have a significant impact on prevention and remediation of environmental problems: in situ detection and characterization of hazardous wastes (sensors), minimization of hazardous waste (separation membranes, ion exchange materials, catalysts), waste containment (encapsulation and barrier materials), and fundamental understanding of contaminant transport mechanisms. During all other sessions, the participants were divided into three working groups for detailed discussion and the preparation of a written report. The working groups focused on the areas of interface structure and chemistry, materials and interface stability, and materials synthesis. These recommendations and suggestions for needed research will be useful for other researchers in proposing projects and for suggesting collaborative work with MSRC researchers. 1 fig.

6792 (CONF-910571–, pp. 422-430) **Overview of Gas Research Institute environmental research programs.** Evans, J.M. (Gas Research Inst., Chicago, IL (United States)). North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The Gas Research Institute (GRI) is a private not-for-profit membership organization of natural gas pipelines, distribution companies and natural gas producers. GRI's purpose is to plan, to manage and to develop financing for a gas-related research and development (R and D) program on behalf of its members and their customers. GRI does not do any research itself. GRI's R and D program is designed to provide advanced technologies for natural gas supply, transport, storage, distribution and end-use applications in all markets. In addition, basic research is conducted for GRI in these areas to build a foundation for future technology breakthroughs. Work in the Environment and Safety Research Department includes sections interested in: supply related research, air quality research, end use equipment safety research, gas operations safety research, and gas operations environmental research. The Natural Gas Supply Program has research ongoing in such areas as: restoration of pipeline right-of-ways; cleaning up town gas manufacturing sites; the development of methanogenic bacteria for soil and groundwater cleanup; development of biological fluidized carbon units for rapid destruction of carbonaceous compounds; research on liquid redox sulfur recovery for sulfur removal from natural gas; research on produced water and production wastes generated by the natural gas industry; environmental effects of coalbed methane production; and subsurface effects of natural gas operations. The western coalbed methane and ground water programs are described.

6793 (EGG-M–91482) **Technology transfer from the space exploration initiative.** Buden, D. EG and G Idaho, Inc., Idaho Falls, ID (United States). 14 Jun 1991. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-920104–21: 9. symposium on space nuclear power systems, Albuquerque, NM (United States), 13-16 Jan 1992). Order Number DE92003317. Source: OSTI; NTIS; INIS; GPO Dep.

Space exploration has demonstrated that it stimulates the national economy by creating new and improved products, increased employment, and provides a stimulus to education. The exploration of the Moon and Mars under the Space Exploration Initiative has the potential of accelerating this stimulates to the economy. It is difficult to identify all of the concrete ways this will be accomplished. However, many areas can be identified. The space exploration building blocks of power, propulsion, spacecraft, robotics, rovers, mining and manufacturing, communications, navigation, habitats, life support and infrastructures are reviewed to identify possible technology areas. For example, better means for working in hazardous areas and handling hazardous waste are potential outcomes of this initiative. Methods to produce higher quality goods and improve America's competitiveness in manufacturing will undoubtedly evolve from the need to produce products that must last many years in the harsh environments of space and planetary surfaces. Some ideas for technology transfer are covered in this paper.

6794 (KAERI/RR–943/90) **Establishment of nuclear business management system.** Ahn, Jong Hwan (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Cho, Suk Hong; Oh, Du Sub; Kim, Sung Ki; Choi, Young Lok; Kim, Hwa Sup; Jun, Sang Jin; Yoon, Hyung Mo; Park, Jae Hong; Song, Tae Gil. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 170p. (In Korean). Order Number DE92615171. Source: OSTI; NTIS (US Sales Only); INIS.

For the formulation of the technology development strategies the nuclear core technology, environmental analysis has been performed in four aspects: ecological environment, energy economy, nuclear policy and R and D environment. After analyzing the environment and identifying the opportunities and threats from the environment, the strategies on individual and organizational level have been developed for both of the short-term and long-term periods. For the betterment of nuclear business management, the management information system, management by objective and the mechanism for the enhancement of negotiation power in the international agreement have been studied. (Author).

6795 (ORNL/PPA–90/1) **ORNL '90.** Anderson, T.; Barnes, D.; Jefferson, J. (eds.). Oak Ridge National Lab., TN (United States). [1990]. 62p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract AC05-84OR21400. Order Number DE92004801. Source: OSTI; NTIS; GPO Dep.

This overview of research conducted at ORNL in 1991 presents information on the subjects of biology, physics, and the environment. Specific topics include gene mutations in kidney disease, technology assessments in thermonuclear fusion, submarine hunting technology, ozone-safe refrigerants, optical data storage via surface enhanced raman spectroscopy, and waste mitigating microbes. 6797 (EGG-M–91483) **The roles and functions of a lunar base Nuclear Technology Center.** Buden, D. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Angelo, J.A. Jr. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 9p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-9110217–4: 42. International Aeronautical Federation Congress (IAEFC), Montreal (Canada), 7-11 Oct 1991). Order Number DE92003325. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the roles and functions of a special Nuclear Technology Center which is developed as an integral part of a permanent lunar base. Numerous contemporary studies clearly point out that nuclear energy technology will play a major role in any successful lunar/Mars initiative program and in the overall establishment of humanity's solar system civilization. The key role of nuclear energy in the providing power has been recognized. A Nuclear Technology Center developed as part of of a permanent lunar base can also help bring about many other nuclear technology applications, such as producing radioisotopes for self-illumination, food preservation, waste sterilization, and medical treatment; providing thermal energy for mining, materials processing and agricultural; and as a source of emergency habitat power. Designing such a center will involve the deployment, operation, servicing and waste product management and disposal of megawatt class reactor power plants. This challenge must be met with a minimum of direct human support at the facility. Furthermore, to support the timely, efficient integration of this Nuclear Technology Center in the evolving lunar base infrastructure, an analog of such a facility will be needed here on Earth. 12 refs., 4 figs., 1 tab.

6798 (KFK–4735) **Results of research and development activities in 1989 of the Institute for Neutron Physics and Reactor Technology.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik. Mar 1990. 34p. (In German). Order Number DE92750123. Source: OSTI; NTIS (US Sales Only); INIS.

The Institute for Neutron Physics and Reactor Technology treats research problems of nuclear engineering, mainly those that are related to the development of sodium-cooled fast breeder reactors and fusion reactor technology. The activities are in approximately equal parts of an experimental and theoretical nature. A great part of the research activities is performed in co-operation with other institutes and industrial groups in the framework of projects. For the Fast Breeder Reactor Project the Institute works on reactor physical design and safety problems by the core of large-scale fast breeder reactors. Questions concerning the consequences of accidents in light water reactors upon the environment and the population are treated as part of the Nuclear Safety Project. The Institute contributes to the Reprocessing Project with theoretical investigations on the physics of the fuel cycle and by developing control devices for a reprocessing plant. In the framework of the Fusion Project the Institute is concerned with neutron physical and technological questions of the breeder blanket. (orig.).

6799 (SKN–50) **Women, men and nuclear power.** Oskarson, M. National Board for Spent Nuclear Fuel, Stockholm (Sweden). Aug 1991. 62p. (In Swedish). Order Number DE92614084. Source: OSTI; NTIS (US Sales Only); INIS.

Men and women show different attitudes towards nuclear power and the reason for that has been studied. The results are presented in this report. (K.A.E.).

6800 (WHC-SA–1273) **Beneficial uses of radiation.** Fox, M.R. Westinghouse Hanford Co., Richland, WA (United States). Oct 1991. 13p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC06-87RL10930. Order Number DE92003024. Source: OSTI; NTIS; INIS; GPO Dep.

An overall decline in technical literacy within the American public has come at a time when technological advances are accelerating in the United States and around the world. This had led to a large communication gulf between the general public and the technologists. Nowhere is this more evident then with the topic of radiation. Regrettably, too few people know about sources of radiation, the pervasiveness, amounts, and variabilities, and do not have a true understanding of the environment in which we live. Nor do many people know that radiation has been used in beneficial ways for decades around the world. While the general public does not know of the scientific applications to which radiation has been deployed, it nevertheless had benefited tremendously from these efforts. Thanks to the well know properties of radiation, scientific ingenuity has found many uses of radiation in chemical and agricultural research, biomedical research, in the diagnoses and treatment of hundreds of types of diseases, in industrial applications, food irradiation, and many others. This paper provides a sample of the types of uses to which radiation has been used to help advance the betterment of humankind.

6801 (KURRI-TR–345, pp. 81-91) **Spallation symbiont and thorium breeding.** Furukawa, Kazuo (Tokai Univ., Hiratsuka, Kanagawa (Japan). Inst. of Research and Development). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Mar 1991. (In Japanese). (CONF-9008225–: Specialists' meeting on physics and engineering of fission and spallation; Specialists' meeting on physics and engineering of fission and spallation, Kumatori (Japan); Kumatori (Japan), 2 Aug 1990; 10 jan 1991; CONF-9101117–). In *Proceedings of the specialists' meeting on physics and engineering of fission and spallation, 1990.* 118p. Order Number DE92713857. Source: OSTI; NTIS (US Sales Only); INIS.

The medium term world energy and environment countermeasures for 2020-2070 are not yet clearly established. The forecast of energy situation hereafter, its problems and the measures for solution are considered. World trend is removing borders, and the north-south problems are increasing the importance. The rational and clear idea with the support of concrete technology is required. The demand of energy will increase enormously at the annual rate of 2.3%. The world energy situation was forecast considering the increase of population, and it will be 115 TW at the end of the next century. The present status, problems and the countermeasures in nuclear fission energy technology are explained. The countermeasures should be based on three principles, namely Th-U-233 cycle, the utilization of molten fluoride fuel medium and the separation of molten salt breeders and molten salt reactors. Accelerator molten salt breeders, small molten salt reactors, the nuclear fuel cycle and the annihilation process for radioactive wastes are reported. The perspective that the nuclear energy system, in which the reactor safety, the measures to wastes and others are improved by the spallation-fission symbiont using thorium molten salt as the working medium, can be constructed is shown. (K.I.).

6802 (CERCLA–005/1091) **Compendium of CERCLA ARARs fact sheets and directives.** Environmental Protection Agency, Washington, DC (United States). Office of Emergency and Remedial Response; USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Guidance. Oct 1991. 254p. Sponsored by U.S. DOE Environment Safety & Health; Environmental Protection Agency. Order Number DE92004878. Source: OSTI; NTIS; GPO Dep.

Section 121 (d) of the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) as amended by the Superfund Amendments and Reauthorization Act of 1986 (SARA), requires attainment of Federal and State applicable and relevant and appropriate requirements (ARARs). Subparts E, Section 300.400(g) "Identification of applicable or relevant and appropriate requirements" of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (55 CFR 8666, March 8, 1990) describes the process for attaining ARARs. The purpose of this compendium is to provide you with a complete and current source of "Quick Reference Fact Sheets" and Directives on applicable and relevant and appropriate requirements (ARARs). These fact sheets provide overviews of the ARARs for CERCLA cleanup actions. The Compendium of CERCLA ARARs consists of seven (7) chapters: lists of general fact sheets that provide introductory information on ARARs; Chapter 2 discusses air emissions from Superfund air strippers; Chapter 3 deals with Indian Tribal involvement in the Superfund program; Chapter 4 discusses soil lead cleanup levels at Superfund sites; Chapter 5 discusses the risk associated with Superfund cleanups; Chapter 6 contains four sections that discuss a variety of RCRA ARARs such as general guidance topics, land disposal restrictions, Superfund LDR guides, and toxicity characteristics; and finally, Chapter 7 contains a variety of ARAR fact sheets and directives on Wastewater, Safe Drinking Water Act and Groundwater.

6803 (DOE/OR/00033–T448) **R&D project selection models in the US Department of Energy.** Roessner, J.D. (Georgia Inst. of Tech., Atlanta, GA (USA). School of Social Sciences). Oak Ridge Associated Universities, Inc., TN (United States); Georgia Inst. of Tech., Atlanta, GA (United States). School of Social Sciences. 30 Sep 1981. 46p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract AC05-76OR00033. Order Number DE91014924. Source: OSTI; NTIS; GPO Dep.

This report examines the use of formal, quantitative R&D project selection models in the US Department of Energy (DOE). It details the characteristics and operation of major models currently used in DOE (at least on a trial basis); it discusses the functions that R&D project selection models perform within broader managerial and budgetary decision-making processes within DOE; and it compares the models used in DOE and the functions they performs with the situation in other federal agencies and in private industry. The objectives of the report are to inform DOE officials and others about the types of models used in DOE, identity some of the advantages and limitations of using quantitative project selection models to aid R&D budget decisionmaking, and provide insights into the interplay between the models and the organizational and political contexts in which they are used.

6804 (SAND–89-2075) **Export control and licensing at Sandia National Laboratories.** Sandia National Labs., Albuquerque, NM (United States). Aug 1990. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92005369. Source: OSTI; NTIS; GPO Dep.

Sandia is committed to a policy of adherence to all US export control laws and regulations. The export of technical data, software, or hardware will be accomplished in accordance with Federal agencies' export control regulations. Sandia employees at all levels are responsible to ensure that exports are accomplished in compliance with export control laws and regulations. This booklet explains these export control laws and regulations.

(Center for Regulatory Studies, Normal, IL (United States)); South, D.W. Argonne National Lab., IL (United States). [1991]. 13p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. (CONF-9104106–7: 53. annual American power conference, Chicago, IL (United States), 29 Apr - 1 may 1991). Order Number DE92004126. Source: OSTI; NTIS; GPO Dep.

The Clean Air Act Amendments (CAAA) of 1990 rely primarily on the use of market incentives to stimulate least-cost compliance choices by electric utilities. Because of the potential risks associated with selecting Clean Coal Technologies (CCTs) and the public-good nature of technology commercialization, electric utilities may be reluctant to adopt CCTs as part of their compliance strategies. This paper examines the nature of the risks and perceived impediments to adopting CCTs as a compliance option. It also discusses the incentives that regulatory policy makers could adopt to mitigate these barriers to CCT adoption. (VC)

6806 (CONF-910571–, pp. 3-22) **The clean coal initiative: An appropriate response to complex environmental issues.** Miller, C.L. (Dept. of Energy, Washington, DC (United States)). North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. [1991]. From 16. biennal low-rank fuels symposium; Billings, MT (United States); 20-23 May 1991. In *Proceedings of the sixteenth biennial low-rank fuels symposium.* 535p. Order Number DE92002606. Source: OSTI; NTIS; INIS.

The paper discusses the Department of Energy's Clean Coal Technology Program that can offer significant benefits when these technologies are used for power production, pollution control or the conversion of coal into other alternative energy products. The paper describes the status of the program, the 35 projects currently in the program, and the environmental role of clean coal technologies.

Sponsored by U.S. DOE Office of Administration and Human Resource Management. Order Number DE92003960. Source: OSTI; NTIS; GPO; GPO Dep.

The Petroleum Supply Monthly (PSM) is one of a family of three publications produced by the Petroleum Supply Division within the Energy Information Administration (EIA) reflecting different levels of data timeliness and completeness. The other two publications are the Weekly Petroleum Status Report (WPSR) and the Petroleum Supply Annual (PSA). Data presented in the PSM describe the supply and disposition of petroleum products in the United States and major US geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) District movements, and inventories by the primary suppliers of petroleum products in the United States (50 States and the District of Columbia). The reporting universe includes those petroleum sectors in Primary Supply. Included are: petroleum refiners, motor gasoline blenders, operators of natural gas processing plants and fractionators, inter-PAD transporters, importers, and major inventory holders of petroleum products and crude oil. When aggregated, the data reported by these sectors approximately represent the consumption of petroleum products in the United States. 14 figs.

This report highlights activities, events, and analyses of interest to public and private sector organizations associated with the natural gas industry. Volume and price data are presented each month for natural gas production, distribution, consumption, and interstate pipeline activities. Producer-related activities and underground storage data are also reported. From time to time, the natural gas monthly (NGM) features articles designed to assist readers in using and interpreting natural gas information. 7 figs., 33 tabs.

6812 (DOE/EIA–0202(91)) **Short-term energy outlook: Annual supplement 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 18 Nov 1991. 41p. Sponsored by U.S. DOE Energy Information Administration. Order Number DE92003655. Source: OSTI; NTIS; GPO; GPO Dep.

This report is published once a year as a complement to the Short-Term Energy Outlook (Outlook), quarterly projections. The purpose of the supplement is to review the accuracy of the forecasts published in the Outlook, make comparisons with other independent energy forecasts, and examine current energy topics that affect the forecasts. Included in the report is an evaluation of the accuracy of the short-term energy forecasts published in the last six issues of the Outlook, for 1990 through the first half of 1991 and a comparison of EIA's based or "mid" case energy projections as published in the second quarter 1991 Outlook with recent projections made by five other major forecasting groups. The section focuses on macroeconomic assumptions, primary energy demand, and primary energy supply showing the differences and similarities in the six forecasts. A chapter describing the comparison of Bayesian VAR and unrestricted VAR forecasting models of motor gasoline and distillate fuel prices and quantities is also included. 13 figs., 6 tabs.

6813 (DOE/EIA–0380(91/12)) **Petroleum marketing monthly, December 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 19 Dec 1991. 183p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. Order Number DE92005134. Source: OSTI; NTIS; GPO; GPO Dep.

This report the Petroleum Marketing Monthly (PMM) is designed to give information and statistical data about a variety of crude oils and refined petroleum products. The publication provides statistics on crude oil costs and refined petroleum products sales for use by industry, government, private sector analysts, educational institutions, and consumers. Data on crude oil include the domestic first purchase price, the f.o.b. and landed cost of imported crude oil, and refiners' acquisition cost of crude oil. Sales data for motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane are presented. 12 figs., 55 tabs.

6814 (DOE/EIA–0487(90)) **Petroleum marketing annual, 1990.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 24 Dec 1991. 430p. Sponsored by U.S. DOE Energy Information Administration. Order Number DE92005324. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

The Petroleum Marketing Annual contains statistical data on a variety of crude oils and refined petroleum products. The publication provides statistics on crude oil costs and refined petroleum products sales for use by industry, government, private sector analysts, educational institutions, and consumers. Data on crude oil include the domestic first purchase price, the free-on-board and landed cost of imported crude oil, and the refiners' acquisition cost of crude oil. Sales data for motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane are presented. (VC)

6815 (DOE/EIA–0520(91/11)) **International pertroleum statistics report, November 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 27 Nov 1991. 60p. Sponsored by U.S. DOE Energy Information Administration. Order Number DE92003717. Source: OSTI; NTIS; GPO; GPO Dep.

This report presents data on international oil production, consumption, imports, exports, and stocks. The report has four sections. Section 1 contains time series data on world oil production, and on oil consumption and stocks in the Organization for Economic Cooperation and Development (OECD). This section contains annual data beginning in 1980, and monthly data for the most recent two years. Section 2 presents an oil supply/consumption balance for the market economies (i.e. non-communist countries). This balance is presented in quarterly intervals for the most recent two years. Section 3 presents data on oil imports by OECD countries. This section contains annual data for the most recent year, quarterly data for the most recent two quarters, and monthly data for the most recent twelve months. Section 4 presents annual time series data on world oil production and oil stocks, consumption, and trade in OECD countries. World oil production and OECD consumption data are for the year 1970 through 1990; OECD stocks from 1973 through 1990; and OECD trade from 1982 through 1990. 41 tabs.

This section contains annual data for the most recent year, quarterly data for the most recent two quarters, and monthly data for the most recent twelve months. Section 4 presents annual time series data on world oil production and oil stocks, consumption, and trade in OECD countries. World oil production and OECD consumption data are for the years 1970 through 1990; OECD stocks from 1973 through 1990; and OECD trade from 1982 through 1990.

6817 (DOE/EIA-0538(91/92-9)) **Winter fuels report, week ending November 22, 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 27 Nov 1991. 70p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. Order Number DE92004689. Source: OSTI; NTIS; GPO Dep.

This Report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysts, and State local governments on the following topics: distillate fuel oil net production, imports and stocks for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks for PADD's 1, 2, and 3; natural gas supply and disposition and underground storage for the United States and consumption for all PADD's; residential and wholesale pricing data for propane and heating oil for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; crude oil and petroleum price comparisons for the United States and selected cities; and US total heating degree-days by city. 37 figs., 13 tabs.

6818 (DOE/EIA-0538(91/92-10)) **Winter fuels report, week ending November 29, 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 5 Dec 1991. 70p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. Order Number DE92003959. Source: OSTI; NTIS; GPO Dep.

The Winter Fuels Report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysts, and State and local governments on the following topics: distillate fuel oil net production, imports and stocks for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks for PADD's I, II, and III; natural gas supply and disposition and underground storage for the United States and consumption for all PADD's; residential and wholesale pricing data for propane and heating oil for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; crude oil and petroleum price comparisons for the United States and selected cities; and US total heating degree-days by city. 37 figs.

6819 (DOE/EIA-0538(91/92-11)) **Winter fuels report, week ending December 6, 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 12 Dec 1991. 70p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. Order Number DE92004725. Source: OSTI; NTIS; GPO; GPO Dep.

This report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysts, and State and local governments on the following topics: distillate fuel oil net production, imports and stocks for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks for PADD's 1, 2, and 3; natural gas supply and disposition and underground storage for the United States and consumption for all PADD's; residential and wholesale pricing data for propane and heating oil for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; crude oil and petroleum price comparisons for the United States and selected cities; and US total heating degree-days by city.

6820 (DOE/EIA-0538(91/92-12)) **Winter fuels report, week ending December 13, 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 19 Dec 1991. 70p. Sponsored by U.S. DOE Energy Information Administration. Order Number DE92004812. Source: OSTI; NTIS; GPO; GPO Dep.

This Report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysts, and State and local governments on the following topics: distillate fuel oil net production, imports and stocks for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks for PADD's 1, 2, and 3; natural gas supply and disposition and underground storage for the United States and consumption for all PADD's; residential and wholesale pricing data for propane and heating oil for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; crude oil and petroleum price comparisons for the United States and selected cities; and US total heating degree-days by city.

6821 (DOE/EIA-0543(91/3Q)) **US energy industry financial developments, 1991 third quarter.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 11 Dec 1991. 15p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. Order Number DE92004795. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

Net income for the 218 energy companies included in this report was 15 percent lower in the third quarter of 1991 than in the third quarter of 1990. Declining income from oil and natural gas production, chemical operations, and coal operations resulted in a 33-percent fall in income for fossil fuel companies. The other category of energy companies included in this report, rate-regulated utilities, recorded essentially no change in income.

6822 (ORNL-6683) **Navy mobility fuels forecasting system report: World petroleum trade forecasts for the year 2000.** Das, S. Oak Ridge National Lab., TN (United States). Dec 1991. 45p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. Order Number DE92004085. Source: OSTI; NTIS; GPO Dep.

The Middle East will continue to play the dominant role of a petroleum supplier in the world oil market in the year 2000, according to business-as-usual forecasts published by the US Department of Energy. However, interesting trade patterns will emerge as a result of the democratization in the Soviet Union and Eastern Europe. US petroleum imports will increase from 46% in 1989 to 49% in 2000. A significantly higher level of US petroleum imports (principally products) will be coming from Japan, the Soviet Union, and Eastern Europe. Several regions, the Far East, Japan, Latin American, and Africa will import more petroleum. Much uncertainty remains about of the level future Soviet crude oil production. USSR net petroleum exports will decrease; however, the United States and Canada will receive some of their imports from the Soviet Union due to changes in the world trade patterns. The Soviet Union can avoid becoming a net petroleum importer as long as it (1) maintains enough crude oil production to meet its own consumption and (2) maintains its existing refining capacities. Eastern Europe will import approximately 50% of its crude oil from the Middle East.

6823 (DOE/EIA-0226(91/11)) **Electric power monthly, November 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. 18 Nov 1991. 199p. Sponsored by U.S. DOE Energy Information Administration. Order Number DE92003715. Source: OSTI; NTIS; GPO; GPO Dep.

This publication provides monthly statistics at the national, Census division, and State levels for net generation, fuel consumption, fuel stocks, quantity and quality of fuel, cost of fuel, electricity sales, revenue, and average revenue per kilowatthour of electricity sold. Data on net generation, fuel consumption, fuel stocks, quantity and cost of fuel are also displayed at the North American Electric Reliability Council (NERC) region level. Additionally, statistics at the company and plant level are published in the EPM on capability of new plants, net generation, fuel consumption, fuel stocks, quantity and quality of fuel, and cost of fuel. 4 figs., 63 tabs.

6824 (ORNL/CON-340) **The effects of utility DSM programs on electricity costs and prices.** Hirst, E. Oak Ridge National Lab., TN (United States). Nov 1991. 51p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE92004595. Source: OSTI; NTIS; GPO Dep.

More and more US utilities are running more and larger demand-side management (DSM) programs. Assessing the cost-effectiveness of these programs raises difficult questions for utilities and their regulators. Should these programs aim to minimize the total cost of providing electric-energy services or should they minimize the price of electricity? This study offers quantitative estimates on the tradeoffs between total costs and electricity prices. This study uses a dynamic model to assess the effects of energy-efficiency programs on utility revenues, total resource costs, electricity prices, and electricity consumption for the period 1990 to 2010. These DSM programs are assessed under alternative scenarios. In these cases, fossil-fuel prices, load growth, the amount of excess capacity the utility has in 1990, planned retirements of power plants, the financial treatment of DSM programs, and the costs of energy- efficient programs vary. These analyses are conducted for three utilities: a "base" that is typical of US utilities; a "surplus" utility that has excess capacity, few planned retirements, and slow growth in fossil-fuel prices and incomes; and a "deficit" utility that has little excess capacity, many planned retirements, and rapid growth in fossil-fuel prices and incomes. 28 refs.

6825 (IEE-SR-223) **Introduction of renewable energy to Japan and feasibility study on reduction of environmental load.** Institute of Energy Economics, Tokyo (Japan). Jul 1991. 159p. (In Japanese). Order Number DE92749185. Source: OSTI; NTIS (US Sales Only).

Possibility of substitution of renewable energy (RE) such as solar, biomass, hydraulic power, ocean, wind and geothermy is investigated to preserve the global environment and solve the energy source depletion problem. RE availability in Japan is 24×10^{14}kcal?y including 61×10^{10}kWh?y of electric power and 10×10^{14}kcal?y of heat quantity (electric power is multiplied by 2.7 for conversion to calorie, with thermal power generation efficiency as 37%). For the time being, the target for 2030 is 9×10^{14}kcal?y in total which is equivalent to petroleum substitution of 97 million kl and CO_2 reduction of 270 million tons. When fossil fuels are subsituted for RE, costs of CO_2 recovery?fixation calculated from CO_2 discharge amount, carbon tax to be paid, environmental damage are added to the fossil fuel cost as a social cost. With this, a wide use of RE is evaluated as a merit. As for the target for 2030 set for the present, cost of CO_2 fixation, carbon tax and environmental damage are annually 1.8 trillion yen, 0.72 - 6.7 trillion yen and 3.9 - 6.7 trillion yen, respectively. 7 figs., 19 tabs.

6826 (CONF-9102112-Absts., pp. 1-81) **MHD Integrated Topping Cycle (ITC) project.** Bauer, J.M. (TRW Space and Technology Group, Redondo Beach, CA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). [1991]. DOE Contract AC22-87PC90274. From Magnetohydrodynamic (MHD) contractors review meeting; Pittsburgh, PA (United States); 19-21 Feb 1991. In *MHD contractor's review meeting. Abstracts.* 314p. Order Number DE91011295. Source: OSTI; NTIS.

The objectives of the Integrated Topping Cycle project are to design, construct, and deliver all prototypical hardware necessary to conduct long duration integrated MHD topping cycle proof-of-concept tests at the Component Development and Integration Facility (CDIF) in Butte, Montana. The results of the long duration tests will augment the existing engineering data base on MHD power train reliability, maintainability, durability, and performance, and will serve as a basis for scaling up the early commercial scale power plant retrofit. The components of the MHD power train to be designed, fabricated, and tested include the following: a slagging coal combustion subsystem with a rated capacity of 50 MW thermal input, capable of operation with eastern (Illinois #6) or western (Montana Rosebud) coal; a channel subsystem consisting of a segmented supersonic nozzle, channel (with current controls), and diffuser, capable of power output of 1.5 Mw(e); and a current consolidation subsystem to interface the channel with the existing facility inverter. The paper discusses the work completed on the following: systems engineering and data analysis; combustion subsystem design; channel subsystem design; current consolidation subsystem design; and CDIF testing.

The Component Development and Integration Facility (CDIF) is an engineering scale, development test facility for magnetohydrodynamic (MHD) topping cycle components operated for the US Department of Energy by MSE, Inc. The major objective of the CDIF is to obtain MHD test results that will provide the design basis for larger scale MHD components, which is in support of DOE's commitment to the MHD development and proof-of-concept program. Included is support for the National MHD Environmental Program that provides research on environmental issues specific to MHD, evaluation of environmental test data from the CDIF and the Coal-Fired Flow Facility (CFFF), support for the development of an MHD technical data base, and ambient air quality monitoring at the CDIF. The paper discusses work completed on the following: facility ES and H compliance issues; facility support; testing and evaluation; test hardware support; and national MHD environmental program.

The emphasis at UTSI has been to provide technology needed for scaleup of heat recovery, seed recovery components, including corrosion and erosion, slagging and fouling of heat transfer surfaces, seed recovery, control of priority pollutants and particulate emissions, heat transfer, system integration, and waste management and environmental concerns. The paper summarized three performance tests with bituminous coal, then discusses results from component development and test facility modifications under the following headings: automated ash/seed handling system; high pressure sootblower system; high temperature air heater; convection enhancement; superheater test module tube corrosion; ash deposition; baghouse; electrostatic precipitator; pollution control; and gas phase chloride measurement.

6829 (CONF-9102112–Absts., pp. 231-250) **MHD heat recovery and seed recovery system development.** McIlroy, R.A. USDOE Pittsburgh Energy Technology Center, PA (United States). [1991]. Order Number DE91011295. Source: OSTI; NTIS.

The objective is to develop a technology base for the design of Heat Recovery Seed Recovery (HRSR) systems for central station MHD Electric Power Plants. The commercial plant designers reviewed a summary of the operating conditions within the various components and the test data that was being gathered. They expressed concern about the lack of data on materials compatibility in the higher temperature zones of the radiant furnace and in the diffuser. The author started the task of gathering steady state data that the designers, B&W's and those of other steam generator suppliers, could use to develop scale up methods and procedures. He is attempting to make available files of steady state data for: heat transfer to the diffuser, the radiant furnace and the furnace downstream of the secondary combustor; heat transfer to the superheater test module, SHTM, test sections and cooling sections and the air heater; gaseous emissions data and conditions affecting emissions such as primary and secondary stoichiometries, temperatures and temperature decay rates, potassium to sulfur ratios, etc.; ESP performance and data on conditions affecting the performance; BH performance and conditions affecting the performance; dense phase feed system and flow measurement; operating conditions of corrosion and deposition probes; and performance of sootblowers and SHTM, including metal temperatures and sootblower operating conditions.

USDOE Pittsburgh Energy Technology Center, PA (United States). [1991]. DOE Contract AC02-80ET15601. From Magnetohydrodynamic (MHD) contractors review meeting; Pittsburgh, PA (United States); 19-21 Feb 1991. In *MHD contractor's review meeting. Abstracts.* 314p. Order Number DE91011295. Source: OSTI; NTIS.

The objective of the Diagnostic Instrumentation and Analysis Laboratory's DOE contract is to develop advanced optical and laser-based techniques and computer-controlled instrumentation systems for characterization of MHD and HRSR gas streams; and provide field measurements for direct diagnostic support of MHD engineering development test facilities. The paper discusses operation and performance of the instruments developed to measure furnace flow profiles, surface temepratures, gas temperature, potassium atom number density, gas point temperature, and particle size. The multi-purpose imaging system, the Faraday rotation system, the differential absorption laser spectrometer, and the laser optogalvanic spectrometer are described.

The objective of this work is to address technical issues related to both the MHD topping and steam bottoming cycles and to their integration. Design information will be obtained through modeling and experimentation. This information, together with the results of the long duration testing at DOE's Coal Fired Flow Facility (CFFF) and Component Development and Integration Facility (CDIF), can be used to reliably design the first-generation MHD retrofit plant. Work during the reporting period focused on the following two major tasks: (1) computer modeling of the second stage of the TRW combustor and (2) evaluation of materials for the intermediate temperature air heater, the MHD channel, and the MHD combustor. Accomplishments in these areas are briefly described in the following sections.

6832 (CONF-9102112–Absts., pp. 297-305) **TRW Econoseed process for MHD seed recovery and regeneration.** McClanathan, L.C. (TRW Applied Technology Div., Redondo Beach, CA (United States)). Source: OSTI; NTIS.

The Phase 2 Proof-of-Concept (POC) test program is aimed at the development of a process that will economically recover and regenerate potassium seed used in the combustion of high sulfur coals in MHD systems. The program objectives are to: (1) design, construct and operate a POC test plant to demonstrate the process technology using actual high sulfur seed (Illinois No. 6) from UTSI, (2) to produce tonnage quantities of recycled seed for testing at the CDIF facility, (3) to design, construct and operate a separate, smaller scale POC unit to demonstrate the production of feed material calcium formate from lime and CO gas based on proof-of-principle experiments performed by Union Carbide in the early 1950's, and (4) to collect operating and equipment data to update the desing and process economics for a seed regeneration system that will support a 300 MW(t) MHD system. Work completed to date is described.

6833 (CONF-9106303–, pp. 173-176) **Corrosion and arc erosion in MHD channels.** Rosa, R.J. (Montana State Univ., Bozeman (United States)); Pollina, R.J. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88928. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective of this work is to study the corrosion and arc erosion of MHD materials in a cooperative effort with the MHD topping cycle program of DOE. Materials tested in the Avco Research Laboratory/Textron facility, or materials which have significant MHD importance, will be analyzed to document their physical deterioration. Conclusions shall be drawn about their wear mechanisms and lifetime in the MHD environment with respect to the following issues: sulfur corrosion, electrochemical corrosion, and arc erosion. The impact of any materials or slag conditions on the level of power output and on the level of leakage current in the MHD channel will also be noted, where appropriate. Last year a method for determining leakage current was developed and applied to a large quantity of test data from the DOE MHD facility in Butte, MT. This data reduction task continues as test results become available. The primary effort this year has been to understand the mechanisms responsible for leakage and how they affect electrode lifetime. To this end, by comparing data from many runs, the authors have sought correlations between the leakage values and various duct operation parameters. The resulting correlations have suggested three mechanisms plus a possible fourth which may together be responsible for most of the observed leakage. Results and mechanisms are summarized.

6834 (DOE/PC/79679–T1) **An MHD heat source based on intermetallic reactions: Final report, September 15, 1987–September 30, 1990.** Sadjian, H. (General Sciences, Inc., Souderton, PA (United States)); Zavitsanos, P.; Marston, C.H. General Sciences, Inc., Souderton, PA (United States). 6 May 1991. 72p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79679. Order Number DE92000036. Source: OSTI; NTIS; GPO Dep.

The main objective of this program was the development of an MHD heat source of potential use in Space - Based Multi

Megawatt, MHD Power Systems. The approach is based on extension of high temperature chemical/ion release technology developed by the General Sciences, Incorporated (GSI) team and successfully applied in other Space Applications. Solid state reactions have been identified which can deliver energy densities and electrons in excess of those from high energy explosives as well as other conventional fuels. The use of intermetallic reactions can be used to generate hot hydrogen plasma from the reaction, to create a high level of seedant ionization, can be packaged as a cartridge type fuels for discrete pulses. The estimated weight for energizing a (100 MW - 1000 sec) Pulsed MHD Power System can range from 12 to 25 × 10^3 kg depending on reaction system and strength of the magnetic field. The program consisted of two major tasks with eight subtasks designed to systematically evaluate these concepts in order to reduce fuel weight requirements. Laboratory measurements on energy release, reaction product identification and levels of ionization were conducted in the first task to screen candidate fuels. The second task addressed the development of a reaction chamber in which conductivity, temperature and pressure were measured. Instrumentation was developed to measure these parameters under high temperature pulsed conditions in addition to computer programs to reduce the raw data. Measurements were conducted at GSI laboratories for fuel weights of up to 120 grams and at the Franklin Research Center* for fuel weights up to 1 kilogram. The results indicate that fuel weight can be scaled using modular packaging. Estimates are presented for fuel weight requirements. 15 refs.

6835 (DOE/PC/88652–T7) **Development and application of diagnostic instrumentation for measurement of electron density and conductivity: Final technical progress report.** Bauman, L.E. Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab. May 1990. 54p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-88PC88652. Order Number DE92002134. Source: OSTI; NTIS; GPO Dep.

The purpose of this contract was to assemble and demonstrate in the laboratory a Faraday rotation system for measurement of electron density and conductivity, with the intent to produce a system suitable for diagnostic support of the development of pulsed, space-based magnetohydrodynamic (MHD) power systems. Two system configurations were tested: (1) a rotating polarizer and (2) a beam splitting polarizer. Due to the short path length plasma produced in the laboratory flame, the long wavelength 496 μm methyl fluoride laser line was used and only the more sensitive rotating polarizer configuration was used for the demonstration experiments. Electron number densities from 2 × 10^{19} to 9 × 10^{19} were measured with good agreement to statistical equilibrium (Saha) calculations using emission absorption-measured flame temperatures and neutral seed atom number seed atom nuclear densities. The electron collision frequencies were measured by transmission measurements. Combining these two measurements gave measured electron conductivities of between 4 and 12 mohs/m. These results compared reasonably well with those found with an electron collision frequency model combined with chemical equilibrium calculations and the emission absorption measurements. Ellipticity measurements of electron collision frequency were not possible due to the short path length of the laboratory plasma. 46 refs., 25 figs., 9 tabs.

6836 (WHC-SA–1257-Rev.1) **Design and equipment installation for Radioisotope Power Systems Facility metallic cleaning room 162 subsystem 6130: Revision 1.** Adkins, H.E.; Williams, J.A. Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 6p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-920104–17-Rev.1: 9. symposium on space nuclear power systems, Albuquerque, NM (United States), 13-16 Jan 1992). Order Number DE92002652. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A fully equipped cleaning and packaging line for cleaning nonradioactive metallic components and tools required in the assembly/disassembly of Radioisotope Thermalelectric Generators (RTG) is being designed and installed in room 162 of the Fuels and Materials Examination Facility (FMEF), which contains the Radioisotope Power Systems Facility (RPSF). The FMEF is a modern nuclear facility meeting current safety standards. Process equipment in cleaning room 162 includes a glovebox cleaning station with an airlock, an assembly and packaging workstation, and a downflow spray cleaning station. The glovebox cleaning station is used for controlled atmosphere cleaning of metallic components such as tools and canisters. The assembly and packaging workstation is used for tool and component cleanliness examination, inspection, assembly, and packaging. The downflow spray cleaning table is used for final particulate cleaning and inspection before packaging. The metallic cleaning line is planned for operation in FY as part of the RPSF. 3 figs.

3005 Fuel Cells

6837 (DOE/MC/24164–3012) **Characterization and development of a new ceramic electrolyte for fuel cell applications: Final report.** Solid State Fuel Cells, Columbia, MD (United States). Jun 1991. 73p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC21-87MC24164. Order Number DE91002092. Source: OSTI; NTIS; GPO Dep.

This work consisted of research directed toward characterization and development of new solid electrolyte materials that are potentially superior to other solid electrolyte materials currently under development (such as yttria-stabilized zirconia). The solid electrolyte technology described herein is based on new ceramic materials generally described as Bismuth Oxide doped with Niobium or Yyyrium oxides that were exclusively licensed to Solid-State Fuel Cells, Inc. by CeramPhysics, Inc. The technology is also based on further material, cell and stack technology concepts and manufacturing methods that were earlier reduced to practice by Solid- State Fuel Cells, Inc., and which are therefore proprietary to the Company. In this report a presentation of the overall program background is provided in Section 2.0. This includes a technical discussion of the technology in the context of the current state of the art. The task work description for the applicable portion of Phase 1 is presented in Section 3.0. Specifically, Phase 1-A comprises the following elements: Electrolyte materials development; testing of electrolyte stability under a reducing environment; development of cell electrodes; test fixtures design and facility erection; and preliminary coupon cell tests. 24 figs., 6 tabs.

6838 (ETDE-mf–2750133) **Development of high temperature fuel cells - project preparation phase. Final report.** Drenckhahn, W.; Mund, K. Siemens AG Unternehmensbereich KWU, Erlangen (Germany); Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Apr 1991 91p. (In German). Contract BMFT 0328984A. Order Number DE92750133. Source: OSTI; NTIS (US Sales Only).

The basis for the decision whether or not to develop the high temperature fuel cell on a longterm basis, was worked out during the preparation phase. In order to accomplish this task, the molten carbonate fuel cell (MCFC) as well as the solid oxide fuel cell (SOFC, mainly sponsored by the CEC) have been investigated, and power plant studies for both fuel cell technologies were carried out. The MCFC development was performed in cooperation with ISE of the Fraunhofer Society and TH Darmstadt, the system engineering was done in collaboration with Linde AG. The MCFC laboratory cell yielded good power data, but the system studies showed an efficiency advantage of about 10 percent points of the SOFC over the MCFC technology. For this reason, Siemens decided to put more emphasis on the development of the SOFC and discontinue activities regarding the MCFC. (orig.).

Brookhaven National Lab., Upton, NY (United States). Sep 1991. 115p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-76CH00016. Order Number DE92005375. Source: OSTI; NTIS; GPO Dep.

A control strategy to reduce peak electric demand in small buildings was tested and evaluated. A test chamber designed to simulate the thermal response of a house was used in the experiments. The control strategy involved precooling the house before the onset of the peak and then controlling on humidity rather than temperature during the peak. A variant of the strategy substituted a low setpoint temperature and a limit on fractional on-time during the peak. Using this variant, the maximum on-peak demand was reduced by 35% while maintaining acceptable thermal comfort. Overall energy consumption was increased by 12%; means for eliminating this excess consumption are suggested for further evaluation.

6840 (CONF-911256–4) **Overview of CFC replacement issues for household refrigeration.** Vineyard, E.A. (Oak Ridge National Lab., TN (United States)); Roke, L.; Hallett, F. Oak Ridge National Lab., TN (United States). [1991]. 7p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From International chlorofluorocarbon (CFC) and halon alternatives conference; Baltimore, MD (United States); 3-5 Dec 1991. Order Number DE92004477. Source: OSTI; NTIS; GPO Dep.

In 1974, the famous ozone depletion theory of Rowland and Molina claimed that chlorofluorocarbons (CFCs) diffuse into the stratosphere where they are broken down by photolysis to release chlorine atoms that catalytically destroy ozone. Although the understanding of the science is still imperfect, there is little doubt that CFCs play a major role in the Antarctic ozone hole phenomenon and the decline in ozone observed in the rest of the world. Another issue that has become increasingly important is the potential of CFCs to change the earth's temperature and to modify the climate. While the main impact in global warming is made by increased concentrations of carbon dioxide, CFCs and other trace gases also contribute to this effect. In an effort to respond to the global environmental threat, a CFC protocol was adopted during a diplomatic conference in Montreal. This document, known as the Montreal Protocol, was ratified in 1988 and put into effect on January 1, 1989. In accordance with Article 6 of the Montreal Protocol, the countries that signed the agreement shall periodically assess the control measures provided for in the Protocol. As part of that assessment process, household refrigeration was investigated to determine the status of CFC-12 replacements. The conclusion was that much progress has been made towards finding a suitable replacement. Compressors designed for HFC-134a have efficiencies comparable to those for CFC-12 and acceptable reliability tests have been obtained with ester lubricants. In addition, other replacements such as R-152a and refrigerant mixtures exist, but will require more study. Cycle options, such as the Stirling cycle, may be viable, but are further out in the future. The impact of new refrigerants is expected to result in elimination of CFC-12 consumption in developed countries by 1997 and in developing countries by 2005.

6841 (CONF-920108–2) **Benchmark performance analysis of an ECM-modulated air-to-air heat pump with a reciprocating compressor.** Rice, C.K. Oak Ridge National Lab., TN (United States). Jan 1992. 40p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From International air conditioning, heating, refrigerating exposition; Anaheim, CA (United States); 25-29 Jan 1992. Order Number DE92004478. Source: OSTI; NTIS; GPO Dep.

A benchmark analysis was conducted to predict the maximum steady- state performance potential of a near-term modulating residential- size heat pump. Continuously variable-speed, permanent-magnet electronically commutated motors (ECMs) were assumed to modulate the compressor and the indoor and outdoor fans in conjunction with existing modulating reciprocating compressor technology. A modulating heat pump design tool was used to optimize this ECM benchmark heat pump, using speed ranges and total heat exchanger sizes per-unit-capacity equivalent to that used by the highest SEER-rated variable-speed unit presently on the market (SEER = 16.4). Parametric steady-state performance optimization was conducted at a nominal design cooling ambient of 95°F (35°C) and at three off-design ambients of 82°F (27.8°C) cooling and 47°F and 17°F (8.3°C and −8.3°C) heating. In comparison to the reference commercially available residential unit, the analysis for the ECM benchmark predicted steady-state heating COPs about 35% higher and a cooling EER almost 25% higher at the nominal design cooling condition. The cooling EER at 82°F (27. 8°C) was 13% higher than that of the reference unit when a comparable sensible heat ratio of 0.71 was maintained, while an EER gain of 24% at the 82°F (27.8°C) rating point was predicted when the sensible heat ratio was relaxed to 0.83. 28 refs., 14 figs., 7 tabs.

6842 (DOE/CH/10093–120) **Refrigeration systems program summary.** Energetics, Inc., Columbia, MD (United States). Dec 1991. 20p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE91015024. Source: OSTI; NTIS; GPO Dep.

In addition to saving energy, deploying advanced refrigeration technologies can substantially benefit the environment. Chlorofluorocarbons (CFCs) have been identified as a major cause of potential global climate change and about 20% of the CFCs consumed by the United States are due to refrigeration systems. As the international Montreal Protocol will phase out CFC compounds no later than 2000, there is tremendous need to develop safe non-CFC refrigerants and working fluids, alternative refrigeration cycles, an non-CFC insulations for appliances. The US Department of Energy (DOE) established the Refrigeration System Program in 1977 to lead a national effort to accelerate the deployment of cost-effective and energy-efficient air-conditioning and refrigeration technologies. The program primarily conducts research and development on advanced refrigeration technologies. The program-managed by the Office of Building Technologies, which reports to DOE's Assistant Secretary for Conversation and Renewable Energy-encompasses several key activities such as investigating alternative refrigerants and refrigeration cycles, developing advanced technologies for future air-conditioning and refrigeration equipment designs, and developing advanced appliance insulations.

6843 (ORNL/TM–11703) **A review of vacuum insulation research and development in the Building Materials Group of the Oak Ridge National Laboratory.** Kollie, T.G.; McElroy, D.L.; Fine, H.A.; Childs, K.W.; Graves, R.S.; Weaver, F.J. Oak Ridge National Lab., TN (United States). Sep 1991. 101p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE92004908. Source: OSTI; NTIS; GPO Dep.

This report is a summary of the development work on flat-vacuum insulation performed by the Building Materials Group (BMG) in the Metals and Ceramics Division of the Oak Ridge National Laboratory (ORNL) during the last two years. A historical review of the technology of vacuum insulation is presented, and the role that ORNL played in this development is documented. The ORNL work in vacuum insulation has been concentrated in Powder-filled Evacuated Panels (PEPs) that have a thermal resistivity over 2.5 times that of insulating foams and seven times that of many batt-type insulations, such as fiberglass. Experimental results of substituting PEPs for chlorofluorocarbon (CFC) foal insulation in Igloo Corporation ice coolers are summarized. This work demonstrated that one-dimensional (1D) heat flow models overestimated the increase in thermal insulation of a foam/PEP-composite insulation, but three-dimensional (3D) models provided by a finite-difference, heat-transfer code (HEATING-7) accurately predicted the resistance of the composites. Edges and corners of the ice coolers were shown to cause the errors in the 1D models as well as shunting of the heat through the foam and around the PEPs. The area of coverage of a PEP in a foam/PEP composite is established as an important parameter in maximizing the resistance of such composites. 50 refs., 27 figs,. 22 tabs.

6844 (PNL–7889) **Measured electric hot water standby and demand loads from Pacific Northwest homes: End-Use Load and Consumer Assessment Program.** Pratt, R.G.; Ross, B.A. Pacific Northwest Lab., Richland, WA (United States). Nov 1991. 116p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC06-76RL01830. Order Number DE92004449. Source: OSTI; NTIS; GPO Dep.

The Bonneville Power Administration began the End-Use Load and Consumer Assessment Program (ELCAP) in 1983 to obtain metered hourly end-use consumption data for a large sample of new and existing residential and commercial buildings in the Pacific Northwest. Loads and load shapes from the first 3 years of data fro each of several ELCAP residential studies representing various segments of the housing population have been summarized by Pratt et al. The analysis reported here uses the ELCAP data to investigate in much greater detail the relationship of key occupant and tank characteristics to the consumption of electricity for water heating. The hourly data collected provides opportunities to understand electricity consumption for heating water and to examine assumptions about water heating that are critical to load forecasting and conservation resource assessments. Specific objectives of this analysis are to: (A) determine the current baseline for standby heat losses by determining the standby heat loss of each hot water tank in the sample, (B) examine key assumptions affecting standby heat losses such as hot water temperatures and tank sizes and locations, (C) estimate, where possible, impacts on standby heat losses by conservation measures such as insulating tank wraps, pipe wraps, anticonvection valves or traps, and insulating bottom boards, (D) estimate the EF-factors used by the federal efficiency standards and the nominal R-values of the tanks in the sample, (E) develop estimates of demand for hot water for each home in the sample by subtracting the standby load from the total hot water load, (F) examine the relationship between the ages and number of occupants and the hot water demand, (G) place the standby and demand components of water heating electricity consumption in perspective with the total hot water load and load shape.

6845 (RAL-91-054) **Dynamic thermal transmission.** Irving, A.D. Rutherford Appleton Lab., Chilton (United Kingdom). Aug 1991. 41p. Order Number DE92750020. Source: OSTI; NTIS (US Sales Only).

The thermal transmittance of a building component may be defined as the amount of heat flux which flows when steady state conditions are maintained across the component. The U-value of the component is a steady state quantity whilst the thermal transmission matrix represents the dynamic response of the component. This work defines the thermal transmission matrix elements in terms of Volterra kernel, or impulse response, functions. The Volterra kernel functions are considered to represent dynamic thermal transmission and the area under each response function may be considered to be equivalent to the steady state value. Linear vector and non-linear univariate thermal systems are considered and discussed with reference to their electrical analogues. The Volterra kernel values are extracted via the time series statistical central moments estimates from the data. (author).

6846 (ANL/CP–74752) **Transportation in the twenty-first century.** Coffey, H.T. Argonne National Lab., IL (United States). [1991]. 13p. Sponsored by U.S. Department of Transportation. DOE Contract W-31109-ENG-38. (CONF-9110278–1: Clean air act amendments: an economic opportunity for Illinois and the Midwest, Chicago, IL (United States), 11 Oct 1991). Order Number DE92003521. Source: OSTI; NTIS; GPO Dep.

New energy-efficient and environmentally-sound magnetically levitated (maglev) transportation systems are being developed that have the potential to supplement and extend the intercity portion of our transportation system, and to alleviate part of the commuter congestion on our highways. Prototype passenger-carrying maglev vehicles are now operating in Japan and Germany. The capabilities of these systems, described in science fiction over two decades ago, are no longer speculative. They will be capable of transporting 100–150 passengers per vehicles or 1500 passengers per train at speeds of 250–350 mph. While performing many of the same functions of short-haul aircraft, these electrically powered vehicles: do not emit pollutants along the route; use about 1/3 the energy per passenger mile of modern aircraft; do not contact the guideway and therefore minimize maintenance; are silent except for the noise of air passing over the body. This paper assesses current maglev technology. 7 refs., 5 figs.

6847 (CONF-920153–2) **Variance reduction applied to urban network traffic simulation.** Rathi, A.K. (Oak Ridge National Lab., TN (United States)); Venigalla, M.M. Oak Ridge National Lab., TN (United States). Sep 1991. 31p. Sponsored by U.S. Department of Transportation. DOE Contract AC05-84OR21400. From 71. annual meeting of the Transportation Research Board; Washington, DC (United States); 14 Jan 1992. Order Number DE92004233. Source: OSTI; NTIS; GPO Dep.

This paper describes and illustrates the effectiveness of variance reduction techniques that user can apply to improve the efficiency and reliability of simulation experiments with the TRAF-NETSIM simulation model. The two variance reduction techniques, antithetic variates and common random numbers, reduce the variance of simulation output by replacing the original sampling procedure by a new procedure that yields the same parameter estimate but with a smaller variance. Thus, the user can obtain greater amount of statistical accuracy for the same number of simulation runs. A recent modification in the stochastic sampling process has made the TRAF-NETSIM model amenable to these variance reduction techniques, and allows the user to apply these techniques with minimal additional effort. The effectiveness of these techniques is evaluated through an analysis of simulation output from two TRAF-NETSIM data sets. The estimated values and variances are computed for some representative measures of effectiveness after 10, 20, and 30 replications. The results of this study indicate that both techniques are quite effective in reducing variance of the model output. By using the antithetic variates sampling procedure, the variance of simulation parameter estimates can be reduced by as much as 88 percent. In all cases studied, better statistical precision is obtained by making two-thirds fewer simulations than under conventional multiple replications-based experimentation. The common random number strategy also reduces the variance but is not as effective as the antithetic variates technique in this case study.

6848 (DOE/CE/15348–T8) **Herbert Easterly auxiliary truck heater: Final technical report.** Tennessee Technological Univ., Cookeville, TN (United States). Center for Mfg. Research and Technology Utilization. 9 Dec 1991. 41p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FG01-89CE15348. Order Number DE92004434. Source: OSTI; NTIS; GPO Dep.

The objective of this work was to continue the development of the Herbert Easterly heater apparatus for vehicles, such as semi-trailer tractors in order to fully establish its technical feasibility and provide the basis for its commercialization. This heater is auxiliary to the vehicle's primary heating system. With the engine off it heats both the vehicle engine to a temperature at which it starts easily and the vehicle passenger compartment. Specifically, this heater is automatically ignitable, operates directly from the vehicle diesel fuel supply and preheats the vehicle engine fuel prior to combustion. During the course of this work nine different versions of prototype heaters were designed, constructed and tested. All designs were based on the ideas and principles outlined in the Easterly patent. Each successive version incorporated design and fabrication improvements relative to the previous version. The final version, Prototype 9, utilized a multiple water jacket design to capture additional heat from the combustion gases prior to exhausting to the atmosphere. This final prototype exceeded the performance of a commercially available Webasto DBW-2010 using the same commercial burner as the one used in the Webasto unit. The time required to raise the heater fluid temperature by 120°F was 23% less (20 minutes compared to 26 minutes) for Prototype 9 compared to the commercially available unit. In addition a prototype heat exchanger for preheating engine fuel was designed, fabricated and tested. It was also determined that the Prototype 9 auxiliary heater could operate at 85°F for approximately 6 hours on a fully charged 12 volt marine battery rated to deliver 500 cold cranking amps.

6849 (DOE/CE/15449–T8) **Fuel savings in the heavy trucking industry through cool storage: Final report.** Carr, P. Instatherm Co., Cary, NC (United States). 15 Sep 1991. 29p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FG01-89CE15449. Order Number DE92000160. Source: OSTI; NTIS; GPO Dep.

Overnight idling wastes considerable amounts of fuel, contributes to noise and air pollution and adds significantly to trucker's operating costs. Costs are increased because of both the fuel wasted and the additional maintenance required on the engine as a result of extended idling. In winter, idling not only allows a resting driver to keep warm but prevents cold weather battery, fuel gelling and engine starting problems. In the summer, however, the only reason for overnight idling is to keep the sleeper compartment habitable for the resting driver and diesel engine idling to accomplish this is a massive overkill. A novel, patented, cool storage system has been developed by the Instatherm Company. This system allows comfortable summer resting conditions for the driver without having to idle the engine or having to start or run any other auxiliary engine. The operating principle is very straightforward – store "cool" from the truck air conditioning system, while the vehicle is driven on the highway and to use this stored "cool" to air condition the sleeper compartment while the driver rests. 17 figs.

6850 (AFME–88-02-0032) **Study of the effects of pressure and vapour incorporation ratio on the performances of a pelleting machine.** Agence Francaise pour la Maitrise de l'Energie, 75 - Paris (France). 1990. 47p. (In French). Order Number DE92743185. Source: OSTI; NTIS (US Sales Only).

Vapour, in pelleting machine, is used to enhance granulate cohesiveness and machine productivity, reduce power consumption, limit bacteriological activity and reduce the machine wear. In order to optimize the processing costs, vapour feeding have to be specially designed: vapour incorporation mode (distribution line), vapour quantity and vapour pressure. The influences of these factors on the machine performance are described, for various animal foods.

6851 (ANL/CP–72550) **Chemical detoxification of trichloroethylene and 1,1,1-trichloroethane in a microwave discharge plasma reactor at atmospheric pressure.** Krause, T.R.; Helt, J.E. Argonne National Lab., IL (United States). [1991]. 27p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-31109-ENG-38. (CONF-911071–5: American Chemical Society symposium on emerging technologies for hazardous waste management, Atlanta, GA (United States), 1-3 Oct 1991). Order Number DE92003997. Source: OSTI; NTIS; GPO Dep.

This report focuses on the application of plasma technology to hazardous waste treatment. Microwave sustained plasmas are used to thermal degrade trichloroethylene and trichloroethane at atmospheric pressure. (JL)

6852 (CONF-910287–7) **Development of a thermal reclamation system for spent blasting abrasive.** Bryan, B.B.; Mensinger, M.C.; Rehmat, A.G. Institute of Gas Technology, Chicago, IL (United States). [1991]. 18p. Sponsored by Institute of Gas Technology. From National research and development conference on the control of hazardous materials; Anaheim, CA (United States); 20-22 Feb 1991. Source: OSTI; Institute of Gas Technology, 3424 South State Street, Chicago, IL 60616.

Abrasive blasting is the most economical method for paint removal from large surface areas such as the hulls and tanks of oceangoing vessels. Tens of thousands of tons of spent abrasive are generated annually by blasting operations in private and US Navy shipyards. Some of this material is classified as hazardous waste, and nearly all of it is currently being either stockpiled or disposed in landfills. The rapid decline in available landfill space and corresponding rise in landfill tipping fees pose a severe problem for shipyard operators throughout the US. This paper discusses the results of a research and development program initiated by the Institute of Gas Technology and supported by the US Navy to develop and test a fluidized-bed thermal reclamation system for spent abrasive waste minimization. Bench- and pilot-scale reclaimer tests and reclaimed abrasive performance tests are described along with the current status of a program to build and test a 5-ton/hour prototype reclaimer at a US Navy shipyard.

6853 (CONF-911256–3) **Modeled performance of non-chlorinated substitutes for CFC-11 and CFC-12 in centrifugal chillers.** Sand, J.R. (Oak Ridge National Lab., TN (United States)); Fischer, S.K.; Joyner, P.A. Oak Ridge National Lab., TN (United States). [1991]. 10p. Sponsored by U.S. DOE Conservation & Renewable Energy; Electric Power Research Institute. DOE Contract AC05-84OR21400. From International chlorofluorocarbon (CFC) and halon alternatives conference; Baltimore, MD (United States); 3-5 Dec 1991. Order Number DE92004350. Source: OSTI; NTIS; GPO Dep.

Current scientific evidence indicates that stratospheric chlorine concentrations below two parts-per-billion will be necessary to reverse and prevent "ozone hole" formations over the Earth's polar regions each spring. This makes it unlikely that HCFC alternatives with non-zero ozone depletion potentials (ODPs), no matter how small, will be accepted as refrigerants or blowing agents for foamed insulations for the long term. Pressure to eventually eliminate all high volume uses of chlorine containing refrigerants provides a strong incentive to find HFC or alternative, chlorine-free compounds with P-V-T characteristics similar to R-11 and R-123 for new and existing large centrifugal chiller applications. Stable chlorine-free compounds with normal boiling points near CFC-11 and HCFC-123 are found in the fluorinated propane or butane or fluorinated ether families. These larger molecules have larger vapor phase heat capacities (Cp), molecular weights, and lower critical temperatures which thermodynamically decrease their volumetric capacity and coefficient of performance in simple cycle applications. Larger molar latent heats of vaporization caused by hydrogen bonding in the ethers may improve their net refrigerating effect over CFC-11 and HCFC-123, however. Consideration was given to the effects of acoustic velocity in the refrigerant, rotational mach numbers, the application of superheat to avoid "wet isentropic compression," and liquid subcooling before isenthalpic expansion. The results indicate that there are several chlorine-free compounds that give modeled chiller performance comparable to CFC-11 and HCF-123 and better that CFC-12 and HFC-134a. Blends of these refrigerants may be required to mitigate the flammability of some of the alternatives which show the best performance, and modifications to the current chiller cycle such as liquid subcooling and suction gas superhead may offer unique advantages for more complicated, larger refrigerant molecules.

6854 (CONF-920307–2) **Waste minimization at fleet operations.** Holmes, T.S. Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). Health Physics Dept. [1991]. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-89NV10630. From Waste management '92; Tucson, AZ (United States); 1-5 Mar 1992. Order Number DE92004483. Source: OSTI; NTIS; GPO Dep.

Fleet operations affect our everyday lives in many ways. Goods and services arrive and are provided by fleets both large and small, all over the world. The United States Department of Energy has the largest centrally located federal fleet at the Nevada Test Site (NTS). A fleet this size, over 3500 light, medium and heavy duty vehicles, generates considerable waste in the act of operating and maintaining vital functions. The maintenance facilities totaling over 90,000 square feet of floor space, are equipped to address waste minimization in innovative ways. Through the successful implementation of a comprehensive preventive maintenance program waste minimizing at the Fleet Operations Department have resulted in the elimination of approximately 75,000 gallons of waste that was previously generated.

6855 (DOE/CE–40762T-H4) **Report of the CWRT Workshop on: Waste reduction R&D opportunities in industry: Final report.** Eisenhauer, J. Energetics, Inc., Columbia, MD (United States). Sep 1991. 20p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC01-87CE40762. (CONF-9107193–Summ.: Center for Waste Reduction Technologies (CWRT) workshop on waste reduction R&D opportunities in industry, Arlington, VA (United States), 24 Jul 1991). Order Number DE92004697. Source: OSTI; NTIS; GPO Dep.

The Center for Waste Reduction Technologies conducted a workshop on July 24, 1991 to identify key research and development needed to exploit waste reduction opportunities in industry, with particular emphasis on chemical production and use. The purpose is to move toward a consensus of critical R&D needs that could ultimately by pursued by CWRT, individual companies, or government agencies. The follow general findings emerged from the workshop: The workshop was useful in generating a fairly comprehensive list of major R&D needs for industrial chemical production and use. The six priority R&D areas selected for afternoon discussion addressed key industry needs, but might not reflect a consensus of the top waste reduction priorities. There were other worthy R&D opportunities, particularly some that addressed long-term opportunities, that did not get discussed due to time constraints. The need for better technologies and techniques to separate organics, salts, heavy metals, and other constituents from aqueous solutions seemed to underlie much of the discussion in the afternoon. Some felt that separations technology tended to focus too much on near-term industrial waste problems. However, others felt that even with fundamental changes in industrial processes, separations will continue to be a major technological challenge of industry, particularly with dilute waste streams. The group felt that more work was needed to identify R&D needs as part of the CWRT R&D program. In particular, several participants felt that the six selected R&D areas might not reflect the highest priorities of CWRT members, while others felt that the R&D areas might not reflect the highest priorities of CWRT members, while others felt that the R&D issues needed to be discussed in more depth than was possible in the workshop.

6856 (DOE/CH/10093–87) **Conservation and renewable energy technologies for industry.** National Renewable Energy Lab., Golden, CO (United States). Oct 1991. 20p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE91002107. Source: OSTI; NTIS; GPO Dep.

This publication presents current efforts by the US DOE Office of Industrial Technologies to increase national end-use efficiency and promote renewable energy use in industrial applications. This also entails reducing industrial and municipal waste and the associated environmental impacts and hazards. The transfer of research results to commercial practice in such industries as petroleum refining, chemicals, primary metals, pulp and paper, food, and textiles is a vital step in energy conservation. (GHH)

6857 (DOE/EIA–0552(80-88)) **Changes in energy intensity in the manufacturing sector 1980–1988.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 16 Dec 1991. 70p. Sponsored by U.S. DOE Energy Information Administration. Order Number DE92004501. Source: OSTI; NTIS; GPO; GPO Dep.

Numerous recent events – the turmoil in the Soviet Union, Iraq's invasion of Kuwait, the 1990 amendments to the Clean Air Act, the December 1989 crisis in heating oil markets, the 20th anniversary of Earth Day, concerns about global climate change, the development of the National Energy Strategy – have refocused America's attention on energy use. Questions are being asked about the quantities and types of energy consumed by various sectors, the purposes for which energy is consumed, and the potential for improved energy efficiency. The Manufacturing Energy Consumptions Survey (MECS), conducted by the Energy Information Administration (EIA), provides background information for addressing many of these questions for the manufacturing sector. The purpose of this report is to begin to examine the changes in energy efficiency from 1980 to 1988. In this report, energy intensity is defined as the ratio of offsite-produced energy consumption per unit of output. Energy consumption is measured in British thermal units (Btu) and output is measured as the constant dollar value of shipments and receipts. A decrease in energy intensity from one period to another corresponds to an increase in energy efficiency, and vice versa.

6858 (DOE/ER/13676–3) **Screening alternative structures for plant control systems: Progress report, October 1, 1988–September 30, 1989.** Douglas, J.M.; Malone, M.F. Massachusetts Univ., Amherst, MA (United States). Dept. of Chemical Engineering. Jan 1990. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13676. Order Number DE92004314. Source: OSTI; NTIS; GPO Dep.

This report describes progress in the development of a systematic procedure for the screening of chemical process flowsheets using control objectives in combination with economics. Progress in the last year has been in the areas of identification of rules for the screening of steady-state operability in continuous chemical processes and in the development of performance models for complex columns in distillation systems.

6859 (DOE/OSTI–3409/2) **The Office of Industrial Technologies technical reports: A bibliography.** USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). Jan 1992. 117p. Sponsored by U.S. DOE Conservation & Renewable Energy. Order Number DE92000497. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy's Office of Industrial Technologies (OIT) conducts R&D activities which focus on the objectives of improving energy efficiency and providing for fuel flexibility within US industry in the area of industrial energy conservation. The Office also conducts programs to reduce waste generation, increase recycling efforts, and improve the use of wastes as process feedstocks. An active program of technology transfer and education supports these activities and encourages adoption of new technologies. To accomplish these objectives OIT cooperates with the private sector to identify its technological needs and to share R&D efforts. R&D is conducted to the point that a new technology is shown to work and that it can be transferred to the private sector end-users. This bibliography contains information on all scientific and technical reports sponsored by the DOE Industrial Energy Conservation Program during the years 1988–1990.

6860 (EGG-M–91314) **Wet oxidation of oil-bearing sulfide wastes.** Miller, R.L.; Hotz, N.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 11p. Sponsored by U.S. Department of Defense. DOE Contract AC07-76ID01570. (CONF-9103213–1: The Minerals, Metals, and Materials Society (TMS) annual meeting, San Diego, CA (United States), 1-5 Mar 1991). Order Number DE92003286. Source: OSTI; NTIS; GPO Dep.

Oil-bearing metal sulfide sludges produced in treatment of an industrial wastewater, which includes plating wastes, have yielded to treatment by electrooxidation and hydrogen peroxide processes. The oxidation can be controlled to be mild enough to avoid decomposition of the organic phase while oxidizing the sulfides to sulfates. The pH is controlled to near neutral conditions where iron, aluminum and chromium(III) precipitate as hydrous oxides. Other metals, such as lead and barium, may be present as sulfate precipitates with limited solubility, while metals such as nickel and cadmium would be present as complexed ions in a sulfate solution. The oxidations were found to proceed smoothly, without vigorous reaction; heat liberation was minimal. 2 refs., 12 figs.

6861 (EGG-M–91315) **Froth flotation of oil-bearing metal sulfide wastes.** Miller, R.L. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Atwood, R.L.; Ye, Yi. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 10p. Sponsored by U.S. Department of Defense. DOE Contract AC07-76ID01570. (CONF-920305–2: Minerals, Metals, and Materials Society (TMS) annual meeting and exhibition, San Diego, CA (United States), 1-5 Mar 1992). Order Number DE92003285. Source: OSTI; NTIS; GPO Dep.

An industrial wastewater, including plating wastes, is treated with sodium sulfide and ferrous sulfate to form a sulfide-oxide precipitate containing chromium and other toxic metals. Hydrocarbons, in the water, coat the sulfide-oxide particles, impeding metal recovery. Froth flotation, without reagent addition, was found to recover 93.9% of the solids from the sludge with simultaneous rejection of 89% of the water. Methyl isobutyl carbinol (MIBC) improved recovery and potassium amyl xanthate improved both recovery and grade. The process design has wastewater feed (without MIBC) to the rougher circuit. The rougher concentrate is conditioned with MIBC and fed to a cleaner circuit to achieve a high grade concentrate. About 95% of the water is recirculated to the waste treatment plant. 3 refs., 3 figs., 4 tabs.

6862 (ENEA-RT-AMB--90-35) **Scrapped automobiles and waste tyres: Waste management problematics.** Coronidi, M. ENEA, Casaccia (Italy). Area Energia, Ambiente e Salute. Apr 1991. 35p. (In Italian). (RT/AMB--90-35). Order Number DE92743979. Source: OSTI; NTIS (US Sales Only).

This paper first discusses the environmental protection criteria behind Italian pollution laws relative to scrapped automobile and waste tyres. An assessment is then made of relative present and forecasted waste quantities. The various techniques of wreck recovery and disposal are analyzed and the proposed provisions relevant to the Italian Abruzzo Region are outlined. The production of refuse tyres is discussed together with various techniques of waste tyre recycling. Several options of tyre disposal are described. Particular attention is given to combustion and pyrolysis technologies that allow materials and/or energy recovery.

6863 (KCP--613-4528) **Water-based cleaning fundamentals.** Harding, W.B. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Dec 1991. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. Order Number DE92004881. Source: OSTI; NTIS; GPO Dep.

A basic description of water-based alkaline cleaning is presented, The nature of soils is described. The compositions of conventional cleaning compounds are given with descriptions of the functions of the ingredients. The mechanisms by which soil is removed are explained. The degrees of cleanliness required, along with the influence of the material being cleaned, are discussed. Tests for cleanliness are described.

6864 (KCP--613-4530) **Electromechanical assembly department manufacturing improvements: Final report.** Voss, S.W. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Dec 1991. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. Order Number DE92004792. Source: OSTI; NTIS; GPO Dep.

Techniques for streamlining the processing and flow of products is an electromechanical assembly department were evaluated. Areas looked at included a paperless system for lot identification records, automated tool and fixture storage, evaluation of product transfer methods, and queue time reduction.

6865 (NREL/TP--232-4237) **Wastepaper as a feedstock for ethanol production.** Bergeron, P.W.; Riley, C.J. National Renewable Energy Lab., Golden, CO (United States). Nov 1991. 23p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE92001174. Source: OSTI; NTIS; GPO Dep.

The possibility of using wastepaper as a cheap feedstock for production of ethanol is discussed. As the single largest material category in the municipal solid waste (MSW) stream, wastepaper is the main target of efforts to reduce the volume of MSW. And in the process for producing ethanol from lignocellulosics, the feedstock represents the highest cost. If wastepaper could be obtained cheaply in large enough quantities and if conversion process cost and efficiency prove to be similar to those for wood, the cost of ethanol could be significantly reduced. At the same time, the volume of wastepaper that must be disposed of in landfills could be lessened. 13 refs., 3 figs., 7 tabs.

6866 **Destruction of organic wastes with molten oxidizers.** Bradshaw, R.W.; Holmes, J.T.; Tyner, C.E. To Dept. of Energy. 1990. Filed date 2 Apr 1990. USA Patent patent application 7-502,957. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92003833. Source: OSTI; NTIS; GPO Dep.

A process for destruction of biologically hazardous organic chemical wastes by using liquefied strongly oxidizing inorganic salts, such as the alkali metal nitrates, at high temperatures and atmospheric pressure, to yield inorganic salts, carbon dioxide, and water. The oxidizing salts are regenerated and recycled.

6867 (CONF-9111137--4-Extd.Abst.) **Assessing demand and supply resources in electric-utility planning.** Hill, L.J. Oak Ridge National Lab., TN (United States). [1991]. 31p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From Western Area Power Administration Conservation and Renewable Energy Program integrated resource planning seminar; Sacramento, CA (United States); 19-20 Nov 1991. Order Number DE92004224. Source: OSTI; NTIS; GPO Dep.

The Western Area Power Administration (WAPA), a federal power marketing agency that transmits federally produced electric power in the Western United States, recently intensified its promotion of integrated resource planning (IRP) for the distribution companies that purchase its power. As part of its promotion, WAPA organized a series of workshops on various aspects of the IRP process. This presentation is part of those workshops. The presentation addresses three topics. The first two provide background: (1) definitions of IRP and demand-side management (DSM) and their historical evolution and (2) IRP as part of a dynamic process, including the motivation for electric utilities to engage in IRP, the IRP process itself, and the implementation and evaluation of DSM programs and supply resources that are selected in the planning process. The body of the presentation addresses the process of integrating DSM and supply resources and two complicating factors in that process. The three methods to integrate DSM and supply resources include: (1) a sequential approach, selecting DSM resources first, then supply resources; (2) a sequential approach, selecting supply resources first, then DSM resources; and (3) a simultaneous approach in which DSM and supply resources are selected together. Current ORNL research on the resource selection biases associated with the three approaches is then discussed. The first complicating factor in integration is accounting for the different dimensions of DSM and supply resources, especially their economic and reliability dimensions. The second factor is determining a cost- or rate-based criterion for selecting resources. Current ORNL research on this topic complements the discussion.

6868 (CRIE-Y--90018) **Planning procedure for public lighting.** Iuchi, M. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)); Yamaoto, K. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Apr 1991. 37p. (In Japanese). Order Number DE92749205. Source: OSTI; NTIS (US Sales Only).

A framework for the planning procedure is proposed to establish plans for lighting a city as a whole including the daily living space for residents to realize affluent national life and achieve well balanced public lighting in urban areas. The consciousness of urban residents to night-time environment comprises agreeableness with beauty and good atmosphere, static acativeness like quietness and composure, and attractiveness including intimacy and joyfulness. A questionnaire survey result reveals that most residents want such lighting be arranged in nearby squares or parks that enables calm and pleasant night-time activities. It is important to establish a lighting plan balanced both in regional and city scales, based on these needs of the residents. Also critical is to select the most effective business system including implementation systems and related organizations, and discuss specific processes in advance, including regulation and guidance of neon sign and signboard installations. 14 refs., 22 figs., 8 tabs.

6869 (DOE/BP--1677) **Commercial sector infrastructure study: Final report, July 23, 1991.** Sparling, S.; Gard, B.; Gordon, F. USDOE Bonneville Power Administration, Portland, OR (United States). Jul 1991. 90p. Sponsored by U.S. DOE Conservation & Renewable Energy. Order Number DE92005359. Source: OSTI; NTIS; GPO Dep.

Achieving greater energy efficiency in the commercial sector requires an infrastructure capable of delivering those savings. The infrastructure is defined as the people and equipment needed to deliver efficiency savings. For example, the infrastructure is made up (in part) of the people skilled in commercial energy analysis available to work at utilities and engineering firms, the distributions who sell energy-efficient equipment, the contractors who install the equipment, and the equipment itself. This report examines the commercial infrastructure in the Bonneville Power Administration region. In June and July 1991 interviews were conducted with utilities, engineering firms, energy service companies, distributors, contractors, installers and manufacturer's reps to assess the current status of the infrastructure. Also, participants were asked to identify any shortages in the labor pool or equipment supply that might occur if the region doubled or tripled the amount of commercial sector conversation activity. Program design issues – such as the amount of money available for rebates or incentives, the types of buildings that are targeted, overall program goals, reporting requirements, etc. – were not addressed in this study.

6870 (KFK–4923) **Experiments towards the stationary and dynamical behavior of the combustion at the incineration research plant TAMARA.** Mittag, K.; Dittrich, H.G. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Datenverarbeitung in der Technik; Kernforschungszentrum Karlsruhe GmbH (Germany). Lab. fuer Isotopentechnik. Sep 1991. 28p. (In German). Order Number DE92750259. Source: OSTI; NTIS (US Sales Only).

The knowledge of the dynamical behavior of the combustion concerning changes in process states is a necessary requirement for an optimal process control of an incineration plant. In this context experiments were run at the incineration research plant TAMARA in which the under-grate-air and the waste streams were changed in steps after sufficiently long stationary operation periods. In addition some experiments were done replacing the waste by wood. The resulting changes in oxygen and carbondioxide concentrations, on combustion and grate temperatures as well as on the length of the grate fire were analysed both for the stationary and for the dynamical behavior. Sudden changes in the under-grate-air causes the combustion state described by oxygen and carbon dioxide concentrations as well as by combustion temperature to move temporarily into a direction opposite to the stationary state. This is caused by a suddenly and temporarily increased or decreased combustion on the grate due to the increased or decreased under-grate-air. In addition the possibilities to use the correlation analysis for process control are demonstrated in determining the time delay between state variables and determining instrument faults. (orig.).

6871 (ORNL/CON–342) **Evaluation of the computerized utilities energy monitoring and control system installed at the US Military Community at Goeppingen, Germany.** Purucker, S.L.; Gettings, M.B. Oak Ridge National Lab., TN (United States). 18 Nov 1991. 58p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE92004600. Source: OSTI; NTIS; GPO Dep.

Under the provisions of an Interagency Agreement between the US Army and the Department of Energy, Martin Marietta Energy Systems, Inc., through the Oak Ridge National Laboratory, is evaluating the Utilities and Energy Monitoring and Control System (UEMCS) installed at the US Military Community Activity at Goeppingen, Germany. This evaluation relies on examination of existing data and information to determine the effectiveness of the UEMCS. The Goeppingen UEMCS is an integral part of a combined UEMCS/district heating system which includes the UEMCS at Schwaebisch Gmuend, Germany. The system was installed during 1985 and 1986. The UEMCS at Goeppingen and Schwaebisch Gmuend are both well designed, implemented, and maintained. The UEMCS is operated in a supervisory mode with distributed intelligence in local controllers. At present, the UEMCS is operated in a supervisory mode with distributed intelligence in local controllers. At present, the UEMCS at Schwaebisch Gmuend does not have a central computer, but requires only a dedicated phone line to couple with the one at Goeppingen. Though the conversion to district heat has produced the majority of energy savings, the UEMCS day/night setback program also contributes substantially, with additional savings from start/stop programs, such as seasonal switchover, and various temperature control programs. Further opportunities for savings exist in increasing monitoring and control of water usage and connecting the community's electrical network to the UEMCS, permitting demand limiting and increased power factor control.

33 ADVANCED PROPULSION SYSTEMS

6872 **Reflector for efficient coupling of a laser beam to air or other fluids.** Kare, J.T. To Dept. of Energy. 1990. Filed date 18 Jul 1990. USA Patent patent application 7-554,728. 27p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003824. Source: OSTI; NTIS; GPO Dep.

A reflector array is disclosed herein that provides a controlled region or regions of plasma breakdowns from a laser beam produced at a remotely-based laser source. The plasma may be applied to produce thrust to propel a spacecraft, or to diagnose a laser beam, or to produce shockwaves. The spacecraft propulsion system comprises a reflector array attached to the vehicle. The reflector array comprises a plurality of reflectors spaced apart on a reflective surface, with each reflector acting as an independent focusing mirror. The reflectors are spaced closely together to form a continuous or partially-continuous surface. The reflector array may be formed from a sheet of reflective material, such as copper or aluminum. In operation, a beam of electromagnetic energy, such as a laser beam, is directed at the reflectors which focus the reflected electromagnetic energy at a plurality of regions off the surface. The energy concentrated in the focal region causes a breakdown of the air or other fluids in the focal region, creating a plasma. Electromagnetic energy is absorbed in the plasma and it grows in volume, compressing and heating the adjacent fluid thereby providing thrust. Laser pulses may be applied repetitively. After each such thrust pulse, fresh air can be introduced next to the surface either laterally, or through a perforated surface. If air or some other gas or vapor is supplied, for example from a tank carried on board a vehicle, this invention may also be used to provide thrust in a vacuum environment. 8 figs.

6873 (CONF-9109230–7) **Fiber-sensor design for turbine engines.** Tobin, K.W. Jr. (Oak Ridge National Lab., TN (United States)); Beshears, D.L.; Turley, W.D.; Lewis, W. III; Noel, B.W. Oak Ridge National Lab., TN (United States). Aug 1991. 10p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400 ;W-7405-ENG-36. From SPIE meeting; Boston, MA (United States); 3-6 Sep 1991. Order Number DE92003539. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Determination of blade temperatures in the high speed and turbulent environment of a turbine engine is difficult using standard pyrometry techniques because of the presence of high temperature flame and the reflective nature of the inspection surfaces. A technique utilizing thermographic phosphor compounds bonded to engine vanes and turbine blades is presented that mitigates the negative effects of blackbody radiation while potentially allowing near real-time acquisition of blade temperature information. Specialized single and dual fiber-optic probes were designed to interrogate both fixed and rotating surfaces by delivering ultraviolet light from a quadrupled Nd:YAG (266 nm) laser to phosphor coatings consisting of Y_2O_3:Eu, YVO_4:Eu, and YAG:Tb ceramic compound. This technique utilizes the temperature-dependent fluorescent emission of a ceramic phosphor coating to discern the temperature of the interrogated surface. By using these methods, surface temperature measurements to 1200°C are achievable in the combustion environment.

6874 (DOE/ER/12115–1) **The railplug: Development of a new ignitor for internal combustion engines: Annual report, January 16, 1991–January 15, 1992.** Matthew, R.D.; Nichols, S.P.; Weldon, W.F. Texas Univ., Austin, TX (United States). Oct 1991. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-91ER12115. (CONF-9110283–1: Initial studies of a new type of ignitor: the railplug, Toronto, Ontario (Canada), 7-10 Oct 1991). Order Number DE92002578. Source: OSTI; NTIS; GPO Dep.

The goal of the railplug project is to commercialize this miniaturized railgun as an engine technology as rapidly as possible. To improve the technology transfer process, a board of industrial advisors was established. A list of representatives is included at the end of this annual report. The Railplug External Advisory Board (REAB) met in Austin on March 17–18, 1991 to discuss the project plan. A list of comments from the REAB is included at the end of this progress report, along with our written response to those comments. An alternate "first" meeting with some representatives of the REAB was held on July 9, 1991. This meeting was attended by most of the board members who were unable to attend the first meeting. The second meeting of the REAB was held in Toronto, Canada, on October 10, 1991. A list of the board members comments from this meeting is included at the end of this report, along with our written response to those comments. These meetings have proven to be most useful in assuring that this project is conducted as efficiently as possible. The railplug project is essentially divided into three main tasks: (1) Railplug system development; (2) application of railplugs to engines; and (3) railplug durability. The status of each of these tasks is described below.

6875 (DOE/MC/25124–3014) **Conceptual design of coal-fueled diesel system for stationary power applications.** Little (Arthur D.), Inc., Cambridge, MA (United States). May 1989. 314p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC21-88MC25124. Order Number DE91002094. Source: OSTI; NTIS; GPO Dep.

A preliminary conceptual design of a coal-fueled diesel system was prepared as part of a previous systems study. Since then, our team has accumulated extensive results from testing coal-water slurry on the 13-inch bore JS engine (400 rpm) in 1987 and 1988. These results provided new insights into preferred design concepts for engine components. One objective, therefore, was to revise the preliminary design to incorporate these preferred design concepts. In addition there were certain areas where additional, more detailed analysis was required as a result of the previous conceptual design. Another objective, therefore was to perform additional detailed design efforts, such as: (1) market applications and engine sizes, (2) coal-water slurry cleaning and grinding processes, (3) emission controls and hot gas contaminant controls, (4) component durability, (5) cost and performance assessments. (VC)

6876 (DOE/MC/26044–T28) **Wear mechanism and wear prevention in coal-fueled diesel engines: Monthly progress report, 27 April 1990–25 May 1990.** Southwest Research Inst., San Antonio, TX (United States). 20 Jun 1990. 6p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC21-89MC26044. Order Number DE92003473. Source: OSTI; NTIS; GPO Dep.

The overall objective of this program is to develop the diesel engine and lubricant system design approach that has the highest probability for commercial acceptance. Several specific objectives can also be identified. These objectives include: Definition of the dominant wear mechanisms prevailing in coal-fueled diesel engines; Definition of the specific effect of each coal-related lube oil contaminant; Determination of the potential of traditional engine lubrication design approaches to either solve or mitigate the effects of the coal related lube oil contaminants; Evaluation of several different engine design approaches aimed specifically at preventing lube oil contamination or preventing damage due to lube oil contamination; and Presentation of the engine/lubricant system design determined to have the most potential.

6877 (ETDE-mf–2758979) **Investigations on the influence of strongly increased fuel injection pressure on the performance of a direct-injection diesel engine.** Thiesen, U.P. Technische Univ. Braunschweig (Germany). Fakultaet fuer Maschinenbau und Elektrotechnik. 20 Dec 1990 136p. (In German). Order Number DE92758979. Source: OSTI; NTIS (US Sales Only).

It was examined whether a better exhaust gas quality is attainable with a higher injection pressure without negative effects on fuel consumption. General remarks are made at the beginning on the situation of the commercial vehicle diesel engine with regard to future pollutant limiting values. The experimental setup and the testing procedure are described (experimental engine, test stand, varied parameters), and the evaluation method and computation technique for analysis of the measurements are introduced. The cylinder pressure curve was evaluated; the nitrogen oxide emission was computed; a model for the fuel processing and fuel distribution in the combustion chamber was constructed. Results of tests with unchanged injection time are reported, as well as the influence of the injection time, the swirl speed/nozzle hole number and the combustion chamber diameter. Finally it is reported how the parameters of the energy conversion influence fuel consumption and the NO emission. It was found out in total that the high pressure injection is an interesting development objective (improved exhaust gas quality with still acceptable fuel consumption increase). (HWJ).

6878 (DOE/ID/13074–T1) **Kansas State University Electric Vehicle Site Operator Program: Year 1: First quarter report, July 2, 1991–September 30, 1991.** Hague, J.R.; Steinert, R.A.; Nissen-Pfrang, T. Kansas State Univ., Manhattan, KS (United States). Coll. of Engineering. [1991]. 13p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract FC07-91ID13074. Order Number DE92004326. Source: OSTI; NTIS; GPO Dep.

During the past fifteen years Kansas State's faculty has been involved in research of alternative fuel vehicles. From formulation of fuels and automotive fuel storage to development of electronic controls, K-State's faculty research has been ongoing. With the increased awareness of what is occurring to the world's environment, the catalyst – to ensure applied results from faculty research will occur – has been activated. The Department of Energy's Electric Vehicle Site Operator Program is the platform being used to demonstrate international efforts to bring a more acceptable daily mode of transportation to our highways. The first new electrical vehicle procured at K-State in the last ten years, a G-Van, is a technological dinosaur. It does not incorporate leading edge control or drive systems nor does it provide the type of vehicle frame and body to meet a majority of the daily commuter needs required by the American market. Yet, this vehicle represents initial efforts to bring a federally crash certified vehicle to the commercial automotive market. As such, it is an evolutionary step in the mass production of electric vehicle products.

6879 **Catalytic converter.** Liber, B. 22 Aug 1991. Filed date 22 Feb 1990. Canada Patent patent application 2010754. 39p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

A catalytic converter is provided which is economical to manufacture and is not readily poisoned by contaminants in a gas stream such as would be encountered in the operation of an internal combustion engine, whereby an improved life expectancy of the unit can be achieved. The converter of the invention comprises a sintered porous body including molybdenum or a molybdenum-containing compound or a molybdenum complex. A method of forming a catlytic converter unit comprises forming a slurry including molybdenum or a molybdenum compound, forming the slurry into a sintered body member, and hardening or curing the same to form a self-sustaining body member. A method for treating an exhaust gas using the above catalytic converter is also disclosed. A preferred embodiment for an internal combustion engine is described. Examples of different catalytic compositions are included. 13 figs.

6880 **Microwave diesel scrubber assembly.** Walton, F.B.; Hayward, P.J.; Adams, F.P. 21 Aug 1991. Filed date 21 Feb 1990. Canada Patent patent application 2010546. 24p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

A filter assembly for a diesel engine comprises, in combination, a housing defining an exhaust gas passage having an inlet end and an outlet end and a cavity intermediate those two ends and in serial fluid communication with them. The cavity defines an electromagnetically resonant coaxial line waveguide. A filter is disposed within the cavity for removing particulate products of combustion from the exhaust gases passing through the cavity. A mechanism is provided for producing axisymmetrically distributed standing electromagnetic waves within the cavity in order to couple electromagnetic energy in the waves into lossy material in the cavity. In this manner, heat is produced for incinerating the particulates accumulated on the filter, thus regenerating the filter. 6 figs.

Published in the official languages of the United Nations.

The Third Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons will be held in Geneva, Switzerland, in 1985 with a view to assuring that the purposes and provisions of the Treaty are being realized. The Treaty, commonly referred to as the non-proliferation Treaty, is the fundamental instrument to avert the danger of proliferation of nuclear weapons and is, perhaps, the most important multilateral arms regulation agreement of our time. It was negotiated in the 1960s in the Eighteen-Nation Committee on Disarmament in Geneva and in the United Nations General Assembly. The Treaty was opened for signature in London, Moscow and Washington on July 1, 1968. On that date, it was signed by the three Depositary Governments - the Soviet Union, the United Kingdom and the United States - and by 58 other States. As of December 31, 1983 the number of States parties to the Treaty had risen to 119.

Published in the official languages of the United Nations.

The Third Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons was held in Geneva from 27 August to 21 September 1985, with a view to assuring that the purposes and provisions of the Treaty were being realized. The Conference ended with the adoption by consensus of a Final Declaration, by which the States parties, among other things, solemnly declared their conviction that the Treaty was essential to international peace and security and expressed their support for its objectives. This Fact Sheet provides information on the preparations for the Conference, developments at the Conference and the main features of the Final Declaration. The text of the Treaty is reproduced in Disarmament Fact Sheet No. 33, and its historical background is contained in Fact Sheet No. 41.

6884 (INIS-mf--13045) **Towards the fourth review conference of the Non-Proliferation Treaty in 1990.** Disarmament facts. United Nations, New York, NY (USA). Dept. for Disarmament Affairs. Jul 1989 24p. Order Number DE92614097. Source: OSTI; NTIS (US Sales Only); INIS.

Published in the official languages of the United Nations.

This publication focuses on the background of the Treaty on the Non-Proliferation of Nuclear Weapons (NPT), its main provisions and some of the major issues discussed at the three conferences that have thus far been held to review the operation of the Treaty. A fourth conference to review the operation of the Treaty will be held at Geneva from 20 August to 14 September 1990. It will be the last regular review conference before the convening, in 1995, of a conference which will "decide whether the Treaty shall continue in force indefinitely or shall be extended for an additional fixed period or periods" (article X, para.2). A Preparatory Committee (open to all parties) for the Fourth Review Conference has been established by the parties to the NPT, and 95 parties attended the first session, held in New York from 1 to 5 May 1989.

6885 (INIS-mf--13046) **Treaty for the prohibition of nuclear weapons in Latin America (Treaty of Tlatelolco).** Disarmament facts. United Nations, New York, NY (USA). Dept. for Disarmament Affairs. Sep 1989 15p. Order Number DE92614098. Source: OSTI; NTIS (US Sales Only); INIS.

Published in the official languages of the United Nations.

The Treaty of Tlatelolco enhances the security of the countries of the region by reducing the risk of a nuclear-arms race among them, with all the danger and cost that it would entail, and, as a contribution to the world-wide nuclear non-proliferation regime, it constitutes an important confidence-building measure by ensuring, through its control and verification system, that parties to the Treaty do not posses and will not acquire nuclear weapons. List of parties to the Treaty of Tlatelolco as of 31 July 1989: Antigua and Barbuda, Bahamas, Barbados, Bolivia, Brazil (not full party), Chile (not full party), Colombia, Costa Rica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Suriname, Trinidad and Tobago, Uruguay and Venezuela. (Argentina and Dominica have signed the Treaty).

Published in the official languages of the United Nations.

The conclusion of a comprehensive nuclear test ban is of critical importance for the future of arms limitation and disarmament. As the 1980 report of the Secretary-General concluded, a comprehensive nuclear test ban is regarded as the first and most urgent step towards the cessation of the nuclear arms race and, in particular, of its qualitative aspects. It could serve as an important measure for the non-proliferation of nuclear weapons, both vertical and horizontal. It would have a major arms limitation impact in that it would make it difficult, if not impossible, to develop new designs of nuclear weapons and would also place constraints on the modification of existing weapon designs. The permanent cessation of all nuclear-weapon tests has long been sought by the world community and its achievement would be an event of great international significance.

6887 (INIS-mf--13084) **The Non-Proliferation Treaty: Fifteen years after entry into force.** Disarmament fact sheet. United Nations, New York, NY (USA). Dept. for Disarmament Affairs. Jul 1985 15p. Order Number DE92615185. Source: OSTI; NTIS (US Sales Only); INIS.

Published in the official languages of the United Nations.

The need to halt a wider spread of nuclear weapons grew out of the realization that the increase in the number of countries possessing such weapons would increase the threat to world security. As the Treaty on the Non-Proliferation of Nuclear Weapons clearly states in its preamble, the proliferation of nuclear weapons would seriously enhance the danger of nuclear war. The Treaty - also known as the non-proliferation Treaty - was concluded in 1968, at a time when there were already five nuclear-weapon Powers: the United States, the Soviet Union, the United Kingdom, France and China. This fact sheet is intended to provide background material on the Treaty, including the events that led to its conclusion, an overview of its provisions and the developments at the two previously held Review Conferences.

6888 (UCRL-JC-106720) **International defenses against ballistic missile attack: Now, more than ever.** Wood, L. Lawrence Livermore National Lab., CA (United States). 4 Mar 1991. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9102142-1: Defending America in the 1990s, Washington, DC (United States), 20-21 Feb 1991). Order Number DE92003062. Source: OSTI; NTIS; GPO Dep.

This speech, made soon after Desert Storm, presents ideas on the threat of ballistic missiles to the United States. The availability of the missiles to third world countries is discussed. Strong support for the assigned mission of the Strategic Defense Initiative Organization known as Global Protection Against Limited Strikes (GPALS) is made. Also, implications to the ABM treaty are made. (GHH)

A survey of international efforts from the partial test-ban Treaty (in atmosphere, in outer space and under water) in 1963 to the Soviet-USA negotiations on verification measures for the threshold test-ban Treaty is given. As was the case in the bilateral and trilateral negotiations, the question of adequate verification procedures has remained one of the major problems in the multilateral considerations on a comprehensive test ban. Over the years, a number of proposals have been made in order to solve the issue, in particular by Sweden and by the Soviet Union. In 1988, the four experimental data centres, situated in Canberra, Moscow, Stockholm and Washington, carried out separate and joint experiments in analysis methodology. Communication techniques between the four international data centres and a number of national seismological stations were also tested. In addition, a global data-gathering experiment was conducted, resulting in the creation of an initial research data base at the experimental data centre in Canberra. Further technical experiments are planned for 1989, and in 1990 a large-scale experiment in data exchange and analysis, involving up to a hundred seismological stations globally and lasting several months, is foreseen.

The authors goal is to provide higher quality coatings to LLNL programs by using ion-based physical vapor deposition technology. Their research efforts have been directed toward achieving higher density, greater purity, improved adhesion, and for ceramic coatings, more precise stoichiometry. To achieve these goals, they have employed both theoretical and experimental research programs. In their experimental efforts, they explored four distinct approaches for making coatings, each of which offers particular advantages for specific applications. These approaches included two types of cathodic arcs, an anodic arc, and an unbalanced magnetron source. In the first phase of their theoretical modeling, they made significant strides in understanding the motion of plasmas in relatively weak magnetic fields. This understanding allowed them to explore a number of experimental approaches that have, in turn, enabled them to refine and validate their theoretical models. The second phase of their theoretical modeling investigated the kinds of coating structures that they can expect to result from condensation of ions which have specific energy distributions. In FY 91, they will compare results from the condensation modeling with the experimental results of the carbon system. They will use this comparison to determine new methods of producing diamond coatings with improved optical transparency for use in protecting infrared windows from abrasion. As in the case of plasma transport modeling, they will use the experimental results to refine and validate the ion condensation models.

This report discusses the lubrication of different joints subjected to fretting corrosion. Wear of metal-to-metal, and metal-to-ceramic joints is discussed. (JL)

6893 (ANL/CP-73625) **Interdiffusion and grain-boundary migration in Au-Cu bilayers during ion-irradiation.** Alexander, D.E.; Rehn, L.E.; Baldo, P.M. Argonne National Lab., IL (United States). Nov 1991. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-911202-19: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92005238. Source: OSTI; NTIS; INIS; GPO Dep.

Ion irradiation and annealing experiments have been conducted on Au/Cu bilayer films to evaluate the effect of irradiation on diffusion-induced grain boundary migration (DIGM). The Au films were prepared with a large-grained microstructure with grain boundaries perpendicular to the film surface and extending through the film thickness. Irradiations were conducted with 1.5 MeV Kr at 228°C. Rutherford backscattering spectrometry of the samples revealed that interdiffusion was substantially enhanced in the irradiated area relative to the unirradiated area. Both irradiated and annealed-only areas were characterized by a nearly uniform composition of 14 at.% and 7 at.% Cu respectively through the entire thickness of the underlying Au film. Small probe X-ray energy dispersive spectroscopy showed significant lateral compositional homogeneities in both irradiated and annealed areas. These two results are consistent with previous observations of DIGM in the Au/Cu system, suggesting that this previously unexamined mechanism contributes to ion beam mixing.

6894 (ANL/CP–74482) **Small angle neutron scattering from nanometer grain sized materials.** Epperson, J.E.; Siegel, R.W. Argonne National Lab., IL (United States). Nov 1991. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9111164–2: International workshop on studies of magnetic properties of fine particles and their relevance to materials science, Rome (Italy), 4-8 Nov 1991). Order Number DE92005241. Source: OSTI; NTIS; GPO Dep.

Small angle neutron scattering has been utilized, along with a number of complementary characterization methods suitable to the nanometer size scale, to investigate the structures of cluster-assembled nanophase materials. Results of these investigations are described and problems and opportunities in using small angle scattering for elucidating nanostructures are discussed.

6895 (ANL/CP–74837) **Magnetism of thin film multilayers: An analogue of interacting platelets.** Felcher, G.P.; Huang, Y.Y. Argonne National Lab., IL (United States). Nov 1991. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9106180–2: NATO Advanced Study Institute conference, Acquafredda di Maratea (Italy), 11-21 Jun 1991). Order Number DE92004129. Source: OSTI; NTIS; GPO Dep.

Progress is being made toward manufacturing materials with magnetic properties tailored to the desired application. This result is reached in several steps, which are monitored with different optical techniques such as polarized neutron reflectometry. First, ferromagnetic, metallic films (of Fe, Co, Ni, Gd), a few nanometers thick, are prepared by vapor deposition. Their magnetization can be tuned by changing the chemistry of thickness of the films, and can be biased by embedding the films into a matrix of antiferromagnetic material. Ensembles of metallic films (multilayers of superlattices) can be created, with a magnetic coupling between adjacent layers regulated by the nature and thickness of the spacer. For increasing spacer thickness, the alignment of neighboring magnetic layers switches between a parallel (F) and an opposite arrangement (AF) in an oscillatory manner. In multilayer structures possessing more than one kind of magnetic atom complex magnetic phase diagrams have been predicted to occur, with properties that are strongly influenced by the presence of a surface. With these characteristics, the phenomenology of magnetic multilayers draws a close similarity to the physics of interacting platelets.

6896 (ANL/CP–74998) **Equilibrium and non-equilibrium metal-ceramic interfaces.** Gao, Y.; Merkle, K.L. Argonne National Lab., IL (United States). [1991]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-911202–17: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92004975. Source: OSTI; NTIS; GPO Dep.

Metal-ceramic interfaces in thermodynamic equilibrium (Au/ZrO$_2$) and non-equilibrium (Au/MgO) have been studied by TEM and HREM. In the Au/ZrO$_2$ system, ZrO$_2$ precipitates formed by internal oxidation of a 7%Zr-Au alloy show a cubic ZrO$_2$ phase. It appears that formation of the cubic ZrO$_2$ is facilitated by alignment with the Au matrix. Most of the ZrO$_2$ precipitates have a perfect cube-on-cube orientation relationship with the Au matrix. The large number of interfacial steps observed in a short-time annealing experiment indicate that the precipitates are formed by the ledge growth mechanism. The lowest interfacial energy is indicated by the dominance of closed-packed [111] Au/ZrO$_2$ interfaces. In the Au/MgO system, composite films with small MgO smoke particles embedded in a Au matrix were prepared by a thin film technique. HREM observations show that most of the Au/MgO interfaces have a strong tendency to maintain a dense lattice structure across the interfaces irrespective of whether the interfaces are incoherent of semi-coherent. This indicates that there may be relatively strong bond between MgO and Au.

6897 (BNL–46846) **Some effects of porosity and HIP'ing on critical currents in internal-tin-processed multifilamentary Nb$_3$Sn wires.** Gregory, E. (IGC/Advanced Superconductors, Inc., Waterbury, CT (United States)); Ozeryansky, G.M.; Suenaga, M. Brookhaven National Lab., Upton, NY (United States). [1991]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-9110306–1: 7. US-Japan workshop on high-field superconductors, Fukuoka (Japan), 21-23 Oct 1991). Order Number DE92005034. Source: OSTI; NTIS; INIS; GPO Dep.

The extent and nature of the porosity developed in both tin-core and tin-ring internal tin NB$_3$Sn materials has been tentatively explored. The porosity was reduced by HIP'ing either after the final heat treatment or at an intermediate state. The J_c in the HIP'd materials appears to be improved at fields below 15 T, but above this field the HIP'd 19 subelement material shows lower J_c's at zero applied strain.

6898 (CONF-910909–13) **Cracking behavior of cored structures.** Wahid, A. (Colorado School of Mines, Golden, CO (United States). Center for Welding and Joining Research); Olson, D.L.; Matlock, D.K.; Kelly, T.J. Colorado School of Mines, Golden, CO (United States). [1991]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER45308. From 1. international conference on heat-resistant materials; Lake Geneva, WI (United States); 22-26 Sep 1991. Order Number DE92005193. Source: OSTI; NTIS; GPO Dep.

The effects of compositional gradients, are considered based on a thermodynamic analysis, referred to as the Cahn-Hillard analysis, which describes the degree to which a local surface energy is modified by the presence of a composition gradient. The analysis predicts that both ductile and brittle fracture mechanisms are enhanced by the presence of a composition gradient. Data on stress corrosion cracking and fatigue crack growth in selected FCC alloys are used to illustrate the significance of microsegregation on mechanical properties.

6899 (CONF-911132–11) **Poly-Si etching using an electron cyclotron resonance microwave plasma sources with multipole confinement.** Gorbatkin, S.M. (Oak Ridge National Lab., TN (United States)); Berry, L.A.; Swyers, J. Oak Ridge National Lab., TN (United States). [1991]. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 38. national symposium of the American Vacuum Society; Seattle, WA (United States); 11-15 Nov 1991. Order Number DE92005114. Source: OSTI; NTIS; GPO Dep.

In this study, mirror field and single coil 2.45 GHz electron cyclotron resonance (ECR) microwave plasma sources were coupled to a multipole, multicusp plasma confinement system, and used to produce chlorine plasmas for poly-Si etching. Scanning Langmuir probes were used to study the effect of process parameters on plasma potentials, plasma density, plasma density uniformity, and electron temperature, while poly-Si etching experiments on 150-mm diam wafers were used to relate process parameters and Langmuir probe results to etch rate, SiO$_2$ selectivity, photo-resist selectivity, and etch uniformity. RF substrate bias at 13.56 MHz was used for ion energy control, and the addition of a third coil below the substrate plane was found useful for fine-tuning the radial plasma uniformity. Undoped poly-Si etch rates >3000 Å/min, Si/SiO$_2$ etch selectivities >25, and 150-mm diam etch uniformities >2% at 1 sigma were obtained but not simultaneously. Tradeoffs in choosing operating conditions for optimum poly-Si etch performance will be discussed.

6900 (CONF-911202–13) **An atom probe field ion microscope investigation of the role of boron in precipitates and at grain boundaries in NiAl.** Jayaram, R.; Miller, M.K. Oak Ridge National Lab., TN (United States). [1991]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Annual fall meeting of the Materials Research Society; Boston, MA (United States); 2-6 Dec 1991. Order Number DE92005102. Source: OSTI; NTIS; GPO Dep.

The high resolution analytical technique of Atom Probe Field Ion Microscopy (APFIM) has been used to characterize grain boundaries and the matrix of a stoichiometric NiAl alloy doped with 0.04 (100 wppm) and 0.12 at. % (300 wppm) boron. Field ion images revealed boron segregation to the grain boundaries. Atom probe elemental analysis of the grain boundaries measured a boron coverage of up to 30% of a monolayer. Extensive atom probe analyses also revealed a fine dispersion of nanoscale boride precipitates in the matrix. The boron segregation to the grain boundaries was found to correlate with the observed suppression of intergranular fracture. However, the decrease in ductility of boron-doped NiAl is attributed in part of the precipitation hardening effect of the boride phases.

6901 (CONF-911202-15) **Comparison of thermally- and irradiation-induced grain boundary segregation in austenitic stainless steels.** Kenik, E.A. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Annual fall meeting of the Materials Research Society; Boston, MA (United States); 2-6 Dec 1991. Order Number DE92005172. Source: OSTI; NTIS; GPO Dep.

Segregation at grain boundaries in austenitic stainless steels sensitized by either thermal annealing or irradiation was studied by analytical electron microscopy. Characterization of grain boundary compositions in both types of materials was performed by high spatial resolution ($\geq$ 2 nm) X-ray microanalysis. Whereas similar chromium depletion is observed in both processes, there are differences in the behavior of the other alloying elements and in the mechanisms responsible for the segregation. In thermal sensitization, the nickel/iron ratio and the silicon level observed at grain boundaries are similar to those for the matrix. In cases where little or no precipitation occurs, cosegregation of phosphorus, chromium, and molybdenum occurs at boundaries and interfaces. For radiation sensitization, radiation-induced segregation (RIS) results in enrichment of nickel, silicon, and, in certain cases, phosphorus and in depletion of iron at grain boundaries. There appears to be some synergism between segregation of nickel and silicon, which increases the magnitude of RIS effects. Grain boundary precipitation is often observed in both thermally- and irradiation-sensitized materials. However, the nature and origins of the two types of precipitation are different. The formation of chromium-enriched grain boundary carbides is the cause of the chromium depletion in thermal sensitization. In contrast, the precipitates produced by irradiation are enriched in nickel and silicon and depleted in chromium relative to the matrix and therefore are the result of RIS. Results for thermal- and radiation-induced segregation in manganese-stabilized austenites are compared to that for nickel-stabilized austenites.

6902 (DOE/ER/14135-T1) **An investigation of the effects of history dependent damage in time dependent fracture mechanics, Phase 1, constant load conditions: Progress report.** Brust, F.W.; Krishnaswamy, P.; Ghadiali, N.D. Battelle, Columbus, OH (United States). 14 Nov 1991. 51p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-90ER14135. Order Number DE92004428. Source: OSTI; NTIS; GPO Dep.

In the following section a brief review of constitutive models is presented along with the implications of using them in creep crack growth studies under variable loads. The model searched for this study, is discussed along with is special features that make is particularly suitable for this investigation. This model is based on the creep hardening surface and is particularly useful for variable and fully reversed load histories. In Section 3 an implicit finite element algorithm for this model is derived. Details regarding implementation of this method into FVP and existing FE program to study creep crack growth, are also discussed. The results of the algorithm are verified against closed form solutions for simple geometries in Section 4. Sources of error and differences between using explicit and implicit schemes are also presented. Section 5 compares the numerical results with experimental data for the case of combined tension and torsion and fully reversed load histories. Section 6 provides results of some of the constant load creep crack growth analyses that have been performed to date. Because a wealth of experimental data has been developed for creep crack under constant load conditions, the need to develop our own creep growth data for this study was minimal. Conclusions of the Phase 1 work as well as work planned for the future are discussed in Section 7. Finally, Sections 8 and 9 discuss publications and the Phase 2 effort, respectively. Finally, the implementation of large strain and friction/contact algorithms into the finite element code and the implementation of three additional non-linear constitutive laws and the Walker Model are not discussed here. The large strain algorithm is complete, the endochronic theory is nearly complete, while subroutines for the Bodner and Walker models were obtained from the agencies described above.

6903 (DOE/ER/45095-6) **[Vibrational and electronic properties of clusters and ultrathin films: Annual progress report].** Pennsylvania State Univ., University Park, PA (United States). [1991]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER45095. Order Number DE92005531. Source: OSTI; NTIS; GPO Dep.

Two areas have been focused on in the current period: clusters of Bi grown on surfaces and materials formed from buckyball (C60) clusters.

6904 (DOE/ER/45213-10) **FIM/atom probe study of grain boundaries in Ni_3Al.** Brenner, S.S. Pittsburgh Univ., PA (United States). Dept. of Materials Science and Engineering. [1991]. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER45213. (CONF-9109318-1: Department of Energy-Basic Energy Sciences (DOE-BES) workshop on scientific issues on intermetallic compounds: status and forecast for fundamental research, La Jolla, CA (United States), 11-14 Sep 1991). Order Number DE92004157. Source: OSTI; NTIS; GPO Dep.

Field-ion microscopy and atom probe microanalysis have been used to study grain boundaries in Ni_3Al to help clarify the mechanism by which boron ductilizes this material. Except for the Dartmouth material all of the ductile alloys were grain-refined by cold working and recrystallization at 800–900°C.

6905 (DOE/ER/45213-T2) **Microchemical analysis of intermetallic alloys using the field-ion microscope atom probe: Final report.** Brenner, S.S. Pittsburgh Univ., PA (United States). Dept. of Materials Science and Engineering. 1 Sep 1991. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER45213. Order Number DE92004020. Source: OSTI; NTIS; GPO Dep.

In this final report, we summarize the results of our studies on Ni(sub 3)Al and comment on the future use of field-ion microscopy techniques to elucidate the ductilization effect of boron.

6906 (DOE/ER/45239-7) **Atomic and electronic structure of metals and alloys: Clean surfaces and chemisorbed molecules: Progress report.** State Univ. of New York, Stony Brook, NY (United States). Research Foundation. 26 Nov 1991. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER45239. Order Number DE92005075. Source: OSTI; NTIS; GPO Dep.

The accomplishments of the work done under DOE sponsorship are summarized in the list of publications at the end of this narrative. Here we give a brief description of the nature and the significance of the accomplishments. The activity can be roughly subdivided into three parts: studies of surface alloys, studies of epitaxial ultra-thin films, and studies of electron band structure of metals. The list reflects the developments of particular areas of research and the phasing out of others as this was suggested by the interest in, and the success of, specific experimental projects.

6907 (DOE/ER/45308-5) **Novel concepts in weld metal science: Role of gradients and composite structure: Annual technical progress report, January 1, 1991–December 31, 1991.** Matlock, D.K.; Olson, D.L. Colorado School of Mines, Golden, CO (United States). Center for Welding and Joining Research. Dec 1991. 73p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER45308. Order Number DE92005082. Source: OSTI; NTIS; GPO Dep.

The effects of compositional and microstructural gradients on weld metal properties are being investigated. Crack propagation is solidified alloy structures is being characterized as to solidification orientation and the profile of the compositional variations. The effects of compositional gradients, are considered based on a thermodynamic analysis, referred to as the Cahn-Hillard analysis, which describes the degree to which a local surface energy is modified by the presence of a compositional gradient. The analysis predicts that both ductile and brittle fracture mechanisms are enhanced by the presence of a composition gradient. Special techniques to produce laboratory samples with microstructures which simulate the composition and microstructure gradients in solidified weld metal are used, along with appropriate mathematical models, to evaluate the properties of the composite weld metals. The composite modeling techniques are being applied to describe the effects of compositional and microstructural gradients on weld metal properties in Ni-Cu alloys. The development of metal matrix composition weld deposits on austenitic stainless steels has been studied. The particulate metal matrix composites were produced with ceramic or refractory metal powder filled cored wire, which was gas tungsten arc and gas metal arc welded.

6908 (DOE/ER/45310–35) **Grain boundaries: Progress report, February 15, 1991–October 15, 1991.** Balluffi, R.W.; Bristowe, P.D. Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Materials Science and Engineering. [1991]. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER45310. Order Number DE92004420. Source: OSTI; NTIS; GPO Dep.

The present document is a progress report describing the work accomplished to date during the second year of our four-year grant (February 15, 1990–February 14, 1994) to study grain boundaries. The research was focused on the following three major efforts: Study of the atomic structure of grain boundaries by means of x-ray diffraction, transmission electron microscopy and computer modeling; study of short-circuit diffusion along grain boundaries; and development of a Thin-film Deposition/Bonding Apparatus for the manufacture of high purity bicrystals.

6909 (DOE/ER/45387–T1) **Mechanical properties of materials with nanometer scale microstructures: Progress report, 1 April 1989 to Present.** Nix, W.D. Stanford Univ., CA (United States). Dept. of Materials Science and Engineering. Jul 1991. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-89ER45387. Order Number DE92004328. Source: OSTI; NTIS; GPO Dep.

For the past two years we have been engaged in a program of research on the mechanical properties of a variety of new materials with nanometer scale microstructures. These materials have been developed recently using vapor phase synthesis techniques and are available in the form of compositionally-modulated (multilayered) thin film materials and ultrafine-grained (nanocrystalline) solids. They have interesting microstructures and mechanical properties that may lead to new applications for these materials. In this report we give a brief summary of some of the results we have obtained to date in the course of this research. Other, more detailed, descriptions of some of this work can be found in the papers that we have published. These are listed at the end of this report along with a listing of the oral presentations we have given. We report briefly on our studies of the elastic properties of metallic multilayered thin films. Using indentation and microbeam deflection techniques, we have found that Au/Ni multilayers do not show supermodulus effects, contrary to some previous reports based on bulge test results. However, we have discovered large and significant substrate interaction stresses in these films which depend systematically on the composition modulation wavelength. We believe that these residual stresses may have led to bulge testing errors which in turn led to erroneous reports of supermodulus effects.

6910 (DOE/ER/75564–7) **Commercialization plan for Argonne's lubricious coatings.** Skackson, R.H. Industrial Technology Inst., Ann Arbor, MI (United States). 14 Mar 1991. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-90ER75564. Order Number DE92005086. Source: OSTI; NTIS; GPO Dep.

This report summarizes an interview conducted with Dr. David S. Grummon, a specialist in ion beam assisted deposition (IBAD) and coatings at Michigan State University, to define the concept and components of an ion beam assisted deposition (IBAD) system; summarizes findings of a literature search conducted to identify prior and current efforts in developing lubricious coatings; and reports on the market potential for Argonne's IBAD lubricious coating process.

6911 (DOE/NE/37963–17) **Deformation induced microstructural and microchemical changes during thermomechanical treatment: FY90 Annual progress report, Ocotber 1, 1989–September 30, 1990.** Atteridge, D.G. (Oregon Graduate Inst. of Science and Technology, Beaverton, OR (United States)); Murr, L.E.; Wood, W.E.; Bruemmer, S.M. Oregon Graduate Inst. of Science and Technology, Beaverton, OR (United States). [1990]. 150p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-86NE37963. Order Number DE92004394. Source: OSTI; NTIS; INIS; GPO Dep.

An important aspect of this program has been the continued study into: the effects of solution annealing (SA) on the subsequent susceptibility of the stainless steel (SS) material to grain boundary chromium depletion (GBCD); the effects of deformation on SA material and on the subsequent susceptibility of the deformed SS material to GBCD; the effects of deformation on isothermally induced GBCD in mill annealed (MA) and SA SS material; and, modeling the effects of deformation on isothermally induced GBCD in MA and SA SS material. An understanding of these subjects are academically important to this program as well as commercially important to the industrial community. This annual report presents an overview of programmatic research to data in these areas.

6912 (DOE/NE/37963–18) **Deformation induced microstructural and microchemical changes during thermomechanical treatment: FY 91 quarterly annual progress report, April 1, 1991–June 30, 1991.** Atteridge, D.G. (Oregon Graduate Inst. of Science and Technology, Beaverton, OR (United States)); Wood, W.E.; Bruemmer, S.M. Oregon Graduate Inst. of Science and Technology, Beaverton, OR (United States). [1991]. 31p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-86NE37963. Order Number DE92004392. Source: OSTI; NTIS; GPO Dep.

This quarter's effort has been directed towards development and assessment of the capability to predict sensitization development, in particular, sensitization development during continuous cooling. Model predictions are first compared to a continuous cooling (plus prestrain) data base developed under Nuclear Regulatory Commission funding. Parallel model development allowed prediction of weld thermal histories, assessment of weld induced sensitization, and prediction of weldment susceptibility to intergranular stress corrosion cracking (IGSCC). It has long been known that IGSCC of austenitic Type 300 Series stainless steels (SS) is directly related to the presence of grain boundary chromium depletion, and that this depletion, also called "sensitization", is caused by the formation of grain boundary chromium carbides/nitrides. Thus is is well documented that susceptibility to IGSCC is caused by a diffusion controlled process. However, quantification of this phenomena is still on active research area, and the research reported herein pertains to the development of a computer-based model capable of predicting IGSCC susceptibility in the heat affected zone (HAZ) of Type 304 and 316 SS girth pipe weldments. Model predictions are based on prediction of chromium depletion at grain boundaries. It is assumed that as grain boundary sensitization increases susceptibility to IGSCC increases. The model predicts levels of sensitization, with susceptibility to IGSCC estimated on a system by system assessment.

6913 (DOE/NE/37963–19) **Deformation induced microstructural and microchemical changes during thermomechanical treatment: Quarterly progress report, October 1, 1990–December 31, 1990.** Atteridge, D.G. (Oregon Graduate Inst. of Science and Technology, Beaverton, OR (United States)); Wood, W.E.; Bruemmer, S.M. Oregon Graduate Inst. of Science and Technology, Beaverton, OR (United States). [1990]. 21p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-86NE37963. Order Number DE92004399. Source: OSTI; NTIS; GPO Dep.

This quarter's effort has been directed towards development and assessment of the capability of predict sensitization development, in particular, sensitization development during continuous cooling. Model predictions are compared to a continuous cooling (plus prestrain) data base developed under Nuclear Regulatory Commission funding. It has long been known that intergranular stress corrosion cracking (IGSCC) of austenitic Type 300 Series stainless steels

(SS) is directly related to the presence of grain boundary chromium depletion, and that this depletion, also called "sensitization," is caused by the formation of grain boundary chromium carbides/nitrides. Thus it is well documented that susceptibility to IGSCC is caused by a diffusion controlled process. However, quantification of this phenomena is still an active research area, and the research reported herein pertains to the development of a computer-based model capable of predicting sensitization evolution as a function of thermo-mechanical history for Types 304 and 316 SS. The ultimate aim of this modeling effort is to be able to predict susceptibility to intergranular stress corrosion which is known to be related to degree of sensitization (DOS).

6914 (DOE/NE/37963–20) **Deformation induced microstructural and microchemical changes during thermomechanical treatment: Quarterly progress report, January 1, 1991–March 31, 1991.** Atteridge, D.G. 6915 (DOE/OR/00033–T460) **Ion beam enhanced adhesion of metal films to sapphire substrates.** Pawel, J.E. Vanderbilt Univ., Nashville, TN (United States). May 1991. 199p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-76OR00033 ;AC05-84OR21400. Order Number DE92004768. Source: OSTI; NTIS; GPO Dep.

The adhesion change of iron films to sapphire implanted with different ion species has been investigated. Because the chromium, iron, and nickel ions have nearly the same mass, slight adjustments in the accelerating voltage have ensured that the ion concentration profiles, cascade damage profiles, ionization damage profiles, recoil distributions, and sputtering are all very similar for each type of implantation. Adhesion processes dependent on these mechanisms should therefore be similar for the three ion species. The adhesion of the implanted films was measured quantitatively by a pull test and qualitatively by a scratch test. In every case, the adhesion was compared with that from as-deposited films. There is an adhesion increase with both iron and chromium implantation. No change was apparent after nickel implantation. 211 refs., 33 figs.,11 tabs.

6916 (ENEA-RT-NUCL–90-26) **Pd-H, Pd-D type system superconductivity.** Sacchetti, N. ENEA, Frascati (Italy). Area Nucleare. Sep 1991. 10p. (In Italian). (RT/NUCL–90-26). Order Number DE92744031. Source: OSTI; NTIS (US Sales Only).

In this review of a well known Pd-H, Pd-D type system phenomenon - even if pure palladium is not superconducting, the introduction of a suitable amount of H or D into the metal induces superconducting transition with a critical temperature of about 16 K in some cases, e.g., Pd-Cu-H - it is suggested that the theoretical interpretation implies that the superconducting state is connected to a strong reduction of the coulomb pseudo-potential in the interior of the system, with a consequent reduction of the coulomb interaction strength. It is also suggested that possible cold fusion processes could be made easier by very low temperatures.

6917 (INIS-BR–2868) **Investigation of the kinetics of γ-2 phase precipitation in highly cold worked FeCo-2%V.** Ferreira, P.I.; Couto, A.A. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). 1990 22p. (In Portuguese). Order Number DE92613395. Source: OSTI; NTIS (US Sales Only); INIS.

Cu-Zn-Al and Cu-Al-Ni alloys with shape memory effect were tested in matrix phase in many temperatures for obtaining couples of points. σA is the tension in which the matrix phase is induced to a new martensitic phase in the testing temperature. The σ x T diagram suggests a straight-line that in its interception with T axis furnishes the M_s temperature of the testing alloy, experimental values are compatibles with the ones in the literature and obtained by DSC. (author).

6923 (IS-M–672) **A non-contaminating method for preparing intra-rare-earth alloys containing volatile and non-volatile metals.** Beaudry, B.J.; Laabs, F.C. Ames Lab., IA (United States). [1991]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. (CONF-920305–1: Minerals, Metals, and Materials Society (TMS) annual meeting and exhibition, San Diego, CA (United States), 1-5 Mar 1992). Order Number DE92000524. Source: OSTI; NTIS; GPO Dep.

The preparation of alloys containing one to two percent of the volatile lanthanide metals Sm, Eu, Tm and Yb in the high melting point (HMP) rare earth metals Sc, Y and Lu was accomplished by a vapor deposition, diffusion method without crucible contamination. The method avoids the melting of the HMP metals which would introduce impurities from the crucible generally Ta or W. Plates of the HMP metals were hung from the lid in the upper part of the Ta crucible. The volatile metals were placed on the bottom and the lid welded in place under an atmosphere of helium. By proper selection of the alloying temperature, the effusion of the metal vapors through the helium atmosphere was slow enough to permit diffusion to occur and prevent refluxing of the newly formed alloy. Very volatile metals such as Mg required a Knudsen cells with a suitably size hole to prevent too rapid transfer of the low melting metal. Electron microprobe analysis of a cross-section of the HMP metals showed a homogeneous distribution of the volatile metals. The time and temperature required to obtain a homogeneous rare earth alloy without contamination are given. The use of the Knudsen cell to form magnesium-rare earth alloys is reviewed. 8 refs., 2 tabs.

6924 (IS-M–676) **Resistivity changes and grain growth with time at elevated temperatures of n-type $Si_{80}Ge_{20}$ with and without GaP and of p-type $Si_{80}Ge_{20}$ alloys.** Tschetter, M.J.; Beaudry, B.J. Ames Lab., IA (United States). 18 Oct 1991. 9p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-7405-ENG-82. (CONF-920104–22: 9. symposium on space nuclear power systems, Albuquerque, NM (United States), 13-16 Jan 1992). Order Number DE92004648. Source: OSTI; NTIS (US Sales Only); GPO Dep.

$Si_{80}Ge_{20}$ alloys containing GaP and P prepared for use in the modular isotopic thermoelectric generator (MOD-RTG) have been monitored continuously for resistivity changes at elevated temperatures for up to three years. Changes in resistivity with time due to dopant precipitation have been considerably slower at 400°C and 500°C than alloys without GaP added. At 600°C and above, changes in resistivity with time are higher in alloys with GaP. Changes in resistivity of p-type $Si_{80}Ge_{20}$ alloys at the same temperatures agree very well with those reported in the literature. Effects of GaP on grain growth of n-type Si-Ge alloys were also studied at heat treatment temperatures of 1050, 1100 and 1150°C.

6925 (IS-T–1566) **Strength, ultrasonic and metallurgical evaluation of diffusion bonds of dissimilar materials.** Ojard, G.C. Ames Lab., IA (United States). 20 Dec 1991. 150p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE92005095. Source: OSTI; NTIS; INIS; GPO Dep.

Diffusion bonding is a well known metallurgical joining technique which allows materials to be bonded together to near net shape. Diffusion bonds between dissimilar materials are of unique interest due to the complex interactions at the bond line. Previous experimental work has shown that the bond strength is dependent on the extent of interdiffusion between the two base materials. A systematic investigation of diffusion bonding between Cu and Ni was undertaken to study these effects and to find a means of evaluating the bond quality nondestructively. This system was chosen as it exhibits complete solid solubility which yields the simplest metallurgical system of diffusion bonds between dissimilar materials. A large body of work exists on modelling the kinetics of diffusion bonding between similar materials to predict the time for elimination of voids at the bond line. While most bonding conditions, for similar materials, follow the power law creep model, this is not the case for the Cu-Ni system studied. Ultrasonically, the challenge is to measure the extent and uniformity of the interdiffusion layer. Reflection coefficient measurements have been shown not to be sensitive enough to differentiate the samples. A total energy analysis has been shown to be able to differentiate the quality of the Cu-Ni diffusion bonds produced. Thus, this type of analysis appears to be a versatile NDE technique to monitor bond quality in diffusion bonds between dissimilar materials.

6926 (IS-T–1587) **Theoretical studies of amorphous silicon and hydrogenated amorphous silicon with molecular dynamics simulations.** Kwon, I. Ames Lab., IA (United States). 20 Dec 1991. 102p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE92005093. Source: OSTI; NTIS; GPO Dep.

Amorphous silicon (a-Si) and hydrogenated amorphous silicon (a-Si:H) have been studied with molecular dynamics simulations. The structural, vibrational, and electronic properties of these materials have been studied with computer-generated structural models and compare well with experimental observations. The stability of a-si and a-Si:H have been studied with the aim of understanding microscopic mechanisms underlying light-induced degradation in a-Si:H (the Staebler-Wronski effect). With a view to understanding thin film growth processes, a-Si films have been generated with molecular dynamics simulations by simulating the deposition of Si-clusters on a Si(111) substrate. A new two- and three-body interatomic potential for Si-H interactions has been developed. The structural properties of a-Si:H networks are in good agreement with experimental measurements. The presence of H atoms reduces strain and disorder relative to networks without H.

6927 (IS-T–1588) **Synthesis and characterization of nanocrystalline silicide compounds.** Karen, B. Ames Lab., IA (United States). 3 Jan 1992. 59p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE92005364. Source: OSTI; NTIS; GPO Dep.

This thesis involves the investigation into the production of nanocrystalline silicide compounds by radio frequency inductively coupled plasma (RF-ICP) and mechanical milling. A system constructed which utilized a RF-ICP, a powder feed system and a condensation /collection chamber to produce nanocrystalline materials. Several silicides, such as Ti_5Si_3, Cr_3Si and $MoSi_2$, were fed into the plasma were they vaporized. The vaporized material then passed into a connecting chamber, where it condensed out of the vapor phase and the resulting powder was collected. Much of the work conducted was in designing and building of the systems components. This was followed by establishing the plasmas operating parameters. The material collected from the ICP chamber was then compared to material produced by mechanical milling. The material produced by both methods were characterized by x-ray diffraction, scanning and transmission-electron microscopy, and energy dispersive spectroscopy. The results indicate that it is possible to produce nanocrystalline material by mechanical milling; however, there is a significant amount of contamination from the milling ball and milling container. The results also show that the Ti_5Si_3 and Cr_3Si compounds can be produced in nanocrystalline form by the ICP method. The resultant material collected from the ICP chamber following the $MoSi_2$ run consisted of nanocrystalline Si and crystalline, Mo rich Si compound. Inductively coupled plasma - atomic emission spectroscopy (ICP-AES) was also used to observe the powders as they passed through the plasma. The resulting data indicates that each compound was vaporized and dissociated in the plasma. The following thesis describes the apparatus and experimental procedure used in producing nanocrystals.

6928 (JAERI-M–91-116) **Effect of minor elements on hot workability of Ni-Cr-W superalloys.** Tsuji, Hirokazu (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Nakajima, Hajime; Shimizu, Tetsuya; Isobe, Susumu. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1991. 28p. (In Japanese). Order Number DE92750951. Source: OSTI; NTIS (US Sales Only); INIS.

Research and development have been carried out on the new Ni-Cr-W superalloys as a component material for HTGRs with coolant outlet temperatures of around 1000degC. The basic composition, Ni- 18 to 19 mass% Cr- 20 to 22 mass% W, of the experimental alloys was specified in the first step. Applying this new alloy to reactor components, the alloy with stable qualities should be supplied in an industrial scale. From such a viewpoint, the hot workability is one of the most important indices. Thus, in order to examine the effect of addition of Mn, Si, B, Y, Ti, etc. on the hot workability, a series of high-strain-rate high-temperature tension tests, so-called Gleeble tests, was carried out on 21 heats of Ni - 18 to 19 mass% Cr - 20 to 22 mass% W alloys at temperatures ranging from 800 to 1300degC at every 50degC for most of the heats, and also at 500, 600 and 700degC for the other heats. Based on the results obtained the following conclusions are drawn: (1) The addition of Mn and Si was extremely harmful to the hot workability. (2) The addition of B was effective to improve the hot workability. (3) The addition of Y was extremely effective to improve the hot workability. The saturation point of the effectiveness was higher than 0.008 mass%. (4) The addition of Ti was extremely effective to improve the hot workability. Around 0.08 mass% addition of Ti was enough to exhibit the effectiveness. (5) The addition of Nb, Fe and/or the enrichment of C exhibited no beneficial influence in the aspect of the hot workability substantially. (6) A new Ni-Cr-W superalloy, which shows extremely superior hot workability, has been developed. It will be possible that the new alloy is manufactured in an industrial scale. (author).

6929 (JAERI-M–91-132) **Hydrogen absorption by zirconium alloy cladding tube with surface oxide film.** Uchida, Masaaki (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1991. 37p. Order Number DE92750962. Source: OSTI; NTIS (US Sales Only); INIS.

Hydrogen absorption kinetics of Zircaloy (2 and 4) and Zr-Nb (1% and 2.5%) cladding tubes were studied by heating in hydrogen gas after oxide film formation in steam, oxygen or air. Hydrogen absorption rate depended on the degree of pre-oxidation. In Zr-Nb, the absorption rate was also sensitive to the atmosphere used for pre-oxidation, whereas in Zircaloy the rate was relatively independent of the kind of oxidant. In all materials, pre-oxidation to the transition point was found to bring about high absorption rate in the subsequent hydriding step. After pre-oxidation to the post-transition region, hydrogen absorption rate by Zircaloy showed constant or slightly decreasing tendency with increasing oxidation level, whereas in Zr-Nb, particularly in Zr-2.5%Nb, the rate showed a clearly decreasing tendency depending on the pre-oxidation atmosphere. Different characteristics of Zircaloy and Zr-Nb can partly be explained in terms of different valencies of alloying elements which influence the lattice defect concentrations in the oxide films. (author).

6930 (JAERI-M–91-136) **Effect of minor elements on corrosion behavior of Ni-Cr-W superalloys in HTGR helium.** Tsuji, Hirokazu (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Suzuki, Tomio; Tsukada, Takashi; Nakajima, Hajime. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1991. 50p. (In Japanese). Order Number DE92751006. Source: OSTI; NTIS (US Sales Only); INIS.

Research and development have been carried out on the new Ni-Cr-W superalloys as a component material for HTGRs with coolant outlet temperatures of around 1000degC. The basic composition, Ni-18 to 19 mass% Cr-20 to 22 mass% W, of the experimental alloys was specified in the first step. In order to examine the effect of addition of Mn, Si, B, Y and Ti on corrosion behavior in simulated HTGR helium, corrosion tests were carried out on eight heats of Ni-18 to 19 mass% Cr-20 to 22 mass% W alloys at 950 and 1000degC. Thermal cycles were given at intervals of 100h between room temperature and the each test temperature. The cumulative period of exposure to simulated HTGR helium at the each test temperature was 1000h. Based on the results obtained the following conclusions are drawn: (1) All the Ni-Cr-W alloys tested showed better resistance to general corrosion than Hastelloy XR, and also indicated better stability of the surface oxide film and less susceptibility to intergranular oxidation than the conventional Ni-Cr-W alloys. (2) The addition of Mn and Si showed no advantage. The alloys containing Mn and Si rather showed inferior corrosion resistance in simulated HTGR helium. (3) The addition of B and Y was effective to improve corrosion resistance in simulated HTGR helium. (4) Although the addition of Ti was harmful to corrosion resistance in simulated HTGR helium, around 0.08 mass% addition of Ti did not reduce corrosion resistance in the environment. (5) A new Ni-Cr-W superalloy, which shows extremely superior corrosion resistance to conventional Ni-Cr-W superalloys in simulated HTGR helium, has been developed. (author).

6931 (KAERI-II/RR–13/90) **Basic chemistry for radioactive waste management: Study on the corrosion of materials for radwaste containment.** Eom, Tae Yoon (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Jung, Ki Suk; Choi, In Kyu; Park, Su Gil; Yeon, Jei Won. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Mar 1991. 68p. (In Korean). Order Number DE92614822. Source: OSTI; NTIS (US Sales Only); INIS.

To study the mechanism of the corrosion process and to control the corrosion process in relation to the radwaste management, passive films on the metal surfaces and corrosion of iron, carbon steel, and titanium have been studied. Total charges for passivation, breakdown and repassivation process were measured and compared to understand the characteristics of passive films including the growth rate and the stability of the passive films. The bigger the charges for passivation process, the more metal dissolution and corrosion attack were observed. Increasing the concentration of chloride ions, the rate of coverage of exposed metal became slower and the stability of passive fimes were weakened. Corrosion measurements of iron, carbon steel, and titanium were performed. Iron and carbon steels were proven to become passivated in the carbonate media, but pitting corrosion occurred in the presence of chloride ions. From the impedance data, we conclude that an adsorptive reaction forming $Fe(OH)_2$ occurs in the dissolution of iron and carbon steel. In 0.1 M $NaHC0_3$ solution, iron and carbon steel showed a corrosion rate of 43-61 μm/yr and 18 μm/yr, respectively. In ground water, iron showed a corrosion rate of 5.8μm/yr and carbon steel showed an even smaller corrosion rate (0.27μm/yr). Titanium was passivated in an air-saturated 1 M KCl solution, but depassivated under N_2 saturated solution. However, titanium was passivated in 1 M KCl solution even under N_2 saturation. (Author).

6932 (KAERI/RR–949/90) **A study on the transportation of corrosion products in the steam generators.** Yang, Kyung Rin (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Koo, Je Hyeo; Lee, Eun Hee; Hong, Kwang Bum; Kang, Hee Suck. PC-based workstation consist of keithley model 500A data acquisition system and high sensitivity analog input module 3 is established for pwr secondary side on-line chemistry monitoring. asyst selected as software package is an integrated software system designed exclusively for scientific and engineering applications. (Author).

6933 (KAERI/RR–970/90) **Studies on the causes of failures in titanium tube condensers of nuclear power plants.** Kim, Uh Chul (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Joung Soo; Chung, Han Sub; Hwang, Seong Sik; Hur, Do Haeng. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1991. 70p. (In Korean). Order Number DE92614824. Source: OSTI; NTIS (US Sales Only); INIS.

The amount of hydrogen absorbed in Ti tubes varies as the surface condition of Ti tubes changes. It was observed that the amount of hydrogen absorbed in Ti tubes was highest in as-received and welded specimens, while that could be reduced by oxidizing them to make stable oxide surface film or by pickling them. The results of the experiments done by varing the applied cathodic potentials show that hydrogen content absorbed in Ti tubes increases very sharply at or below the potential of -0.9 V versus SCE, which suggests that critical potential for cathodic protection should be above -0.9 V versus SCE. (Author).

6934 (KAERI/RR–982/90) **A study on nuclear materials by neutron scattering.** Kim, Huhn Jun (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Yong Che; Chun, Byung Chil; Lee, Chang Hee; Lee, Jeong Soo; Seong, Baek Seok; Shim, Hae Seop; Choi, Byung Hoon; Ho, Jong Wha. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Mar 1991. 70p. (In Korean). Order Number DE92614815. Source: OSTI; NTIS (US Sales Only); INIS.

In order to verify the consistent analysis method of determining the anisotropic physical properties of hexagonal polycrystal materials from the texture which we established in 1989, angular dependent ultrasonic velocities were measured on a thin zircaloy-4 sheet, and compared with the estimations based on the texture measurements performed independently by the neutron diffraction. The relative variations of the experimental ultrasonic velocities of SHO (fundamental horizontally polarized shear mode) and SO (fundamental symmetric Lamb mode) waves in the rolling plane showed maximum 0.13% and 0.35% respectively with respect to the velocities in the rolling direction, suggesting very weak anisotropy and agreed well with the estimations obtained from the texture analysis. In a direct comparison of the elastic constant C66 available from absolute velocity measurement of SHO wave with the estimated value agreement was also retained within an error margin of 0.5%. KAERI has been proceeding with construction of 30 MW Korea Multipurpose Research Reactor(KMRR) with various design features. Therefore several preparatory works for neutron beam experiments and plans for the KMRR experimental facilities and neutron diffractometers have been done to the above continued study. The works include design and fabrication of the optimum coarse collimators for 4 standard beam tubes and 1 cold neutron one, and of the inpile collimator for neutron radiography. Mock-up testing of the rotating shutter and collimator, and its control system was done. (Author).

6935 (KCP–613-4508) **Potentiometric analysis of water soluble cutting fluid-metal combinations.** Kelley, E.E. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Dec 1991. 57p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. Order Number DE92004882. Source: OSTI; NTIS; GPO Dep.

The results of corrosion studies conducted by the University of Kansas under Contract G257763 for Allied-Signal Inc., Kansas City Division (KCD), are given. These potentiometric studies evaluate the corrosivity of two water soluble cutting fluids at varying concentrations on samples of 304 stainless steel, 6061-T6 aluminum, and beryllium copper. This testing serves two purposes: (1) to develop effective test procedures adaptable to existing KCD corrosion measurement equipment for corrosion analysis of cutting fluid-metals combinations, and (2) to understand the relative corrosiveness of the varying water soluble cutting fluids on different metals. The tests used were adapted from the American Society of Testing Materials (ASTM). Future testing will identify polarization techniques for establishing corrosion rates which will be used in evaluating both water soluble cutting fluids and other aqueous solutions used at KCD.

6936 (KFK–4861) **Investigations on the creep-rupture behaviour of the austenitic stainless steel AISI 316 NET. Final report.** Schirra, M. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung); Heger, S.; Ritter, B.; Rivas, M. de las; Chamero, A. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung. Aug 1991. 64p. (In German). Order Number DE92758916. Source: OSTI; NTIS (US Sales Only); INIS.

The report describes the creep-rupture tests carried out with a 17Cr-13Ni-2Mo-steel in the frame of the German-Spanish collaboration (KfK-CIEMAT). The material studied is the austenitic steel AISI 316(L) selected as potential first-wall material for NET (Next European Torus). The test program on base material with a NET specified batch comprises in the temperature range 500-750deg C the rupture-time-range till 40 000 h. The results permit statements on the creep- and creep-rupture behaviour and ductility. Metallographic examinations give informations about the fracture behaviour and demonstrate the complex precipitation behaviour. The results are compared with literature data and own results from two batches of the European Fast-Breeder-Program. (orig.).

6937 (LBL–30693) **HREM imaging of single unit cell carbide precipitates in Pt-C alloys.** Witcomb, M.J. (University of the Witwatersrand, Johannesburg (South Africa). Electron Microscope Unit); Dahmen, U.; O'Keefe, M.A.; Westmacott, K.H. Lawrence Berkeley Lab., CA (United States). Jul 1991. 2p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-910870–24: 49. Electron Microscopy Society of America (EMSA) annual meeting, San Jose, CA (United States), 4-9 Aug 1991). Order Number DE92004320. Source: OSTI; NTIS; GPO Dep.

Dilute Pt-C alloys are prototypical for studying oversize carbide phase precipitation from interstitial solid solution. Earlier studies showed the essential function of quenched-in vacancies in the precipitation process. Vacancies play a dual, volume accommodation and structural role in the transformation by modifying both the habit plane spacing and stacking sequence. It was also shown how the precipitation sequence in interstitial Pt-C alloys is analogous to that in substitutional Al-Cu alloys. Initially a "GP zone" consisting of a monolayer plate of carbon atoms and vacancies forms. Atomic resolution images of the so-called α precipitates have confirmed their structure. During subsequent coarsening of the precipitates, α' platelets form. The single-layer α structure, or GP zone is identical to a $\{100\}$ stacking fault stabilized by an intercalation of carbon. The two-layer α' structure is the first true precipitate phase and has a crystal structure anti-isomorphous with calcium fluoride. In the present contribution, simulated images based on this structure are compared with experimental images obtained at 800kV on the JEOL-1000 ARM. In addition to confirming the proposed precipitate structure, the results show the potential for successful imaging of precipitate structures containing light elements. 4 refs., 3 figs.

6938 (LBL–30729) **Control of texture during vapor deposition of Al on (111) Si.** Thangaraj, N. (Lawrence Berkeley Lab., CA (United States)); Westmacott, K.H.; Dahmen, U.; Reyes-Gasga, J. Lawrence Berkeley Lab., CA (United States). Apr 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-910406–39: Spring meeting of the Materials Research Society (MRS), Anaheim, CA (United States), 29 Apr - 3 may 1991). Order Number DE92004168. Source: OSTI; NTIS; GPO Dep.

The growth of Al on (111) Si single crystal substrates by various techniques usually leads to films with (111) texture, sometimes with a small (100) component. Using X-ray diffraction and electron microscopy, the present study shows that the (100) texture component can be enhanced to the point of forming an oriented (100) continuous tricrystal structure. The formation of this texture is shown to be related the presence of Cu. It is concluded that an understanding of heteroepitaxy must take into account the effect of chemistry in addition to the crystallographic criteria of lattice matching.

6939 **Solder extrusion pressure bonding process and bonded products produced thereby.** Beavis, L.C.; Karnowsky, M.M.; Yost, F.G. To Dept. of Energy. 1990. Filed date 20 Apr 1990. USA Patent patent application 7-511,684. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004603. Source: OSTI; NTIS; GPO Dep.

Production of soldiered joints which are highly reliable and capable of surviving 10,000 thermal cycles between about −40°C and 110°C. Process involves interposing a thin layer of a metal solder composition between the metal surfaces of members to be bonded and applying heat and up to about 1000 psi compression pressure to the superposed members, in the presence of a reducing atmosphere, to extrude the major amount of the solder composition, contaminants including fluxing gases and air, from between the members being bonded, to form a very thin, strong intermetallic bonding layer having a thermal expansion tolerant with that of the bonded members.

6940 **A method for joining ceramic shapes.** Rabin, B.H. To Dept. of Energy. 1990. Filed date 26 Jun 1990. USA Patent patent application 7-543,897. 15p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE92003815. Source: OSTI; NTIS; GPO Dep.

The invention is a method for joining shapes of ceramic materials together to form a unitary ceramic structure. In the method of the invention, a mixture of two or more chemical components which will react exothermically is placed between the surfaces to be joined, and the joined shapes heated to a temperature sufficient to initiate the exothermic reaction forming a joining material which acts to bond the shapes together. Reaction materials are chosen which will react exothermically at temperatures below the degradation temperature of the materials to be joined. The process is particularly suited for joining composite materials of the silicon carbide-silicon carbide fiber type.

6941 **Electrochemical polishing of thread fastener test specimens of nickel-chromium iron alloys.** Kephart, A.R. To Dept. of Energy. 1990. Filed date 3 Jul 1990. USA Patent patent application 7-547,370. 17p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC12-76SN00052. Order Number DE92003818. Source: OSTI; NTIS; GPO Dep.

An electrochemical polishing device and method for selective anodic dissolution of the surface of the test specimens comprised, for example, of nickel-chromium-iron alloys, which provides for uniform dissolution at the localized sites to remove metal through the use of a coiled wire electrode (cathode) placed in the immediate proximity of the working, surface resulting in a polished and uniform grain boundary.

6942 (PNL-SA-19782) **Crack-tip chemistry modeling of stage I stress corrosion cracking.** Jones, R.H.; Simonen, E.P. Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-9110311-1: Parkins symposium on fundamentals, Cincinnati, OH (United States), 20-24 Oct 1991). Order Number DE92004515. Source: OSTI; NTIS; INIS; GPO Dep.

Stage I stress corrosion cracking usually exhibits a very strong K dependence with Paris law exponents of up to 30. 2 Model calculations indicate that the crack velocity in this regime is controlled by transport through a salt film and that the K dependence results from crack opening controlled salt film dissolution. An ionic transport model that accounts for both electromigration through the resistive salt film and Fickian diffusion through the aqueous solution was used for these predictions. Predicted crack growth rates are in excellent agreement with measured values for Ni with P segregated to the grain boundaries and tested in IN H_2SO_4 at +900 mV. This salt film dissolution may be applicable to stage I cracking of other materials.

6943 (PNL-SA-20244) **Sensitization and IGSCC susceptibility prediction in stainless steel pipe weldments.** Atteridge, D.G. (Oregon Graduate Inst. of Science and Technology, Beaverton, OR (United States)); Simmons, J.W.; Li, Ming; Bruemmer, S.M. Pacific Northwest Lab., Richland, WA (United States). Nov 1991. 27p. Sponsored by U.S. DOE Nuclear Energy; Nuclear Regulatory Commission. DOE Contract AC06-76RL01830. (CONF-911179-2: Life prediction of corrodible structures, Kauai, HI (United States), 5-8 Nov 1991). Order Number DE92004509. Source: OSTI; NTIS; INIS; GPO Dep.

An analytical model, based on prediction of chromium depletion, has been developed for predicting thermomechanical effects on austenitic stainless steel intergranular stress corrosion cracking (IGSCC) susceptibility. Model development and validation is based on sensitization development analysis of over 30 Type 316 and 304 stainless steel heats. The data base included analysis of deformation effects on resultant sensitization development. Continuous Cooling sensitization behavior is examined and modelled with and without strain. Gas tungsten are (GTA) girth pipe weldments are also characterized by experimental measurements of heat affected zone (HAZ) temperatures, strains and sensitization during/after each pass; pass by pass thermal histories are also predicted. The model is then used to assess pipe chemistry changes on IGSCC resistance.

6944 (SAND-91-0679C) **Dynamic material properties of refractory materials: Molybdenum.** Furnish, M.D.; Chhabildas, L.C. Sandia National Labs., Albuquerque, NM (United States). [1991]. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-911003-21: Fall meeting of the Minerals, Metals and Materials Society of AIME and Materials Week of the American Society of Metals, Cincinnati, OH (United States), 20-24 Oct 1991). Order Number DE92003577. Source: OSTI; NTIS; GPO Dep.

Recently, techniques have been developed to determine dynamic material properties of refractory metals at strain rates of 10^5 to 10^{10} sec^{-1} and to stresses approaching 250 GPa. Similar techniques have been used to measure the dynamic properties of molybdenum; results are summarized in this paper. These experiments have allowed the determination of pressure and loading rate effects on the dynamic yield strength of molybdenum and its viscoelastic properties, as well as a determination of the Hugoniot, at relatively low stresses. Several combinations of loading and reloading and loading and unloading cycles have been employed, utilizing a compressed gas gun and VISAR diagnostics. Pressure ranges from 6.5 to 15 GPa were investigated with specimen thicknesses ranging from 1.5 to 13 mm. The Hugoniot is consistent with earlier observations at higher pressures. The Hugoniot elastic limit appears to decrease slightly with distance over the stress range reported in this study, although the decrease is of the same order as the uncertainties. Otherwise, waves are observed to be steady. Strengths at the HEL and the Hugoniot state, approximately 1.5 GPa, are within the range observed for lower strain rates of 10^{-3} sec^{-1} to $5 \cdot 10^3$ sec^{-1}, consistent with a thermal activation slip model applicable across a wide range of strain rates. Strain rate behaves as approximately as the fourth power of stress, although it appears to decrease with propagation distance over the specimen thickness range used. 15 refs., 8 figs., 2 tabs.

6945 (SAND-91-1732) **An investigation of gouge initiation in high-velocity sliding contact.** Tachau, R.D.M. Sandia National Labs., Albuquerque, NM (United States). Nov 1991. 125p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92003944. Source: OSTI; NTIS; GPO Dep.

Surface damage has been observed on the rails of rocket sled tracks and on the barrels of high-velocity guns. The phenomenon is generally referred to as "ongoing". Damage to a stationary surface (guider) is created from the oblique impact of a high-velocity object (slider) moving over its surface. The surface damage (gouge) is typically a shallow crater in the shape of a teardrop with the leading edge characterized by the wider end and a slightly raised lip. For rocket sleds, rail gouging occurs when the sled velocity is greater than 1.5 km/sec; while in guns, barrel gouging occurs when the velocity exceeds 4 km/sec. A model is developed to describe the phenomenon of gouging. An unbalanced slider randomly causes a shallow-angle, oblique impact between the slider and the guider. At sufficiently high velocity, the impact produces a thin, but very hot, layer of soft material at the contact surface. Under the action of a moving load, the soft layer lends itself to an antisymmetric deformation and a gouge is formed when this soft material is over-run by the slider. The model is simulated numerically with a hydrodynamic (CTH) code. The results of the simulations are in good agreement with the observed phenomena. Based on the simulated temperature and pressure profiles at the contact surface, design criteria for gouge mitigation are developed in this study. 45 refs., 29 figs., 1 tab.

6946 (SAND-91-2263C) **Selective deposition of copper on poly(tetrafluoroethylene).** Rye, R.R. (Sandia National Labs., Albuquerque, NM (United States)); Chi, K.M.; Hampden-Smith, M.; Kodas, T.T. Sandia National Labs., Albuquerque, NM (United States). [1991]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9110301-1: Advanced metallization for ULSI applications conference, Newark, NJ (United States), 7-19 Oct 1991). Order Number DE92003949. Source: OSTI; NTIS; GPO Dep.

An additive three step process has been developed for patterned deposition of Cu onto poly(tetrafluoroethylene) (PTFE). The first step involves patterned irradiation with X-rays or electrons which is thought to cross link the PTFE surface; step two involves chemical etching with the result that only the non-irradiated areas are etched; and step three involves selective chemical vapor deposition (CVD) of Cu onto the etched surface at 200 C using (hexafluoroacetylacetonato)Cu(I) trimethylphosphine ((hfac)Cu(PMe_3)). The non-irradiated areas of the surface are covered by a continuous, dense Cu film with X-ray photoelectron spectra show to contain only surface impurities that are easily removed by a short Ar ion sputter. The irradiated areas show the presence of only C and F, characteristic of PTFE.

6947 (SAND–91-2399C) **A comparison of Whipple shield hypervelocity impact tests to penetration predictors.** Hill, S.A. (National Aeronautics and Space Administration, Huntsville, AL (United States). Marshall Space Flight Center, Structures Division); Chhabildas, L.C.; Hertel, E.S. Sandia National Labs., Albuquerque, NM (United States). [1991]. 4p. Sponsored by U.S. DOE Defense Programs; National Aeronautics and Space Administration. DOE Contract AC04-76DP00789. (CONF-9110217–6: 42. International Aeronautical Federation Congress (IAEFC), Montreal (Canada), 7-11 Oct 1991). Order Number DE92004740. Source: OSTI; NTIS; GPO Dep.

The purpose of this paper is to develop an analytical model to convert ballistic limit curves obtained from flat projectile experiments to ballistic limit curves based on equivalent diameter spheres. Results from a test program involving flat plat projectiles conducted at Sandia National Laboratories are compared against the predicted performance of equivalent spherical projectiles as determined from the Wilkinson and Cour-Palais penetration equations. The developed method demonstrates good correlation of the ballistic limit of the shield concept for the flat plate projectiles to the theoretical ballistic limit for equivalent spheres as predicted by the penetration equations. 3 refs.

6948 (SAND–91-2533C) **Alloy design options for improvement of the thermomechanical fatigue life of solder joints.** Frear, D.R. (Sandia National Labs., Albuquerque, NM (United States)); Jones, W.B.; Morris, J.W. Jr.; Mei, Z. Sandia National Labs., Albuquerque, NM (United States). [1991]. 32p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789 ;AC03-76SF00098. (CONF-911213–20: American Society of Mechanical Engineers (ASME) annual winter meeting, Atlanta, GA (United States), 1-6 Dec 1991). Order Number DE92003954. Source: OSTI; NTIS; GPO Dep.

In this paper we discuss alloy development options to improve the thermomechanical fatigue behavior of eutectic Sn-Pb solder joints. Eutectic Sn-Pb solder joins fail through the development of a heterogeneous coarsened band of recrystallized and coarsened Pb- and Sn-rich phases. Imposed deformation concentrates solely into this thin region, accelerating fatigue failures. To address this problem, solder alloys are currently being developed which improve the fatigue characteristics of eutectic Sn-Pb solder. New alloys must retain wetting and manufacturability characteristics similar to eutectic Sn-Pb in addition to improving fatigue durability. The options we present to improve fatigue life include: creating a fine superplastic microstructure, homogenizing the microstructure with small alloy additions, reinforcing the solder with a carbon composite structure, using dispersed second phase precipitates that break up the solder microstructure, and using replacement alloys for eutectic Sn-Pb.

6949 (SAND–91-2606C) **Fluxless laser soldering for electronic packaging.** Hosking, F.M.; Keicher, D.M. Sandia National Labs., Albuquerque, NM (United States). [1991]. 11p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC04-76DP00789. (CONF-920247–1: National electronics products conference (NEPCON) west, Anaheim, CA (United States), 23-27 Feb 1992). Order Number DE92003958. Source: OSTI; NTIS; GPO Dep.

Conventional soldering typically requires the use of reactive fluxes to promote wetting. The resulting flux residues are removed primarily with halogenated or chlorofluorocarbon (CFC) solvents. With the mandated phaseout of CFCs by the year 2000, there has been a concentrated effort to develop alternative, environmentally compatible manufacturing and cleaning technologies that will satisfy the restrictions placed on CFCs, but still yield high quality product. Sandia National Laboratories is currently evaluating a variety of alternative fluxless soldering technologies which can be applied to electronic packaging. Laser soldering in a controlled atmosphere has shown great potential as an environmentally compatible process. The effects of laser heating with a 100 watt CW Nd:YAG laser, joint design, and base/filler metal reactions on achieving fluxless wetting with good metallurgical bonds were examined. Satisfactory Ni-Au plated Kovar® solder joints were made with 80In-15Pb-5Ag and 63Sn-37Pb (wt. %) solder alloys in a slightly reducing cover gas. Wetting generally increased with increasing laser power, decreasing laser beam spot size, and decreasing part travel speed. The materials and processing interaction effects are identified and discussed.

6950 (SAND–91-2661C) **Analysis of ultrasonic tinning.** Vianco, P.T.; Hosking, F.M. Sandia National Labs., Albuquerque, NM (United States). 22 Nov 1991. 15p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC04-76DP00789. (CONF-920247–2: National electronics products conference (NEPCON) west, Anaheim, CA (United States), 23-27 Feb 1992). Order Number DE92003948. Source: OSTI; NTIS; GPO Dep.

This report describes experiments conducted as part of the initial phase in which the wettability of tin on oxygen-free, high conductivity (OFHC) copper was examined using a "point source" ultrasonic horn.

6951 (SAND–91-2752C) **Wettability analysis of tin-based, lead free solders.** Vianco, P.T.; Hosking, F.M.; Rejent, J.A. Sandia National Labs., Albuquerque, NM (United States). [1992]. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-920247–3: National electronics products conference (NEPCON) west, Anaheim, CA (United States), 23-27 Feb 1992). Order Number DE92004397. Source: OSTI; NTIS; GPO Dep.

The overall program is comprised of two efforts. The first effort studies the wettability of tin-based, lead free solders on two commonly used substrate materials: copper and gold-nickel plated Kovar™. The evaluation is being conducted by the meniscometer/wetting balance technique which uses the contact angle as the primary metric to quantify wettability. Information about the rate of wetting is also obtainable with this test. The second part of the program is comprised of an assessment of the solderability of actual circuit board assemblies (surface mount and through-hole). This report will describe data from the wettability analysis of lead free solders on copper.

6952 (UCRL–53868-90, pp. 4.1-4.8) **Molecular dynamics modeling of indentation and cutting.** Hoover, W.G. (Univ. of California, Davis (United States)); Belak, J.F.; DeGroot, A.J.; Hoover, C.G.; Stowers, I.F. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors are modeling precision machining processes on an atomic scale by combining molecular dynamics simulation methods with the speed and power of new, massively parallel computers. By simulating the response of every atom in a material, they can obtain much more information that can be gathered through continuum simulations and macroscopic measurements. Their two-dimensional workpiece simulations contain more than a million atoms, and accurately predict the behavior of simple metals.

6953 (UCRL–53868-90, pp. 5.1-5.5) **Superplasticity in intermetallic compounds and structural ceramics.** Dalder, E.N.C. (Lawrence Livermore National Lab., CA (United States)); Hiromoto, D.; Cadwell, K.; Mukherjee, A.K.; Jin, P.; Yang, H.; Sakuma, T. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

A better understanding of how intermetallic compounds and ceramics deform superplastically could lead to advanced fabrication processes for producing structural components of these materials to near-net shape. Successful development of such manufacturing processes could lead to widespread use of these materials in severe high-temperature environments. The objectives of this study are (1) to develop a better understanding of the mechanisms of superplastic behavior in a selected intermetallic compound and selected high-temperature ceramics, and (2) to assess how knowledge of these mechanisms could lead to development of advanced manufacturing techniques for these materials.

6954 (UCRL–53868-90, pp. 5.22-5.27) **Modeling superplastic materials.** Lesuer, D.R.; Syn, C.; Cadwell, K.; Mance, S. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors are developing a model to account for the effects of microstructural evolution, including strain-enhanced grain growth and cavitation, on stress-strain behavior and deformation localization, which affect the superplastic behavior of materials. They are also assessing the abilities of two rate-dependent constitutive laws to predict stress-strain behavior when the kinetics of microstructural evolution are considered.

6955 (UCRL–53868-90, pp. 5.28-5.34) **Modeling and experimental measurement of residual stress.** Flower, E.C. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The accurate, absolute, and nondestructive measurement of residual stress fields within metallic, ceramic, and composite engineering components is a major problem facing engineers. The author's objective has been to determine residual stress through finite-element modeling and with reliable experimental methods. He has previously demonstrated his ability to calculate with the finite-element method and experimentally measure deformation-induced residual stress with neutrons and x rays and by mechanical and ultrasonic techniques. He has concluded that diffraction is the preferred experimental method and that neutron or high-energy radiation can be used to determine residual stress in the bulk or volume of the specimen. Neutron-diffraction experiments were made at the Chalk River Nuclear Laboratory with thermal neutrons on a stainless steel ring specimen and a Zircaloy-2 bent-beam specimen. In October 1990, his stainless steel ring was used in experiments carried out at the Manuel Lujan, Jr. (Los Alamos) Neutron Scattering Center to demonstrate the first use of a pulsed neutron source to make spatially resolved measurements of residual stress. Previously, in March 1989, he carried out experiments at the Stanford Synchrotron Radiation Laboratory, using synchrotron radiation, an intense, highly focused, x-ray tunable radiation source with a wide range of available energies. These experiments were also a first-demonstration using this diffraction source. In collaboration with researchers at the University of California, Berkeley, he successfully demonstrated an ultrasonic method to determine residual stress using longitudinal waves. With researchers at the University of California, Davis, he designed, analyzed, and constructed a prototype triaxial residual stress measurement system that uses high-energy x-ray diffraction.

6956 (UCRL-ID–108330) **Survey of degradation modes of four nickel-chromium-molybdenum alloys.** Gdowski, G.E. (KMI Energy Services, Livermore, CA (United States)). Lawrence Livermore National Lab., CA (United States). Mar 1991. 67p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-48. Order Number DE92004469. Source: OSTI; NTIS; INIS; GPO Dep.

This report examines the degradation modes of four Ni-Cr-Mo alloys under conditions relevant to the Yucca Mountain Site Characterization Project (YMP). The materials considered are Alloys C-276, C-4, C-22, and 625 because they have desirable characteristics for the conceptual design (CD) of the high-level radioactive-waste containers presented in the YMP Site Characterization Plan (SCP). The types of degradation covered in this report are general corrosion; localized corrosion, including pitting and crevice corrosion; stress corrosion cracking in chloride environments; hydrogen embrittlement (HE); and undesirable phase transformations due to a lack of phase stability. Topics not specifically addressed are welding concerns and microbiological corrosion. The four Ni-Cr-Mo alloys have excellent corrosion resistance in chloride environments such as seawater as well as in more aggressive environments. They have significantly better corrosion resistance than the six materials considered for the CD waste container in the YMP SCP. (Those six materials are Types 304L and 3161L stainless steels, Alloy 825, unalloyed copper, Cu(70)-Ni(30), and 7% aluminum bronze.) In seawater, the Ni-Cr-Mo alloys have negligible general corrosion rates and show little evidence of localized corrosion. The four base materials of these alloys are expected to have nearly indistinguishable corrosion resistance in the YMP environments. The strength requirements of the SCP-CD waste container are met by these materials in the annealed condition; in this condition, they are highly resistant to HE. Historically, HE has been noted when these materials have been strengthened (cold-worked) and used in sour gas (H_2S and CO_2) well service – conditions that are not expected for the YMP. Metallurgical phase stability may be a concern under conditions favoring (1) the formation of intermetallics and carbides, and (2) microstructural ordering.

6957 (ZfK–743) **Investigation of high temperature water steam oxidation of ZrNb1.** Boehmert, J. (Zentralinstitut fuer Kernforschung, Rossendorf (Germany)); Linek, J.; Dietrich, M. Zentralinstitut fuer Kernforschung, Rossendorf (Germany). May 1991. 62p. (In German). Order Number DE92758946. Source: OSTI; NTIS (US Sales Only); INIS.

The oxidation behaviour of ZrNb was investigated in the temperature range of 700-1200deg C in water steam atmosphere. Some experiments was carried out with Zircaloy test specimens for comparing. The kinetics of oxidation and weight gain are similar for both materials. There are evident differences in the structure of the oxide scale and of the O-stabilized alpha layer. Also the oxygen distribution within the metal and the solubility of oxygen from each other differ. This leads to a rapid reduction of room-temperature ductility of ZrNb material. A statistical analysis demonstrates, that the experimental results can be described by the kinetic equations developed by Vrtilkova et al. These equations are also applicable to transient oxidation conditions. (orig.).

Argonne National Lab., IL (United States). Apr 1991. 32p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. (CONF-911213–19: American Society of Mechanical Engineers (ASME) annual winter meeting, Atlanta, GA (United States), 1-6 Dec 1991). Order Number DE92004149. Source: OSTI; NTIS; GPO Dep.

Plastic extrusion is a promising method for producing the long lengths of high-$T_c$superconductor that will be necessary to meet many potential applications. A crucial phase of the extrusion method is removal of organic constituents. Incomplete removal can leave residual carbon at grain boundaries, which can adversely affect the superconducting properties, whereas excessively rapid removal of the organics can cause the extruded superconductor to disintegrate completely. In this paper, we analyze the effects of the following aspects of organics removal, as they apply to the firing of extruded $YBa_2Cu_3O_x$ coils: (1) total pressure in the furnace, (2) oxygen flow, (3) heat conduction, and (4) diffusion of volatile components during removal of organics.

It is proposed that the transport critical current (J_c) density for high-$T_c$thin films, bicrystals, and bulk ceramics is determined by magnetic field penetration into the grain boundaries; the grain orientation may not in all cases be an important factor. The parameter $(\lambda_L/\lambda_J)^2$ can characterize the strength of the grain boundary coupling, which depends mainly on the crystal coherence and the structure of the boundary.

Changes induced by 1.5 MeV Kr ion irradiation of both U_3Si and U_3Si_2 have been followed by in situ transmission electron microscopy. When irradiated at sufficiently low temperatures, both alloys transform from the crystalline to the amorphous state. When irradiated at temperatures above the temperature limit for ion beam amorphization, both compounds disorder with the Martensite twin structure in U_3Si disappearing from view in TEM. Prolonged irradiation of the disordered crystalline phases results in nucleation of small crystallites within the initially large crystal grains. The new crystallites increase in number during continued irradiation until a fine grain structure is formed. Electron diffraction yields a powder-like diffraction pattern that indicates a random alignment of the small crystallites. During a second irradiation at lower temperatures, the small crystallizes retard amorphization. After 2 dpa at high temperatures, the amorphization dose is increased by over twenty times compared to that of initially unirradiated material.

6961 (ANL/CP–74636) **Flux pinning behavior in twin boundaries of single crystal $YBa_2Cu_3O_{7-\delta}$.** Kwok, W.K.; Fleshler, S.; Welp, U.; Vinokur, V.M.; Downey, J.; Crabtree, G.W. Argonne National Lab., IL (United States). Oct 1991. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-911096–4: 4. international symposium on superconductivity, Tokyo (Japan), 14-17 Oct 1991). Order Number DE92004124. Source: OSTI; NTIS; INIS; GPO Dep.

We present magnetoresistance measurements up to H = 6 Tesla using a crossed magnetic field technique to demonstrate pinning by twin boundaries (TB) in $YBa_2Cu_3O_{7-\delta}$. We investigate geometries for H || c || TB, H || ab || TB and for H rotated within a twin boundary plane. We find the critical angle Θ^* for TB pinning to be field dependent and field independent for H || c || TB and H || ab || TB respectively in fields up to 6 Tesla and temperatures near T_c. In addition, we report on the full phase diagram for the onset of TB pinning. The TB pinning onset temperature coincides with the "shoulder" feature observed in the resistive transition in magnetic fields in these crystals.

6962 (ANL/CP–74692) **Flux motion and dissipation in high-temperature superconductors.** Gray, K.E.; Kim, D.H. Argonne National Lab., IL (United States). Aug 1991. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9108140–2: Phenomenology and applications of high temperature superconductivity, Los Alamos, NM (United States), 22-24 Aug 1991). Order Number DE92004141. Source: OSTI; NTIS; INIS; GPO Dep.

The effects on flux motion and dissipation of interlayer coupling of the Cu-O planes along the c-axis are considered for the high-temperature superconductors (HTS). It is argued that for the highly-anisotropic HTS, the weak interlayer coupling plays a dominant role that can be described by incoherent Josephson tunneling between superconducting Cu-O bi- or tri-layers. In $YBa_2Cu_3O_7$, the layers are strongly coupled, presumably because the conducting Cu-O chains short circuit the Josephson tunneling, so that these effects are weak or missing.

6963 (ANL/CP–74820) **Tunneling in cuprate and bismuthate superconductors.** Zasadzinski, J.F. (Illinois Inst. of Tech., Chicago, IL (United States). Dept. of Physics); Huang, Qiang; Tralshawala, N.; Gray, K.E. Argonne National Lab., IL (United States). Oct 1991. 12p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract W-31109-ENG-38. Grant DMR-8809854. (CONF-9109102–4: 5. annual conference on superconductivity and applications, Buffalo, NY (United States), 24-26 Sep 1991). Order Number DE92004135. Source: OSTI; NTIS; INIS; GPO Dep.

Tunneling measurements using a point-contact technique are reported for the following high temperature superconducting oxides: $Ba_{1-x}K_xBiO_3$(BKBO), $Nd_{2-x}Ce_xCuO_4$(NCCO), $Bi_2Sr_2CaCu_2O_7$(BSCCO) and $Tl_2Ba_2CaCu_2O_x$ (TBCCO). For the bismuthate, BKBO, ideal, S-I-N tunneling characteristics are observed using a Au tip. The normalized conductance is fitted to a BCS density of states and thermal smearing only proving there is no fundamental limitation in BKBO for device applications. For the cuprates, the normalized conductance displays BCS-like characteristics, but with a broadening larger than from thermal smearing. Energy gap values are presented for each material. For BKBO and NCCO the Eliashberg functions, $\alpha^2F(\omega)$, obtained from the tunneling are shown to be in good agreement with neutron scattering results. Proximity effect tunneling studies are reported for Au/BSCCO bilayers and show that the energy gap of BSCCO can be observed through Au layers up to 600 Å thick.

6964 (ANL/CP–74977) **Synthesis of c-oriented $YbBa_2Cu_3O_{7-\delta}$ films on single and polycrystalline substrates by oxidation of liquid alloys.** Luo, J.S. (Argonne National Lab., IL (United States)); Merchant, N.; Maroni, V.A.; Gruen, D.M.; Tani, B.S.; Sandhage, K.H.; Craven, C.A. Argonne National Lab., IL (United States). Nov 1991. 7p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract W-31109-ENG-38. (CONF-911202–20: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92005189. Source: OSTI; NTIS; INIS; GPO Dep.

Textured superconducting films of $YbBa_2Cu_3O_{7-\delta}$ supported on single and polycrystalline substrates were prepared by oxidation of a liquid precursor alloy. The substrates were coated by dipping them into a molten alloy ($YbBa_2Cu_3$, m.p. ~870°C), withdrawing them from the melt, then oxidizing the adhering liquid alloy layer to the corresponding oxide phase, i.e., $YbBa_2Cu_3O_{7-\delta}$. Samples prepared in this way exhibited a superconducting transition at ~80 K following annealing in pure OP_2 at 500°C. With $SrTiO_3$ (100) and MgO (100) substrates, evidence was seen for the epitaxial growth of $YbBa_2Cu_3O_{7-\delta}$ crystals having their c-axis parallel to the [100] direction of the substrate. For polycrystalline MgO, x-ray diffraction and microstructural examination showed that the high-$T_c$crystallites in the films were also oriented with their c-axis perpendicular to the substrate surface, but the a and b axes directions were randomly oriented rather than epitaxial.

6965 (BNL–46855) **A method of producing high quality oxide and related films on surfaces.** Ruckman, M.W. (Brookhaven National Lab., Upton, NY (United States)); Strongin, M.; Gao, Yongli. Brookhaven National Lab., Upton, NY (United States). [1991]. 12p. Sponsored by U.S. DOE Energy Research; A.P. Sloan Foundation. DOE Contract AC02-76CH00016. (CONF-911231–4: Technology 2001, San Jose, CA (United States), 3-5 Dec 1991). Order Number DE92005048. Source: OSTI; NTIS; GPO Dep.

Aluminum oxide or aluminum nitride films were deposited on MBE grown GaAs(100) using a novel cryogenic-based reactive thin film deposition technique. The process involves the condensation of molecular oxygen, ammonia or other gases normally used for reactive thin film deposition on the substrate before the metal is deposited. The metal vapor is deposited into this layer and reacts with the molecular solid form the desired compound or a precursor than can be thermally decomposed to generate the desired compound. The films produced by this method are free of impurities and the low temperatures can be used to control the film and interfacial structure. The process can be easily integrated with existing MBE-systems and on going research using the same apparatus suggests than photon or electron irradiation could also be used to promote the reactions needed to give the intended material.

6966 (CONF-910908–2) **Microwave sintered silicon nitride ceramics.** Tiegs, T.N.; Kiggans, J.O.; Menchhofer, P.A. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From 2. conference of the European Ceramic Society; Augsburg (Germany); 11-14 Sep 1991. Order Number DE92004405. Source: OSTI; NTIS; GPO Dep.

Silicon nitride-based materials are processed using a variety of thermal heating techniques and procedures, such as sintering, reaction-bonding, and annealing. For sintering, typical silicon nitride processing starts with high α-phase Si_3N_4 powders mixed with sintering aids, such as MgO, Y_2O_3, and Al_2O_3. After consolidation of the mixtures into a shape, they are heated in a nitrogen atmosphere to temperatures of 1700 to 1900°C to densify. The sintering temperature is dependent on the type and quantity of sintering additives utilized. Densification of silicon nitride compacts occurs through a number of distinct steps. Microwave heating has the capability for volumetric thermal heating of ceramic materials. Silicon nitride-based materials heat in a microwave field by coupling to the sintering additives or grain boundary phases. Previous studies on microwave processing of silicon nitride have reported improved densification during sintering, accelerated nitridation of silicon, and improved high-temperature mechanical properties with thermal annealing of dense materials. In the present research, microwave-sintered silicon nitride ceramics were examined, and the densification behavior and microstructure development correlated with the mechanical properties.

6967 (CONF-910908–3) **High temperature tensile and fatigue strengths of Si_3N_4.** Liu, K.C.; Stevens, C.O.; Brinkman, C.R. Oak Ridge National Lab., TN (United States). [1991]. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From 2. conference of the European Ceramic Society; Augsburg (Germany); 11-14 Sep 1991. Order Number DE92005170. Source: OSTI; NTIS; GPO Dep.

Uniaxial tensile fracture and cyclic fatigue data are reported for a grade of HIPed Si_3N_4. The tensile strength was found to be sensitive to stressing rate at temperatures above 1000°C, indicating highly viscoplastic processes were in operation. Both tensile fracture strength and fatigue resistance decreased rapidly as temperature was increased from 1200 to 1370°C. Cycling from low stress to high stress levels in intermittent steps was beneficial to high-cycle fatigue strength due to some strengthening mechanism.

6968 (CONF-911202–14) **Distribution and characterization of iron in implanted silicon carbide.** Bentley, J. (Oak Ridge National Lab., TN (United States)); Romana, L.J.; Horton, L.L.; McHargue, C.J. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Annual fall meeting of the Materials Research Society; Boston, MA (United States); 2-6 Dec 1991. Order Number DE92005126. Source: OSTI; NTIS; INIS; GPO Dep.

Analytical electron microscopy (AEM) and Rutherford backscattering spectroscopy-ion channeling (RBS-C) have been used to characterize single crystal α-silicon carbide implanted at room temperature with 160 keV ^{57}Fe ions to fluences of 1, 3, and 6 $\times 10^{16}$ ions/cm^2. Best correlations among AEM, RBS, and TRIM calculations were obtained assuming a density of the amorphized implanted regions equal to that of crystalline SiC. No iron-rich precipitates or clusters were detected by AEM. Inspection of the electron energy loss fine structure for iron in the implanted specimens suggests that the iron is not metallically-bonded, supporting conclusions from earlier conversion electron Moessbauer spectroscopy (CEMS) studies. In-situ annealing surprisingly resulted in crystallization at 600°C with some redistribution of the implanted iron.

6969 (CONF-9106303–, pp. 128-129) **SiO_2 membranes for H_2 separation in coal gas processing.** Gavalas, G.R. (California Inst. of Tech., Pasadena (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-89PC89765. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to synthesize permselective ceramic membranes by chemical vapor deposition of SiO_2, TiO_2 and other pure or mixed oxides within the walls of porous support tubes, to characterize the membranes by permeability measurements and scanning electron microscopy, and to develop a mathematical model of the chemical vapor deposition. The amorphous oxide membranes (SiO_2, TiO_2) are very selective to hydrogen permeation and are stable at high temperatures. These properties make them applicable to hydrogen production from coal gas for fuel cell power generation or chemical synthesis. One-sided deposition of SiO_2 was carried out successfully to prepare membranes with higher permeation coefficients than previously possible. TiO_2 deposition in the opposing reactants geometry was found to take place over a broad temperature range. A new deposition model was developed that gives good agreement with the measured SiO_2 and TiO_2 density profiles.

6970 (CONF-9109229–2) **Steady-state creep of hot-pressed silicon carbide whisker-reinforced silicon nitride.** Koester, D.A. (North Carolina State Univ., Raleigh, NC (United States). Dept. of Materials Science and Engineering); Davis, R.F.; More, K.L. Oak Ridge National Lab., TN (United States). [1991]. 8p. Sponsored by U.S. DOE Conservation & Renewable Energy; U.S. Department of Defense. DOE Contract AC05-84OR21400. Grant DAALOG-86-0013. From 1. Canadian international composites conference and exhibition; Montreal (Canada); 4-6 Sep 1991. Order Number DE92004461. Source: OSTI; NTIS; GPO Dep.

The research reported herein concerns the constant compressive stress creep behavior of a 30 vol% SiC whisker-reinforced Si_3N_4 containing 6.0 wt% Y_2O_3 and 1.5 wt% Al_2O_3 additives. Creep data will be presented and integrated with an examination of the microstructure obtained via transmission electron microscopy (TEM) and scanning electron microscopy (SEM).

6971 (DOE/ER/45209–6) **Defect structure of semiconducting and insulating epitafial oxides: Progress report, May 1, 1991–April 30, 1992.** Wessels, B.W. Northwestern Univ., Evanston, IL (United States). [1991]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER45209. Order Number DE92005080. Source: OSTI; NTIS; GPO Dep.

The study of the defect structure of semiconducting and insulating epitaxial oxides has continued. During this period, the growth and characterization of epitaxial $BaTiO_3$ and $SrTiO_3$ layers were undertaken. For the growth of the epitaxial oxides, an organometallic chemical vapor deposition technique was developed. For the deposition of $BaTiO_3$, we developed and used the second generation Ba precursor, barium (hexafluoroacetylacetonate)$_2$ (tetraglyme)(Ba(hfa)$_2$·tet) along with titanium tetraisoproxide as the titanium precursor. Recently, we have succeeded in depositing epitaxial $BaTiO_3$ by using single crystalline $LaAlO_3$ substrates. This development should significantly improve our electronic property and defect structure measurements since grain boundaries are eliminated in the layers. The structure of the epitaxial $BaTiO_3$ was examined using both x-ray diffractometer measurements and high-resolution transmission electron microscopy (HRTEM).

6972 (DOE/ER/45228–9) **Surfaces and interfaces of ceramics and metals for period July 1988–June 1991.** Arizona State Univ., Tempe, AZ (United States). [1991]. 39p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER45228. Order Number DE92004069. Source: OSTI; NTIS; GPO Dep.

During this three-year grant period our research program has been both expanded in its scope and established more firmly on knowledge of the basic materials involved. New techniques have been brought into play and these have allowed a more complete understanding of the nature and form of the surfaces of the oxide ceramics. There have been several surprising developments. One is the discovery of surface superlattice structures on surfaces of oxide crystals of oxide crystals (MgO, Al_2O_3, TiO_2). Unlike most of the surface-reconstruction superlattices reported in the surface science literature, these are not structures confined to ultra-high vacuum environments. They are formed by high temperature annealing in air or oxygen and are stable for extended periods of exposure to the atmosphere as well as in UHV, and hence may well be relevant to surfaces properties of the oxides under the conditions appropriate to many technological applications.

6973 (DOE/ER/45338–1) **Modeling and experimental studies of oxide covered metal surfaces: TiO_2/Ti a model system: Progress report.** Smyrl, W.H. Minnesota Univ., Minneapolis, MN (United States). [1991]. 57p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER45338. Order Number DE92004053. Source: OSTI; NTIS; GPO Dep.

Prior work in our laboratories at the Corrosion Research Center has shown that thin, anodic TiO_2 films formed by the Slow Growth Mode (SGM) on polycrystalline titanium and microcrystalline with a texture that varies from one metal grain to another. Furthermore, the underlying metal grains are mapped by the photoelectrochemical response of the oxide. The same characteristics have also been demonstrated in our laboratory for ZnO grown on Zn. The TiO_2/Ti system has been chosen for study both because of its importance in energy systems, and because it can serve as a model system for other metal-metal oxide couples. The investigations of anodic TiO_2 films on Ti have shown that the properties of thin films are consistent with the rutile form of the oxide. Both experimental data and theoretical calculations show the close resemblance to results on single crystal TiO_2. Furthermore, the modeling studies reveal that the optical transitions near the bandedge arise from the bulk band structure. The photoelectrochemical properties of anodic TiO_2 films have now been shown to obey the simple Gaertner-Butler model for the semiconductor-electrolyte interface, with a few modifications. The most important deviation has now been shown to be a result of multiple internal reflections in the oxide film.

6974 (ENEA-RT-INN–90-56) **Composite ceramic powders obtained by laser induced reactions of silane and amines.** Borsella, E.; Botti, S.; Fantoni, R.; Alescandrescu, R.; Morjan, I.; Dikonimos-Makris, T.; Giorgi, R.; Enzo, S. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta; ENEA, Casaccia (Italy). Area Energia e Innovazione; Venice Univ. (Italy). Jun 1991. 30p. (RT/INN–90-56). Order Number DE92744020. Source: OSTI; NTIS (US Sales Only).

Ultrafine, ternary (Si/C/N) ceramic powders were produced after CO_2 laser initiated reactions between silane and mono- or dimethylamine. Several chemical and spectroscopic diagnostics (mass spectrometry, chemical analysis, IR spectrophotometry, X-Ray photo-electron spectroscopy, X-Ray diffraction analysis) were employed to correlate the parameters relevant to gas phase reactions and the final composition of the powder.

6975 (ENEA-RT-NUCL–90-47) **Transport properties of Bi-Sr-Ca-Cu-O and Y-Ba-Cu-O single crystals.** Boffa, V.; Murtas, F.; Paterno', G.; Gambardella, U.; Paroli, P.; Licci, F. ENEA, Frascati (Italy). Area Nucleare; Rome-2 Univ. (Italy). Jun 1991. 10p. (CONF-9009458–1: 1990 applied superconductivity conference, Snowmass Village, CO (United States), 24 Sep 1990; RT/NUCL–90-47). Order Number DE92744025. Source: OSTI; NTIS (US Sales Only).

From 1990 applied superconductivity conference; Snowmass Village, CO, USA (24-28 Sep 1990).

The ability of type two superconductors to carry large critical currents, in the presence of high magnetic fields, is related to the pinning force acting on the flux lines. In the new high temperature superconductors, the pinning barrier energy is relatively low, and flux motion effects are unusually large. The knowledge of the pinning energy is very important in order to understand the transport properties of these materials. Recently, it has been shown that the broadening of the resistive transition of single crystals in the presence of magnetic fields can be related to thermally activated flux motion (flux creep). This paper reports on an investigation of the temperature dependence of the resistance of $Bi_2Sr_2CaCu_2O_y$ and $YBa_2Cu_3O_y$ single crystals in the presence of an external field of up to 6 Tesla with the magnetic field directed along the c axis. The measurements were performed with a d.c. bias by a four leads configuration. The data are discussed with reference to the thermally activated flux motion and with the temperature dependence of the activation energy taken into account.

6980 (IS-T–1601) **Silyl-acetylene polymers for use as precursors to silicon carbide fibers.** Meyer, M.K. Ames Lab., IA (United States). 20 Dec 1991. 195p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE92005097. Source: OSTI; NTIS; GPO Dep.

The steps involved in production of silicon carbide fiber using silyl acetylene polymer precursors can be separated into four processing steps: polymer synthesis, fiber spinning, fiber crosslinking, and pyrolysis. Practical experimental considerations in each step are discussed.

6981 (Juel–2475) **The influence of the oxygen partial pressure on the quasi-ternary system Cr-Mn-Ti-oxide.** Garcia-Rosales, C.; Schulze, H.A.; Naoumidis, A.; Nickel, H. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Reaktorwerkstoffe; Technische Hochschule Aachen (Germany). May 1991. 123p. (In German). Order Number DE92758890. Source: OSTI; NTIS (US Sales Only); INIS.

Dissertation submitted by C. Garcia-Rosales.

The passivation layers formed by the oxidizing corrosion of high temperature alloys consist primarily of oxides and mixed oxides of the elements chromium, manganese and titanium. For a reproducible formation and characterization of such oxide layers it is necessary to know the phase equilibria of these oxide systems at temperature and oxygen partial pressure conditions which will be relevant during their application. For the investigation of the quasi-ternary system Cr-Mn-Ti-oxide, oxide powders were prepared and annealed at 1000deg C under different oxygen partial pressures ranging from 0.21 bar to 10^{-21} bar. Phase identification and determination of lattice parameter using X-ray diffraction analysis as well as the direct measurement of phase boundaries as a function of oxygen partial pressure using the emf-methode were carried out for these investigations. In the quasi-ternary system Cr-Mn-Ti-oxide the spinels play a decisive role in the oxigen partial pressure range examined. The spinel $MnCr_2O_4$ may be regarded as the most significant compound. Part of the chronium can be replaced by trivalent manganese at high oxygen partial pressures and by trivalent titanium at low pressures, and the formation of a solid solution with the spinel Mn_2TiO_4 is possible in all cases. In this way a coherent single-phase spinel region is observed which extends over the entire oxygen partial pressure range form 0.21 bar to 10^{-21} bar examined at 1000deg C. (orig.).

6982 (Juel-2487) **Properties of plasma sprayed oxides on metallic substrates.** Schuetz, H.G. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Angewandte Werkstofforschung; Technische Hochschule Aachen (Germany). Jun 1991. 150p. (In German). Order Number DE92758988. Source: OSTI; NTIS (US Sales Only).

Metallic substrates were coated with Cr_2O_3, Al_2O_3, ZrO_2-7%Y_2O_3 by plasma spray technique. An aim of this work was the investigation of the bonding mechanism between substrate and coating. From the results achieved by several analyzing methods (SEM, SNMS) it was concluded that mechanical bonding of the spray particles on rough metallic substrate surfaces was the dominant adhesion mechanism. In a second step the influence of substrate material and -temperature on residual stress condition in chromia coatings was investigated. As analyzing method X-ray diffraction was applied. Further the phase composition of oxides was determined in dependance of the different process variants applied APS (= atmospheric plasma spraying), VPS (= vacuum plasma spraying) and IPS (= inert gas plasma spraying). Post heat treatment of coated samples influenced the phase composition and produced chemical reactions at the coating/substrate interface. (orig.).

6983 (KAERI/RR-977/90) **The development of SiC whisker fabrication technology for nuclear applications.** Kang, Thae Khapp (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kuk, Il Hiun; Kim, Chang Kyu; Lee, Jae Chun; Lee, Ho Jin; Park, Soon Dong; Im, Gyeong Soo. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1991. 139p. (In Korean). Order Number DE92614834. Source: OSTI; NTIS (US Sales Only); INIS.

Some important experiments for whisker growth reactions, fabrication processes, and experiments for fabricarion of whisker reinforced composites have been performed. In order to investigate growth reaction of SiC whiskers, a conventional carbothermic reaction was tested. Based on the results of carbothermic process, a new process called silicothermic reaction was planned and some basic experiments were performed. Reaction characteristics of silicon monoxide, core material for SiC whisker growth in both of the reactions were investigated for basic data. Additionally, a hydrofluoric acid leaching process was tested for developing SiC whisker recovery process, and powder metallurgy process and melt sqeeze process were tried to develop aluminum-SiC whisker composites. (Author).

6984 (KCP-613-4480) **Selective plasma etching: Final report.** Franti, G.W. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Dec 1991. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. Order Number DE92004794. Source: OSTI; NTIS; GPO Dep.

Plasma etching of silicon nitride glassivation layers on silicon dice using CF_4 was successfully carried out with a commercial plasma etcher. The parameters of power level and partial pressure gas were downscaled from the commercial plasma etcher to a bench-top plasma etcher. Plasma etching of silicon nitride was successfully performed in the bench-top plasma etcher. 1 ref., 6 figs.

6985 (LBL-29964) **Structural and interfacial characteristics of thin (<10 nm) SiO_2 films grown by electron cyclotron resonance plasma oxidation on [100] Si substrates.** Nguyen, T.D.; Carl, D.A.; Hess, D.W.; Lieberman, M.A.; Gronsky, R. Lawrence Berkeley Lab., CA (United States). Apr 1991. 12p. Sponsored by U.S. DOE Energy Research; U.S. Department of Defense; National Science Foundation. DOE Contract AC03-76SF00098 ;FG03-87ER13727. Contract F49620-87-K-0001;Grant ECS-8517363;Grant ENG-8710988. (CONF-910406-38: Spring meeting of the Materials Research Society (MRS), Anaheim, CA (United States), 29 Apr - 3 may 1991). Order Number DE92004425. Source: OSTI; NTIS; INIS; GPO Dep.

The feasibility of fabricating ultra-thin SiO_2 films on the order of a few nanometer thickness has been demonstrated. SiO_2 thin films of approximately 7 nm thickness have been produced by ion flux-controlled Electron Cyclotron Resonance plasma oxidation at low temperature on [100] Si substrates, in reproducible fashion. Electrical measurements of these films indicate that they have characteristics comparable to those of thermally grown oxides. The thickness of the films was determined by ellipsometry, and further confirmed by cross-sectional High-Resolution Transmission Electron Microscopy. Comparison between the ECR and the thermal oxide films shows that the ECR films are uniform and continuous over at least a few microns in lateral direction, similar to the thermal oxide films grown at comparable thickness. In addition, HRTEM images reveal a thin (1–1.5 nm) crystalline interfacial layer between the ECR film and the [100] substrate. Thinner oxide films of approximately 5 nm thickness have also been attempted, but so far have resulted in nonuniform coverage. Reproducibility at this thickness is difficult to achieve.

6986 (ORNL/Sub-85-55901/02) **Finite volume model for forced flow/thermal gradient chemical vapor infiltration.** Starr, T.L.; Smith, A.W. Oak Ridge National Lab., TN (United States); Georgia Tech Research Inst., Atlanta, GA (United States). Mar 1991. 26p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC05-84OR21400. Order Number DE92003765. Source: OSTI; NTIS; GPO Dep.

The forced flow/thermal gradient chemical vapor infiltration process (FCVI) has proven to be a successfully technique for fabrication of ceramic matrix composites. It is particularly attractive for thick components which cannot be fabricated using the conventional, isothermal method (ICVI). Although it offers processing times that are at least an order of magnitude shorter than ICVI, FCVI has not been used to fabricate parts of complex geometry and is perceived by many to be unsuitable for such components. The major concern is that selection and control of the flow pattern and thermal profile for optimum infiltration can be a difficult and costly exercise. In order to reduce this effort, we are developing a computer model for FCVI that simulates the densification process for given component geometry, reactor configuration and operating parameters. Used by a process engineer, this model can dramatically reduce the experimental effort needed to obtain uniform densification.

6987 **Low density metal hydride foams.** Maienschein, J.L.; Barry, P.E. To Dept. of Energy. 1990. Filed date 31 May 1990. USA Patent patent application 7-531,363. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003729. Source: OSTI; NTIS; GPO Dep.

Disclosed is a low density foam having a porosity of from 0 to 98% and a density less than about 0.67 gm/cc, prepared by heating a mixture of powdered lithium hydride and beryllium hydride in an inert atmosphere at a temperature ranging from about 455 to about 490 K for a period of time sufficient to cause foaming of said mixture, and cooling the foam thus produced. Also disclosed is the process of making the foam. 6 figs.

6988 **High density crystalline boron prepared by hot isostatic pressing in refractory metal containers.** Hoenig, C.L. To Dept. of Energy. 1990. Filed date 18 Jun 1990. USA Patent patent application 7-539,392. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003749. Source: OSTI; NTIS; GPO Dep.

Boron powder is hot isostatically pressed in a refractory metal container to produce a solid boron monolith with a bulk density at least 2.22 g/cc and up to greater than 2.34 g/cc. The refractory metal container is formed of tantalum, niobium, tungsten, molybdenum or alloys thereof in the form of a canister or alternatively plasma sprayed or chemical vapor deposited onto a powder compact. Hot isostatic pressing at 1800°C and 30 KSI (206.8 MPa) argon pressure for four hour produces a bulk density of 2.34 g/cc. Complex shapes can be made.

6989 (PNL-SA-19687) **Thermal conductivities of thin, sputtered optical films.** Henager, C.H. Jr.; Pawlewicz, W.T. Pacific Northwest Lab., Richland, WA (United States). May 1991. 33p. Sponsored by U.S. DOE Nuclear Energy; U.S. Department of Defense. DOE Contract AC06-76RL01830. Contract RADC F3 0602-90-F-0008. Order Number DE92004486. Source: OSTI; NTIS; INIS; GPO Dep.

The normal component of the thin film thermal conductivity has been measured for the first time for several advanced sputtered optical materials. Included are data for single layers of boron nitride (BN), aluminum nitride (AlN), silicon aluminum nitride (Si-Al-N), silicon aluminum oxynitride (Si-Al-O-N), silicon carbide (SiC), and for dielectric-enhanced metal reflectors of the form $Al(SiO_2/Si_3N_4)^n$ and $Al(Al_2O_3/AlN)^n$. Sputtered films of more conventional materials like SiO_2, Al_2O_3, Ta_2O_5, Ti, and Si have also been measured. The data show that thin film thermal conductivities are typically 10 to 100 times lower than conductivities for the same materials in bulk form. Structural disorder in the amorphous or very fine-grained films appears to account for most of the conductivity difference. Conclusive evidence for a film/substrate interface contribution is presented.

6990 (RFP-4528) **Fabrication of aluminum nitride crucibles for molten salt and plutonium compatibility studies.** Phillips, J.A. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 24 Jul 1991. 195p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC34-90DP62349. Order Number DE92004002. Source: OSTI; NTIS; INIS; GPO Dep.

Thesis submitted to Colorado School of Mines, Golden, CO.

The overall objective of this research was to fabricate a calcium oxide sinter-aided aluminum nitride crucible and determine the compatibility of this crucible with molten chloride salts and plutonium metal in the DOR process. Calcium oxide sinter-aided aluminum nitride was preferred over yttrium oxide sinter-aided aluminum nitride because of (1) the presence of calcium chloride, calcium oxide, and calcium metal in the molten salts utilized in the DOR process, and (2) the higher volatility of the secondary phases formed compared with phases resulting from the addition of yttrium oxide during the aluminum nitride sintering process. The calcium oxide system may yield a higher purity crystal structure with fewer secondary phases present than in the yttrium oxide system. The secondary phases that are present in the grain boundaries may be unreactive with the calcium chloride salt due to the presence of calcium in the secondary phases.

6991 (ANL-89/34) **Chemical alteration of limestone and marble samples exposed to acid rain and weathering in the eastern United States, 1984–1988.** Reimann, K.J. Argonne National Lab., IL (United States). Jun 1991. 105p. Sponsored by U.S. Department of the Interior. DOE Contract W-31109-ENG-38. Order Number DE92004050. Source: OSTI; NTIS; GPO Dep.

In a long-term program that began in 1984, limestone and marble briquettes have been exposed to both anthropogenic acid deposition and natural weathering of four field sites in the eastern United States. Similar tests began at an Ohio site in 1986. Effects of exposure on the briquettes and other materials at the sites are evaluated periodically by several federal agencies cooperating in the National Acid Precipitation Assessment Program (NAPAP). A primary contribution of Argonne National Laboratory to the NAPAP has been chemical analysis to determine changes in the samples caused by exposure to the environment. Wet chemical analysis was used to detect sulfates, nitrates, fluorides, chlorides, and a series of metal cations in sequential layers of stone removed from the briquettes after field exposure. Results from the first four years of the program indicate that rinsing by rain keeps skyward-facing stone relatively clean of reaction products, especially sulfate, the most abundant product. On groundward-facing samples, sulfate concentrations increased linearly with exposure time, and values were proportional to atmospheric SO_2 concentrations at the site. Sulfate concentrations in groundward samples were much higher in limestone than in marble, because of the greater porosity of the limestone. A steep sulfate gradient was seen in both sample types from the surface to the interior. On skyward surfaces, material losses per rain event due to complete dissolution of accumulated sulfates were approximately equal to concentrations measured in runoff. Preexposed limestone samples had sulfate accumulations deep in their interiors, while fresh, unexposed limestone did not. No substantial changes in cation accumulations wee detected in either limestone or marble.

6992 (BNL-46226) **Determination of polymerization particle morphology using synchrotron computed microtomography.** Jones, K.W. (Brookhaven National Lab., Upton, NY (United States)); Spanne, P.; Lindquist, W.B.; Conner, W.C.; Ferrero, M. Brookhaven National Lab., Upton, NY (United States). Oct 1991. 18p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC02-76CH00016 ;FG02-90ER25084. Grant CTS 89-21381. (CONF-910921-1: 2. European conference on accelerators in applied research and technology, Frankfurt am Main (Germany), 3-7 Sep 1991). Order Number DE92004992. Source: OSTI; NTIS; INIS; GPO Dep.

Polymerization of monomers over heterogeneous catalysts results in the fragmentation of the catalysts and subsequent transport in the polymer particles that are produced. Characterization of the process using nondestructive synchrotron computed microtomography techniques makes possible measurement of the distribution of the catalyst fragments in an individual particle and, in addition, gives an estimate of the particle porosity and surface area. The present experiment was carried out using the x-ray microscopy facility at the Brookhaven National Synchrotron Light Source (NSLS) X26 beam line. The tomographic sections were analyzed using autocorrelation techniques to determine porosity and surface area values. The results are compared to values obtained using conventional methods. This procedure makes possible the extraction of quantitative information about porosity and specific area from the tomograms. 9 refs., 7 figs., 1 tab.

6993 (CONF-911154-1) **Use of energetic ion beams in materials synthesis and processing.** Appleton, B.R. Oak Ridge National Lab., TN (United States). [1991]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From International conference on evolution in beam applications; Takasaki (Japan); 5-8 Nov 1991. Order Number DE92003529. Source: OSTI; NTIS; GPO Dep.

A brief review of the use energetic ion beams and related techniques for the synthesis, processing, and characterization of materials is presented. Selected opportunity areas are emphasized with examples, and references are provided for more extensive coverage.

6994 (CONF-911202-21) **Annealing of Pb-implanted $SrTiO_3$ in the presence of water vapor: A study using $D_2{}^{18}O$ labelling.** McCallum, J.C. (Royal Melbourne Inst. of Tech. (Australia). Microelectronics and Materials Technology Centre); Simpson, T.W.; Mitchell, I.V.; Rankin, J.; Boatner, L.A. Oak Ridge National Lab., TN (United States). [1991]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Annual fall meeting of the Materials Research Society; Boston, MA (United States); 2-6 Dec 1991. Order Number DE92005168. Source: OSTI; NTIS; GPO Dep.

We report new measurements of the regrowth behaviour of Pb-implanted $SrTiO_3$ crystals in the presence of water vapour. Doubly labelled water vapour, $D_2{}^{18}O$, at greater than 95% enrichment in each isotope has been added to the annealing ambient and depth profiles of D and ^{18}O have been obtained from the regrown crystals using secondary ion mass spectrometry (SIMS). The D and ^{18}O content has also been measured by nuclear reaction analysis

(NRA) using the reactions D(^{3}He, p)^{4}He and ^{18}O(pα)^{15}N. The crystals were regrown in a conventional furnace under a controlled gas ambient and time-resolved optical reflectivity (TRR) was used to dynamically monitor the regrowth rate during the anneal. An enhancement of the solid-phase epitaxial regrowth rate is observed when water vapour is added to the annealing ambient. This rate increase is accompanied by incorporation of D throughout the regrown layer. ^{18}O is incorporated into the lattice but does not appear to penetrate deep enough to influence the regrowth rate.

6995 (CONF-911272–1) **Ultra-high temperature (>2000°C) testing capability at Oak Ridge National Laboratory for carbon materials in air, inert gas and vacuum.** Huddleston, R.L.; O'Connor, D.G. Oak Ridge National Lab., TN (United States). [1991]. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From International symposium on ultra-high temperature materials; Tajimi City (Japan); 7 Dec 1991. Order Number DE92004445. Source: OSTI; NTIS; GPO Dep.

A new ultra-high temperature multiaxial (axial-torsional) test system concept is being developed for testing of carbon-carbon composite materials at temperatures up to 2200°C in air, argon, and vacuum. The basic system concept incorporates computer control of temperature, pressure, and strain, displacement, or load versus time such that one can either test materials in the conventional monotonic or cyclic mode or "fly a temperature-pressure-stress vs time profile" to simulate a vehicle trajectory from ground level to space or vice versa. A unique spherical hydrostatic bearing concept is being developed which should permit the system to transmit both axial and torsional loadings with low induced bending moments. The basic test system has been assembled and shakedown tests of ATJ graphite specimens conducted at temperatures up to 1910°C.

6996 (CONF-9106303–, pp. 165-166) **Improved utilization of coal derived fly ash in concrete.** Liskowitz, J.W. (New Jersey Inst. of Tech., Newark (United States)); Cerkanowicz, A.E.; Wecharatana, M. USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-90PC90299. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

Successful use of coal derived fly-ash in the formulation of concrete currently depends on long term testing of the suitability of sample ash-concrete formulations prior to ash acceptance. Existing tests have proven unreliable and have not provided correlation between formulated concrete strength and fly-ash/combustor/coal characteristics. This program represents a study of the interrelationship between the ash formation process, the ash properties, and the concrete quality. Given the coal type, and the combustion and ash collection conditions, the authors expect to predict the optimum use of the captured ash in concrete formulation. They further intend to use these results to develop an innovative ash quality test. Significant quantity of commercially generated coal fly-ash employing different combustion and collection processes has been obtained for evaluation. The influence of ash particle size, particle size distribution, surface and bulk chemical composition, and leaching treatments on fly-ash/concrete strength are being evaluated as a function of curing time.

6997 (DOE/ER/12107–1) **A study of potential high band-gap photovoltaic materials for a two step photon intermediate technique in fission energy conversion: Progress report for year one, December 1, 1990–November 30, 1991.** Missouri Univ., Columbia, MO (United States). 16 Aug 1991. 33p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-91ER12107. Order Number DE92004046. Source: OSTI; NTIS; GPO Dep.

A diamond synthesis chamber and an ion implanter have been constructed. Work has been rapidly progressing and diamond has been synthesized. There are five variables which affect the quality of diamond: (1) mass flow of methane, (2) mass flow of hydrogen, (3) filament temperature, (4) substrate temperature, and (5) substrate material. Enclosec are pictures and data of previous diamond growth experiments. Current work is focused on the conditions which produce the best quality diamond films. In this study, diamond films were deposited using a hot-filament CVD method with boron trioxide (B_2O_3) and diphosphorus pentoxide (P_2O_5) as the doping sources. P_2O_5 is the only known effective phosphorus source for forming n-type semiconducting material. An RF generator has been made operation for epitaxial growth of AlN by the chemical vapor deposition method. In initial experiments with a graphite substrate, the RF generator heated the material to a temperature of 1100°C. A reactor which will use the RF generator has been built for AlN synthesis. The device should be assembled and tested by the end of August. A new process for fabricating platinum silicide photovoltaic cells has been developed. A diffused guard ring has been added to minimize leakage current. VUV to near IR capability has been developed for optical characterization. A microwave driven excimer lamp has been built and tested. Our previous work used a microwave source on an electron cyclotron heated ion source.

6998 (DOE/ER/13482–6) **Transport properties of disordered porous media from the microstructure: Progress report, March 1, 1991–February 28, 1992.** Torquato, S. North Carolina State Univ., Raleigh, NC (United States). Dept. of Mechanical and Aerospace Engineering. Nov 1991. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER13482. Order Number DE92005467. Source: OSTI; NTIS; GPO Dep.

Progress has been made in five general areas: (1) the development of cross-property relations, i.e., relationships between one effective property and a different effective property; (2) the development of a systematic means to represent and calculate statistical correlation functions that arise in rigorous property relations for heterogeneous media, using statistical-mechanical methods; (3) the derivation and calculation of property relations which depend upon this microstructural information; (4) sterically hindered fragmentation in reactive solids using percolation theory and simulations; and (5) the use of Brownian-motion simulation techniques to "exactly" predict the effective properties of disordered media. We embarked on a new area of research, namely, the study of passive advection of tracer particles in random velocity fields.

6999 (DOE/ER/14185–1) **Ultrafast optical studies of surface reaction processes at semiconductor interfaces: Progress report, June 1, 1991–May 31, 1992.** Miller, R.J.D. Rochester Univ., NY (United States). Nov 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-91ER14185. Order Number DE92004019. Source: OSTI; NTIS; GPO Dep.

Electron transfer processes at interfaces constitute a large and important class of surface reactions. In addition, the rectifying properties of semiconductor interfaces makes these systems one of the simplest and most efficient systems for converting and storing optical energy. However, the primary events of interfacial electron or hole carrier transfer and competing non-radiative (energy loss) channels are not well understood at surfaces. This research has explored the use of two novel optical techniques, Surface Space Charge Electro-optic Sampling and Surface Restricted Transient Grating Spectroscopy, to obtain the time evolution of the surface spatial distribution of photogenerated charge carriers and the photocarrier population dynamics at semiconductor interfaces, respectively. These studies have shown that carriers arrive at GaAs (100) surfaces on the hundred femtosecond time scale and subsequently undergo interfacial charge transfer on the picosecond time scale to appropriate acceptors. These dynamics are competitive with carrier thermalization processes and support the concept that it may be possible to significantly improve energy conversion efficiencies by minimizing energy loss through carrier thermalization. The exact dynamics still need to be resolved. A new laser system has been developed in the first year of funding that is capable of 10 femtosecond time resolution. This system will have sufficient time resolution to completely resolve both the electron and hole carrier non-radiative relaxation processes as well as the interfacial carrier charge transfer dynamics.

7000 (DOE/ER/45220–8) **Mixed-ionic and electronic conductivity in polymers: Annual technical progress report.** Ratner, M.A.; Shriver, D.F. Northwestern Univ., Evanston, IL (United States). [1991]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER45220. Order Number DE92005076. Source: OSTI; NTIS; GPO Dep.

The aim in this portion of the research is to prepare new electroactive films with high ion mobility, and to characterize the transport properties of these materials. The classic conducting polymers, polyacetylene, polythiophene, and polypyrrole have dense structures that prevent rapid redox switching because of the low diffusivity of ions. The objective is to modify the last two polymers with pendant polyethers, which should greatly improve ion transport.

7001 (DOE/ER/45409–2) **Photomodulation spectroscopy of photocarrier dynamics, electronic defects and morphology of conducting polymers: Progress report.** Vardeny, Z.V. Utah Univ., Salt Lake City, UT (United States). Dept. of Physics. 8 Oct 1991. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER45409. Order Number DE92004687. Source: OSTI; NTIS; GPO Dep.

This is a progress report on the second period of activities associated with the DOE grant to the Physics Department of the University of Utah, starting on April 1st, 1991, on photocarrier dynamics, electronic defects and morphology of conducting polymers using the photomodulation spectroscopy. During the second period of this grant we have achieved impressive results and have started new studies, to be completed during the grant continuation period of the third year. We will describe our progress according to the material studied, since this is the best method to summarize our accomplishments. We have used a variety of techniques in our studies such as: CW photomodulation, photomodulation in the femtosecond and picosecond time ranges, CW resonant Raman scattering, transient photoinduced Raman scattering, electroabsorption, degenerate four-wave mixing and the newly technique of spin dependent photomodulation. These techniques have been used to obtain the transient electronic response of the studied conducing polymers.

7002 (ENEA-RT-NUCL–90-46) **Superconducting properties of high density Y-Ba-Cu-O sintered samples.** Boffa, V.; Murtas, F.; Paterno', G.; Alvani, C.; Casadio, S.; Penna, M.; Di Gioacchino, D.; Gambardella, U.; Vaccarazza, C. ENEA, Frascati (Italy). Area Nucleare; ENEA, Casaccia (Italy). Area Energia e Innovazione; Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Lab. Nazionale di Frascati. Jun 1991. 11p. (CONF-9009458–2: 1990 applied superconductivity conference, Snowmass Village, CO (United States), 24 Sep 1990; RT/NUCL–90-46). Order Number DE92744026. Source: OSTI; NTIS (US Sales Only).

From 1990 applied superconductivity conference; Snowmass Village, CO, USA (24-28 Sep 1990).

Resistive transitions and dc transport critical currents were measured on $YBa_2Cu_3O_{7-x}$ pellets. The samples were fabricated by the powder method at sintering temperatures ranging from 900 to 940 degrees C. They had a relative density higher than 92% of the theoretical density assumed equal to 6.36 g/cubic cm. The dependence of the critical current upon a weak applied field, up to 3 m Tesla, at liquid nitrogen temperature, was investigated. For a few samples, the temperature dependence of the resistance was measured in a magnetic field up to 5 Tesla. In this paper, the results were analyzed in terms of differences in sintering conditions.

7003 (INIS-BR–2853) **Study irradiation damage by fast neutrons in Portland cement by means of ultra-sound.** Rosa Junior, A.A. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). 1988 89p. (In Portuguese). Order Number DE92613450. Source: OSTI; NTIS (US Sales Only); INIS.

The effect of neutron irradiation in samples of Portland cement paste was evaluated, using the resonance frequency method and pulse velocity of ultra-sound technique. The samples were divide in three groups: 1) Monitoring samples; 2) Samples to gamma heating simulation; 3) Fast neutron irradiated samples in reactor core. Santa Rita Portland cement was utilized for samples preparation with water-cement rate of 0,40 l/kg. The irradiation was performed in the research reactor IEA-R1, at IPEN-CNEN/SP, with an integrated flux of 7,2 X 10 sup(18) n/cm sup(2) (E approx. 1 Mev). The samples of group 2 were submitted to special micro-waves heat treatment-with the same number of cycles of the reactor-which allowed the detection of fast neutron radiation effects within the predominant thermal effects. (author).

7004 (INIS-BR–2886) **Growth and characterization of monocrystals from HgI_2 semiconductor compound for using in X and gamma spectroscopy.** Faria, L.O. de. Minas Gerais Univ., Belo Horizonte, MG (Brazil). Dept. de Fisica. Sep 1987 91p. (In Portuguese). Order Number DE92613447. Source: OSTI; NTIS (US Sales Only); INIS.

Mercury Iodide (HgI_2) platelets were grown from the vapor phase in the presence of polymers. These platelets are convenient to be used as room temperature operating semiconductor radiation detectors. Experiments demonstrate that the growth of platelets depends on a two-stage mass transport instead of depending on just one, as it has been thought. HgI_2 platelets 30 mm^2 large and 90 μm thick were obtained in a sealed evacuated fused quartz tube and were characterized by etch pit density measurements. (author).

7011 (JAERI-M–91-134) **Radiation effects on polyethylene foam.** Tang Beilin (Japan Atomic Energy Research Inst., Neyagawa, Osaka (Japan). Osaka Lab. for Radiation Chemistry); Kaji, Kanako; Hatada, Motoyoshi; Yoshizawa, Iwao; Kohara, Choji. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1991. 53p. (In Japanese). Order Number DE92751046. Source: OSTI; NTIS (US Sales Only); INIS.

Studies have been carried out on radiation effects on open cell type polyethylene foam. The foam was irradiated with electron beam either in nitrogen atmosphere or in air and changes of strength, elongation, and gel fraction were measured. The gel-percent of the original foam (50%) increased by 30% after irradiation in nitrogen, while strength measured at room temperature, 70, and 100degC did not change by the irradiation. However, elongation measured at 70 and 100degC decreased considerably and dimension stability above 70degC was also improved. (author).

7012 (KFK–4894) **Radiation resistant, decontaminable and sealing jointing compounds for application in nuclear facilities.** Kunze, S. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Nukleare Entsorgungstechnik. Sep 1991. 17p. Order Number DE92750200. Source: OSTI; NTIS (US Sales Only); INIS.

The sealing jointing compounds applied in practice and already examined for decontaminability will be presented here. Solvent-free sealing compounds, emulsifiable in water, with low molecular epoxy resins as binders, quite a number of curing versions, and little hygroscopic filler mixtures adapted in grain size have been tested with a view to ceramic tile jointing in nuclear facilities. The sealing compounds were examined before and after exposure to gamma irradiation (300 KGy energy dose) for decontaminability, color, gloss and resistance to decontaminants. Out of fourteeen compounds exhaustively investigated ten are very well decontaminable and four well decontaminable. After exposure to radiation no or only minor changes in color and gloss, respectively, were observed. Visible changes such as cracking, bubbles, etc. were not found and the resistance to decontaminants was neither affected. It has even been possible to replace in the well decontaminable sealing compounds developed until now part of the epoxy resin binder with elasticizing components such as Thiokol which is very important as a base material for sealing compounds in the construction industry, but difficult to decontaminate. (orig.).

7013 (LA-UR–91-3982) **Physical properties of superconducting and ferromagnetic materials based on C_{60}.** Thompson, J.D. We present results of magnetization and pressure measurements on recently discovered superconductors K_3C_{60} and Rb_3C_{60}, as well as ferromagnetic C_{60} TDAE, and discuss the nature of the ground state suggested by these studies.

7014 (LBL–31390) **Far infrared conductivity of charge density wave materials and the oxygen isotope effect in high-T_c superconductors.** Creager, W.N. Lawrence Berkeley Lab., CA (United States). Sep 1991. 265p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC03-76SF00098. Grant DMR 84-00041;Grant DMR 83-51678. Order Number DE92004105. Source: OSTI; NTIS; INIS; GPO Dep.

The far infrared reflectance and conductivity of $(Ta_{1-x}Nb_xSe_4)_2I$ and TaS_3 have been measured to determine the origin of a huge infrared resonance that dominates the charge density wave (CDW) dynamics along with the pinned acoustic phason mode in the related materials $(TaSe_4)_2I$ and $K_{0.3}MoO_3$. The measurements cover frequencies from 3 to 700cm^{-1} and the temperature range from 15K to 300K. In the niobium-doped alloys $(Ta_{1-x}Nb_xSe_4)_2I$, the size and frequency of the giant infrared mode remain nearly constant as the impurity concentration x is increased. For TaS_3, the pinned acoustic phason near 0.5cm^{-1} dominates $\epsilon(\omega)$ and an additional small mode lies near 9cm^{-1}. The latter mode is much smaller than the infrared mode in other CDW materials. These results rule out several models of a "generic infrared mode" in CDW excitations. They are compared in detail to the predictions of a recent theory attributing the infrared mode to a bound collective mode localized at impurity sites within the crystal. The transmittance of $K_{0.3}MoO_3$ has been measured at 1.2K with a strong dc electric field applied across the crystal. Under these conditions, the charge density wave depins abruptly and carries large currents with near-zero differential resistance. For some samples, the low-frequency transmittance is enhanced slightly when the CDW depins. The magnitude of the oxygen isotope effect in the high-$T_c$superconductor $YBa_2Cu_3O_7$ has been determined by substitution of ^{18}O for ^{16}O. A series of cross-exchanges was performed on high-quality polycrystalline specimens to eliminate uncertainties due to sample heat treatments and sample inhomogeneities.

7015 (MLM–3709) **Quantitative powder x-ray diffraction analysis of the Li_2O-SiO_2 glass-ceramic system.** Tomlin, D.W. (Naval Research Lab., Washington, DC (United States)); Sullenger, D.B.; Cantrel, J.S. EG and G Mound Applied Technologies, Miamisburg, OH (United States). 28 Oct 1991. 37p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. Order Number DE92004777. Source: OSTI; NTIS; GPO Dep.

An improved quantitative analysis that use powder x-ray diffraction has been developed to determine the relative amounts of crystalline phases in samples of Li_2O-SiO_2 glass-ceramics. Existing methods were improved and extended, resulting in a means for estimating a sample's amorphous-to-crystalline content ratio. The quantitative polycrystalline and semi-quantitative amorphous results of this study are currently usable by the Materials Analysis Section at EG&G Mound Applied Technologies. A quality control procedure will be adapted and formulated from the methods developed in this study. 1 ref., 15 figs., 7 tabs.

7016 (MLM–3720(OP)) **Low temperature properties of engineering thermoplastics.** Kaye, C.J. EG and G Mound Applied Technologies, Miamisburg, OH (United States). [1991]. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-911023–1: 23. international technical conference of the Society for the Advancement of Materials and Process Engineering, New York, NY (United States), 22-24 Oct 1991). Order Number DE92004009. Source: OSTI; NTIS; GPO Dep.

There are currently a wide variety of engineering thermoplastics available for a multitude of applications. Because of present market requirements, there has been a limited demand for test results of the physical properties of these materials at low temperatures. Several potential applications exist, however, and as a result, several engineering thermoplastic samples were tested at –40 and –56.6°C. Although not all these tests followed the procedures specified by the American Society of Testing and Materials precisely, the data represent comparative data that can be utilized for further design efforts. The evaluations included tensile testing, compressive properties, and Izod impact testing. Several materials with varied glass loadings were studied to determine the low temperature tendencies these molding compounds would exhibit. Some of the resins examined were: polyetheretherketone (PEEK), polytherimide (PEI), polyphenylene sulfide (PPS), polyethersulfone (PES), polyphthlamide (PPA), and a liquid crystal polymer (Vectra A130). In all cases, no detrimental effect was discerned over this temperature range; the study also indicated that improvements in the physical properties could be expected.

7017 (ORNL/ATD–54/R1) **Fiberglass material specification II: Revision 1.** Frame, B.J.; Janke, C.J. Oak Ridge National Lab., TN (United States). Oct 1991. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92005405. Source: OSTI; NTIS; GPO Dep.

This report describes the requirements for composite parts to be furnished to Martin Marietta Energy Systems, Inc. Topics discussed include: Part Fabrication Requirements, Scope, and Applicable Documents.

7018 (ORNL/ATD–62) **Development of performance models for thick composites in compression.** Blake, H.W.; Grimsby, H.J.; Starbuck, J.M.; Welch, D.E. Oak Ridge National Lab., TN (United States). Applied Technology Div. Nov 1991. 114p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92004093. Source: OSTI; NTIS; GPO Dep.

This report details initial activities and results from an investigation into the failure of thick-section composite cylinders loaded in compression. The efforts are aimed at the development of models for predicting cylinder performance based on composite material strengths derived from ring and cylinder tests of unidirectional materials. Initial results indicate that existing failure theories are applicable provided that material strength allowables are based on representative tests, and that appropriate solutions for cylinder stresses are used. Both the failure criteria and stress solution must allow for the three-dimensional stress state and for the discrete layer construction. Predictions for an initial test cylinder, which achieved a record pressure in hydrotest, are consistent with the observed performance. Performance model results obtained for a range of laminate constructions indicate this design to be optimum. Improvements in test fixturing also contributed to the record performance for this first cylinder. This work is sponsored by the Director as a three-year project funded from the Oak Ridge National Laboratory seed-money program.

7019 (ORNL/ATD–63) **Fiberglass material specification III.** Frame, B.J.; Janke, C.J. Oak Ridge National Lab., TN (United States). Applied Technology Div. Oct 1991. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92005313. Source: OSTI; NTIS; GPO Dep.

This specification describes the requirements for composite parts of fiberglass to be furnished to Martin Marietta Energy Systems, Incorporated. (JL)

7020 (ORNL/Sub–90-SF204/1) **Corrosiveness of wet residential building thermal insulation—Mechanisms and evaluation of electrochemical methods for assessing corrosion behavior.** Stansbury, E.E. (Stansbury (E.E.), Knoxville, TN (United States)). Oak Ridge National Lab., TN (United States); Stansbury (E.E.), Knoxville, TN (United States). Oct 1991. 116p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. Order Number DE92004905. Source: OSTI; NTIS; GPO Dep.

An evaluation has been made of the corrosiveness of selected wet residential building thermal insulation materials in contact with low carbon steel. Investigations were conducted both in wet insulations and in filtered leachates from insulations derived from thirteen cellulosic, three mineral fiber and four foam products. Potentiodynamic polarization measurements are reported from which the overall corrosion response was assessed and then the techniques of Tafel and polarization resistance analysis applied to estimate corrosion rates. Corrosion rates were also estimated electrochemically using a direct reading instrument which performs the rate calculation based on the polarization resistance principle. Direct determinations of corrosion rate were based on weight loss measurements.

7021 **Liquid crystal polyester thermosets.** Benicewicz, B.C.; Hoyt, A.E. To Dept. of Energy. 1990. Filed date 4 Apr 1990. USA Patent patent application 7-504,217. 25p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92003838. Source: OSTI; NTIS; GPO Dep.

The present invention relates to the field of curable liquid crystal polyester monomers and to thermoset liquid crystalline polyester compositions prepared therefrom. It is an object of this invention to provide curable liquid crystalline polyester materials. Another object of this invention is to provide a process of preparing curable liquid crystal polyester monomers. Yet another object of this invention is to provide liquid crystalline blends of polyester materials. It is a further object of this invention to provide thermoset liquid crystalline polyester compositions. It is a still further object of this invention to provide thermoset liquid crystalline polyester compositions having a high heat resistance. 1 fig.

7022 **Ammonia-treated phosphate glasses useful for sealing to metals.** Brow, R.K.; Day, D.E. To Dept. of Energy. 1990. Filed date 30 Apr 1990. USA Patent patent application 7-516,935. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004611. Source: OSTI; NTIS; GPO Dep.

A method of improving surface-dependent properties of phosphate glass such as durability and wear resistance without significantly affecting its thermal expansion coefficient is provided which comprises annealing the glass in a dry ammonia atmosphere at temperatures approximating the transition temperature of the glass. The ammonia annealing treatment of the present invention is carried out for a time sufficient to allow incorporation of a thin layer of nitrogen into the surface of the phosphate glass, and the treatment improves the durability of the glass without the reduction in the thermal expansion coefficient that has restricted the effectiveness of prior ammonia treatments. The improved phosphate glass resulting from this method is superior in wear resistance, yet maintains suitable thermal expansion properties so that it may be used effectively in a variety of applications requiring hermetic glass-metal seals.

7023 **Low density microcellular foams.** LeMay, J.D. To Dept. of Energy. 1990. Filed date 8 Jun 1990. USA Patent patent application 7-535,007. 45p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003744. Source: OSTI; NTIS; GPO Dep.

Disclosed is a process of producing microcellular from which comprises the steps of: selecting a multifunctional epoxy oligomer resin; mixing said epoxy resin with a non-reactive diluent to form a resin-diluent mixture; forming a diluent containing cross-linked epoxy gel from said resin-diluent mixture; replacing said diluent with a solvent therefore; replacing said solvent with liquid carbon dioxide; and vaporizing off said liquid carbon dioxide under supercritical conditions, whereby a foam having a density in the range of 35–150 mg/cc and cell diameters less than about 1 μm is produced. Also disclosed are the foams produced by the process.

7024 **Phosphazene polymer containing composites and method for making phosphazene polymer containing composites.** Allen, C.A.; Grey, A.E.; McCaffrey, R.R.; Simpson, B.M.; Stone, M.L. To Dept. of Energy. 1990. Filed date 30 Jul 1990. USA Patent patent application 7-559,234. 22p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC07-76ID01570. Order Number DE92003826. Source: OSTI; NTIS; GPO Dep.

It is object of the invention to provide a composite material comprised of phosphazene polymer. A feature of phosphazene-containing composites is their superior stiffness, thermal stability, and hardness which is lacking in more typical composite constituents. An advantage of using phosphazene composites is a wider range of applications, including uses in harsh environments. Another object of the present invention provides a method for producing phosphazene-containing composite materials through a pultrusion process. In brief, these and other objects are achieved by a composite produced by first coating a reinforcing material with an inorganic phosphazene compound and then polymerizing the phosphazene compound so as to confer superior thermal, physical and chemical resistance qualities to the composite. 2 figs., 6 tabs.

7025 (SAND–91-1392C) **Ge surface displacements due to low energy particles.** Picraux, S.T.; Horn, K.M.; Chason, E.; Tsao, J.Y.; Bedrossian, P.; Klitsner, T.; Brice, D.K. Sandia National Labs., Albuquerque, NM (United States). [1991]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC04-76DP00789. (CONF-911202–9: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92004351. Source: OSTI; NTIS; GPO Dep.

The production of surface defects by low energy ^{4}He and Xe ions incident on very smooth Ge(001) 2 × 1 surfaces is reported. Roughening at -50°C by 100–500 eV is measured by RHEED in real-time using the intensity of the out-of-phase specular beam. For He the surface displacements per ion range from 0.05 to 0.3 and are comparable to our binary collision predictions of the surface vacancy production rate for a displacement threshold energy of 11 eV (3/4's of bulk value). For Se the rate ranges from 2 to 10 (~) and falls between the calculated total vacancy and total defect (vacancy + interstitial) production rates.

7026 (SAND–91-1477C) **Bonding of hydrogen implanted at 80K into III-IV semiconductors.** Stein, H.J. Sandia National Labs., Albuquerque, NM (United States). [1991]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-911202–6: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92004354. Source: OSTI; NTIS; GPO Dep.

Hydrogen implantation at 80K is shown to introduce As-H centers in GaAs and InAs, and P-H centers in InP. These As(P)-H centers anneal between 150 and 300K. By analogy to suggested defect assignments in electron-irradiated GaAs, it is suggested that the sites for the As(P)-H centers are metastable defects such as close vacancy-interstitial pairs. In contrast to GaAs, where absorption by Ga-H centers increases upon loss of As-H, no absorption attributable to In-H was observed in either InAs or InP. Hydrogen in an As vacancy is the suggested model for Ga-H centers. If such vacancies are thermally unstable in In-based compounds, it would explain an absence of In-H bonds and may reduce the capability for ion implantation to produce electrical isolation in In-based compound semiconductors. 19 refs., 6 figs.

7027 (SAND–91-1635C) **Collisional energy deposition threshold for extended damage depths in ion-implanted silicates.** Arnold, G.W. (Sandia National Labs., Albuquerque, NM (United States)); Battaglin, G.; Boscolo-Boscoletto, A.; Caccavalle, F.; De Marchi, G.; Mazzoldi, P.; Miotello, A. Sandia National Labs., Albuquerque, NM (United States). [1991]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-911202–4: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92004737. Source: OSTI; NTIS; GPO Dep.

Many properties of implanted fused silica (e.g., surface stress, hardness) exhibit maximum implantation-induced changes for collisional energy deposition values of $\sim 10^{20}$ keV/cm^3. We have observed a second critical energy deposition threshold value of about 10^{22} keV/cm^3 in stress and hardness measurements as well as in many other experiments on silicate glasses (leaching, alkali depletion, etching rate, gaseous implant redistribution). The latter show evidence for damage depths exceeding TRIM ranges by about a factor of 2. For crystalline quartz, a similar threshold value has been found for extended damage depths (greater than TRIM) for 250 kev ions (H-Au) as measured by RBS and interference fringes. This phenomenon at high damage deposition energy may involve the large stress gradients between damaged and undamaged regions and the much increased diffusion coefficient for defect transport. 13 refs., 6 figs.

7028 (SAND–91-1803C) **The use of electrophoretically deposited diamond powder coatings as a precursor for chemically vapor deposited diamond.** Panitz, J.K.G. Sandia National Labs., Albuquerque, NM (United States). [1991]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9109319–1: 8. target fabrication specialists' meeting, Albuquerque, NM (United States), 23-26 Sep 1991). Order Number DE92003957. Source: OSTI; NTIS; GPO Dep.

It has generally been observed that in order in expedite the formation of chemical vapor deposited (CVD) diamond coatings, it is desirable to prepare a substrate by "seeding" it with diamond powder. We have determined that thick, stress free, shaped, diamond powder coatings can be electrophoretically deposited in a relatively short amounts of time. These diamond powder precursor coatings are then densified in a hot filament assisted CVD reactor to produce good quality CVD diamond/diamond powder composites. This combination of deposition techniques avoids many potential problems associated with predominantly CVD diamond.

7029 (SAND–91-2509C) **Structure and topology of silica aerogels.** Schaefer, D.W. (Sandia National Labs., Albuquerque, NM (United States)); Olivier, B.J.; Ashley, C.S.; Richter, D.; Farago, B.; Frick, B.; Hrubesh, L.; van Bommel, M.J.; Long, G. Sandia National Labs., Albuquerque, NM (United States). [1991]. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789 ;W-7405-ENG-48. (CONF-910960–3: 3. international symposium on aerogels, Wuerzburg (Germany), 30 Sep - 2 oct 1991). Order Number DE92004728. Source: OSTI; NTIS; GPO Dep.

Neutron spin-echo spectroscopy is used to study the topology of aerogels. Topology or connectivity is varied through precursor chemistry and thermal annealing. Topology is characterized using the concept of fractons (the vibrational excitations of a fractal network). A qualitative difference is observed in the spectrum of polymeric vs colloidal aerogels, the latter showing a peak in the density of vibrational states. For colloidal aerogels whose structure appears to arise from phase separation in the solution precursor, low-energy excitations were only observed in the lowest density material studied. Finally, a transition from fractal to colloidal microstructure was observed during the sintering of polymeric aerogels. This transformation revealed itself as a transition from a fracton-like to a peaked density of states function. 23 refs., 7 figs.

7030 (SAND–91-2826C) **Syntheses and properties of κ-phase organic superconductors.** Wang, H.H. (Argonne National Lab., IL (United States)); Carlson, K.D.; Geiser, U.; Kini, A.M.; Schultz, A.J.; Williams, J.M.; Welp, U.; Darula, K.E.; Hitsman, V.M.; Lathrop, M.W.; Megna, L.A.; Mobley, P.R.; Yaconi, G.A.; Schirber, J.E.; Overmyer, D.L. Sandia National Labs., Albuquerque, NM (United States). [1991]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC04-76DP00789 ;W-31109-ENG-38. (CONF-911202–8: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92004353. Source: OSTI; NTIS; INIS; GPO Dep.

The syntheses and physical properties of κ-(ET)$_2$Cu[N(CN)$_2$]X (X=Br and Cl) are summarized. The κ-(ET)$_2$Cu[N(CN)$_2$]Br salt is the highest $T_c$radical-cation based ambient pressure organic superconductor (T_c=11.6 K), and the κ-(ET)$_2$Cu[N(CN)$_2$]Cl salt becomes a superconductor at even higher $T_c$under 0.3 kbar hydrostatic pressure (T_c=12.8 K). The similarities and differences between κ-(ET)$_2$Cu[N(CN)$_2$]Br and κ-(ET)$_2$Cu(NCS)$_2$ (T_c=10.4 K) are presented. The X-ray structures at 127 K reveal that the the S···S contacts shorten between ET dimers in the former compound while the S···S contacts shorten within dimers in the latter. The difference in their ESR linewidth behavior is also explained in terms of the structural differences. A semiconducting compound, (ET)Cu[N(CN)$_2$]$_2$, isolated during κ-(ET)$_2$Cu[N(CN)$_2$]Cl synthesis is also reported. The ESR measurements of the κ-(ET)$_2$Cu[N(CN)$_2$]Cl salt indicate that the phase transition near 40 K is similar to the spin density wave transition in (TMTSF)$_2$SbF$_6$. A new class of organic superconductors, κ-(ET)$_2$Cu$_2$(CN)$_3$ and κ-(ET)$_2$Cu$_2$(CN)$_{3-\delta}$Br$_\delta$, is reported with T_c's of 2.8 K (1.5 kbar) and 2.6 K (1 kbar), respectively.

7031 (UCRL–53868-90, pp. 4.9-4.13) **Ductile grinding of glass.** Blaedel, K.L.; Davis, P.J.; Nikkel, D.J. Jr. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors goal is to develop a process that will generate finished precision optical components in less time and at a significantly lower cost. Achieving this goal would benefit the Laboratory's Laser Fusion Program as well as programs involving astronomical telescopes and space defense. Their investigation has focused on ductile or shear mode grinding. Because little is known about the behavior of glass, they have developed a multifaceted approach. They have numerically studied the stresses and deformations at the glass surface and immediately beneath the surface when a single abrasive particle indents it. In addition, they have performed scribing experiments, dragging one abrasive grit along the surface, subjecting the surface to water, and studying the cracking that results. To characterize the rate of grinding, they have developed a standardized test that utilizes the Preston Coefficient of Removal. They have observed that high-speed, fixed-abrasive ductile grinding is an order of magnitude less efficient than slow-speed lapping and polishing. Therefore, their efforts in FY 91 will focus on discovering why this occurs.

7032 (UCRL–53868-90, pp. 5.17-5.21) **Creep in fiber-reinforced epoxy-resin composites.** Feng, W.W. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors are investigating time-dependent deformation, or creep, in composite materials made of carbon fibers and epoxy resin. Predicting the rate of creep is important when composite structural components must retain precise tolerances. This year they have extended their analysis of creep to include additional models as well as aging effects in adverse environments. Their work provides fundamental tools for the advancement of dimensionally precise composite design in LLNL programs.

7033 (UCRL–53868-90, pp. 5.6-5.16) **Characterizing the failure of composite structures.** Groves, S.E.; Feng, W.W.; Sanchez, R.J. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors goal has been to characterize, with new experimental and theoretical methods, the three-dimensional failure response of continuous fiber composite materials. They succeeded with the primary objectives: develop both a multiaxial testing capability for continuous fiber composites using the axial/torsion/internal pressurization of tubes, and a new finite-strain-invariant failure criterion. They also completed the initial development of a specialized three-dimensional orthotropic finite element algorithm that will permit the required detailed stress/strain analysis for failure criterion evaluation. Concurrently they have also been investigating the dynamic behavior of composite materials.

7034 (UCRL-CR–105858-91-Summ.) **Development of low density silica aerogel as a capture medium for hyper-velocity particles: Summary report for FY 1991.** Hrubesh, L.W.; Poco, J.F. Lawrence Livermore National Lab., CA (United States). Oct 1991. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003971. Source: OSTI; NTIS; GPO Dep.

We have developed a method of bonding silica aerogel to various substrate materials including aluminum, silicon, glass, and other aerogels, using a silicon compound. The bonds are stronger than the aerogel, they are transparent, and they have very low off-gassing. We have also improved the transparency of silica aerogels by modifying the sol-gel chemistry that results in the gel. The new aerogels have about 15% higher transmission through the visible and 85% higher transmission between 250 and 330nm wavelengths, as compared with conventional silica aerogels. The ultraviolet cut-off wavelength of the aerogel can be varied as desired with our developed method.

7035 (UCRL-LR–106946) **Low-density carbonized resorcinol-formaldehyde foams: Final report.** Kong, F.M.; Buckley, S.R.; Giles, C.L. Jr.; Haendler, B.L.; Hair, L.M.; Letts, S.A.; Overturf, G.E. III; Price, C.W.; Cook, R.C. Lawrence Livermore National Lab., CA (United States). 4 Jul 1991. 58p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92004848. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents research and development on resorcinol-formaldehyde-based foam materials conducted between 1986 and June 1990, when the effort was discontinued. The foams discussed are resorcinol-formaldehyde (RF) foam, carbonized RF (CRF) foam, and two composite foams, a polystyrene/RF (PS/RF) foam and its carbonized derivative (CPR). The RF foams are synthesized by the polycondensation of resorcinol with formaldehyde in a slightly basic solution. Their structure and density depend strongly on the concentration of the sodium carbonate catalyst. The have an interconnected bead structure similar to that of silica aerogels; bead sizes range from 30 to 130 Å, and cell sizes are less than 0.1 μm. We have achieved densities of 16 to 200 mg/cm^3. The RF foams can be pyrolyzed in an inert atmosphere to form a vitreous carbon foam (CRF), which has a similar microstructure but much higher mechanical strength. The PS/RF foams are obtained by filling the 2- to 3-μm cells of PS foam (a low-density hydrocarbon foam we have developed) with RF. The resultant foams have the outstanding handling and machinability of the PS foam matrix and the small cell size of RF. Pyrolyzing PS/RF foams causes depolymerization and loss of the PS; the resulting CPR foams have a structure similar to the PS foams in which CRF both replicates and fills the PS cells.

7036 Synthesis of kenyaite-type layered silicate material and pillaring of said material. Valyocsik, E.W. To Mobil Oil Corp. (USA). 7 Aug 1991. Filed date 6 Feb 1990. Canada Patent patent application 2035444. 16p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $4.00 CAN; MF $2.75 CAN.

An improved, economical, and reproducible method is provided for preparing synthetic kenyaite-type layered crystalline silicate exhibiting high crystallinity and purity, catalytic activity, and other valuable properties. The starting mixture comprises sources of alkali metal cations (AM), silica, a non-alkali metal (M) of valence n, water, and an organic compound (R) selected from an alkylamine, a trialkylamine, a tetraalkylammonium compound, and trimethylhexamethylene diamine, the alkyl having 1-12 carbon atoms. The metal M may include any one or more of metals from Periodic Table Groups IVB, IIIA, VIB, IVA, and VIII. The mixture has a composition, in terms of mole ratios, within the following ranges: SiO_2/M_mO_n, at least ca 40; H_2O/SiO_2 5-200, $OH-/SiO_2$ 0-5, AM/SiO_2 0.05-3, R/SiO_2 0.01-3. The mixture is maintained under sufficient conditions to form crystals of the required silicate and the silicate crystals are then recovered. Experiments are described to illustrate the method of the invention. The silicate product of the invention is valuable as a catalyst component for various chemical conversion processes such as cracking, isomerization, hydrogenation, hydrogenolysis, conversion of oxygenates to other oxygenates or hydrocarbons, oxidation of alkanes, alkenes, and aromatics, and reactions of unsaturated hydrocarbons with carbon oxides. 1 fig., 4 tabs.

7037 (ANL–91/26) **Nuclear technology programs semiannual progress report, April–September 1989.** Harmon, J.E. (ed.). Argonne National Lab., IL (United States). Aug 1991. 261p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. Order Number DE92003358. Source: OSTI; NTIS; INIS; GPO Dep.

This document reports on the work done by the Nuclear Technology Program of the Chemical Technology Division, Argonne National Laboratory, in the period April–September 1989. These programs involve R&D in three areas: applied physical chemistry, separation science and technology, and nuclear waste management. The work in applied physical chemistry includes investigations into the processes that control the release and transport of fission products under accident-like conditions, the thermophysical properties of metal fuel and blanket materials of the Integral Fast Reactor, and the properties of selected materials in environments simulating those of fusion energy systems. In the area of separation science and technology, the bulk of the effort is concerned with developing and implementing processes for the removal and concentration of actinides from waste streams contaminated by transuranic elements. Another effort is concerned with developing a process for separating the organic and inorganic constitutents of the red-water waste stream generated in production of 2,4,6-trinitrotoluene. In the area of waste management, investigations are underway on the performance of materials in projected nuclear repository conditions to provide input to the licensing of the nation's high-level waste repositories. 154 refs., 154 figs., 100 tabs.

7038 (CNIC–00436) **Partition chromatographic separation-spectrometry for determination of 22 trace elements in $Pu(SO_4)_2 \cdot 4H_2O$.** Meng lanxiang (Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy); Zhang Qing; Feng Ainan; Gao Binghua; Ji Junying; Pan Chenlian. China Nuclear Information Centre, Beijing, BJ (China). Aug 1990. 10p. (In Chinese). (IAE–0081.). Order Number DE92613305. Source: OSTI; NTIS (US Sales Only); INIS.

The partition chromatographic separation-spectrometry for the determination of 22 trace elements in $Pu(SO_4)_2 \cdot 4H_2O$ is introduced. The 50 mg $Pu(SO_4)_2 \cdot 4H_2O$ was completely dissolved in the water-bath. In the column partition chromatography, the mixed extraction agent of TBP and TIOA(1:1) was used as stationary phase, PTFCE powder as support and 5 mol/L nitric acid as mobile phase. The trace elements to be determined were separated from 50 mg $Pu(SO_4)_2 \cdot 4H_2O$ and collected in the eluate. The lower content of Pu did not interfere in results, the indium was used as extra base and the indium and yttrium were used as internal standard elements. The 22 trace elements (AL, Be, B, Cd, Cr, Fe, Mn, Mg, Ni, P, Pb, Si, Ca, Cu, Co, Sc, Ti, V, Zn, Li, Na, K) were determined by two types of spectrographs using solution residue technique of electric arc. The range of determination of the trace elements is varied from 3×10^{-6}% to 2×10^{-2}%. The recovery of this method is varied from 83% to 120%, the precision of this method is within ±26%. 50mg $Pu(SO_4)_2 \cdot 4H_2O$ absorbed in the column can be desorbed by 5 mL 4 mol/L methanoic acid or 8mL mixed solution of 0.2 mol/L sulfuric acid and 0.1 mol/L nitric acid.

7039 (CNIC–00442) **Study of extraction-spectrophotometric micro-determination of boron with methylene blue and its application.** Zhu Daohong (Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy). China Nuclear Information Centre, Beijing, BJ (China). Aug 1990. 18p. (In Chinese). (IAE–0083.). Order Number DE92613306. Source: OSTI; NTIS (US Sales Only); INIS.

A sensitive extraction-spectrophotometric method for microdetermination of boron with methylene blue was investigated. The method was based on the extraction of a BF_4^--methylene blue complex into dichloroethane. Boron was determined directly by measuring the absorbance at 658 nm. The calibration graph was linear over the range of 2.5×10^{-9} to 8×10^{-8} g/mL. The blank, mechanism of the reactions, interference of other ions and some optimum conditions of the method were studied in detail. The main source of the blank resulted from methylene blue and the complex of F^--methylene blue. In order to reduce the blank, the amounts of methylene blue, H_2SO_4 and HF were used as less as possible. Only one to one complex BF_4^--methylene blue was formed in the medium of H_2SO_4. About 90% of methylene blue and F^--methylene blue complex was removed with 5 ml of water and only a little amount of BF_4-methylene blue complex was decomposed. The extraction-spectrophotometric method with methylene blue was first applied to the microdetermination of boron in sodium metal and UF_6. The sample of sodium metal was taken and weighed in the glovebox filled with argon. Then sodium metal was oxidized, hydrolyzed, netralized and fluorizated with H_2O, H_2SO_4 and HF, respectively. The 0.5 ppm of boron in sodium metal was determined with a relative error about ±4%. This method can be applied to the determination of boron in sodium metal, sodium sulfate and sodium hydroxide at different grades. The species of boron in the hydrolysate of UF_6 is BF_4^- anion, so the sample can be directly analyzed. Boron contents in the range of 0.1 to 0.5 ppm was determined with a relative error about ±3%. Six samples could be analysed in 2h.

7040 (CNIC–00452) **Determination of calcium in sodium by vacuum distillation-atomic absorption spectrophotometry.** Wen Ximeng (Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy); Su Shujuan; Sun Shiping; Liu Jingfang; Ding Dejun. China Nuclear Information Centre, Beijing, BJ (China). Nov 1990. 12p. (In Chinese). (IAE–0085.). Order Number DE92613307. Source: OSTI; NTIS (US Sales Only); INIS.

A method for determing calcium in sodium at 2 ppm or more is described. The matrix sodium was removed by vacuum distillation at 360 deg C and 5×10^{-3} Pa. The calcium in the residue was determined by atomic absorption spectrophotometry. The recovery rate of this method was satisfied in experiments of adding 2≈500 ppm calcium to 1≈4 grams of high purity sodium. The relative standard deviation was at 5.3%≈7.2%. The possible loss of calcium and its compound resulting from distillation had been investigated. The interference and suppressing methods were also studied.

7041 (CONF-9111129–4) **Detection of explosives material on single microparticles.** Whitten, W.B.; Dale, J.M.; Ramsey, J.M. Oak Ridge National Lab., TN (United States). [1991]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From FAA explosives detection symposium; Atlantic City, NJ (United States); 13-15 Nov 1991. Order Number DE92004408. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Some of the explosive materials with very low vapor pressure such as RDX or PETN are most likely to be encountered either as solids or adsorbed on solids. We are developing a new technique for the chemical characterization of explosives-bearing microparticles based upon the use of electrodynamic traps. Single microparticles are analyzed by laser ablation mass spectrometry in an ion trap detector. 8 refs., 2 figs.

7042 (DOE/ER/13463–8) **Novel macrocyclic carriers for proton-coupled liquid membrane transport: Progress report, 1 December 1988–31 May 1991.** Lamb, J.D. Brigham Young Univ., Provo, UT (United States). 10 Jun 1991. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER13463. Order Number DE92004045. Source: OSTI; NTIS; GPO Dep.

The objective of our research program is to elucidate the chemical principles which are responsible for the cation selectivity and permeability of liquid membranes containing macrocyclic carriers. Several new macrocyclic carriers were synthesized during the last three year period, including selenium-containing macrocycles, new crown-4 structures, and several new crown structures containing nitrogen based heterocycles as substituents in the principal macrocyclic ring. The cation binding properties of these macrocycles were investigated by potentiometric titration, calorimetric titration, solvent extraction, and NMR techniques. In addition, hydrophobic macrocycles were incorporated into dual hollow fiber membrane systems to investigate their membrane performance, especially in the proton-coupled transport mode. It was found that the dual hollow fiber system maintains the cation selectivity and permeability of supported liquid membranes, while enhancing membrane stability. The diffusion limited transport model was expanded to account for membrane solvent effects. Furthermore, Eu^{2+} transport was found to be similar to that of strontium and much higher than that of the lanthanides, in supported liquid membrane systems.

7043 (DOE/ER/13649–5) **Mechanisms of gas permeation through polymer membranes: Summary technical report, September 1989–August 1991.** Stern, S.A. Syracuse Univ., NY (United States). Dept. of Chemical Engineering and Materials Science. [1991]. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13649. Order Number DE92004423. Source: OSTI; NTIS; GPO Dep.

The objective of the present study is to investigate the mechanisms of gas transport in and through polymer membranes and the dependence of these mechanisms on pressure and temperature. This information is required for the development of new, energy-efficient membrane processes for the separation of industrial gas mixtures. Such processes are based on the selective permeation of the components of gas mixtures through nonporous polymer membranes. Recent work has been focused on the permeation of gases through membranes made from glassy polymers, i.e., at temperatures below the glass transition of the polymers (Tg). Glassy polymers are very useful membrane materials for gas separations because of their high selectivity toward different gases. Gases permeate through nonporous polymer membranes by a "solution-diffusion" process. Consequently, in order to understand the characteristics of this process it is necessary to investigate also the mechanisms of gas solution and diffusion in glassy polymers. 23 refs., 10 figs., 4 tabs.

7044 (DOE/ER/14056–10) **The influence of pressure on solute retention in liquid chromatography.** McGuffin, V.L.; Evans, C.E. Michigan State Univ., East Lansing, MI (United States). Dept. of Chemistry. [1991]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER14056. (CONF-9105293–1: International symposium on capillary chromatography, Riva del Garda (Italy), 13-16 May 1991). Order Number DE92004017. Source: OSTI; NTIS; GPO Dep.

In this investigation, multiple on-column detectors are utilized to measure the retention of model solutes directly on a packed, capillary column. The absolute pressure on the column is controlled using a restrictor at the column exit, while the pressure gradient and volumetric flowrate are maintained constant. Measurements obtained under reversed-phase conditions indicate that the local capacity factor changes considerably with local pressure under typical operating conditions. These results are somewhat surprising since the mobile-phase solvents used for liquid chromatography are generally considered to be incompressible.

7045 (DOE/ER/60648–4) **[Clusters: Elucidating the dynamics of ionization events and ensuing reactions in the condensed phase]: Brief summary of accomplishments.** Castleman, A.W. Jr. Pennsylvania State Univ., University Park, PA (United States). [1991]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER60648. Order Number DE92004416. Source: OSTI; NTIS; GPO Dep.

New insight into a variety of phenomena of interest in liquids have been derived from recent studies in our laboratory. In particular, new findings have contributed to identifying the structure of protonated complexes among species of varying proton affinities, and quantifying the variations in spectroscopic properties of chromophores as influenced by solvation and aggregation. 17 refs.

7046 (INIS-BR–2851) **Neptunium separation in trace levels from uranium solutions by extraction chromatography.** Figols, M.E.B. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). 1991 103p. (In Portuguese). Order Number DE92613318. Source: OSTI; NTIS (US Sales Only); INIS.

Neptunium and uranium behavior in extraction chromatography system, aiming the separation of microquantities of neptunium from uranyl nitrate solutions is described. Tri-n-octylamina (TOA), tri-n-butylphosphate (TBP), thenoyltrifluoroacetone (TTA) as stationary phase, alumina, Voltalef-UF-300, silica as support material were verified. The impregnation conditions as well as the best stationary phase/support material ratio were established. TBP/alumina, TBP/Voltalef and TOA/alumina system were selected to uranium and neptunium separation studies. In the system using TBP as extractant agent uranium and neptunium separation was reached by selective elution after the retention of both elements on the column. U-Np separation by selective retention of Np was possible with TOA system. The capacity of the column was the 66.6 mg U/mL and 191.6mg U/mL for the TBP/alumina and TBP/Voltalef systems, respectively. An application of extraction chromatography system in the final phase of irradiated uranium treatment process is proposed. (author).

7047 (INIS-mf–13025 vp.) **Methods for analysis of uranium-plutonium mixed fuel and transplutonium elements at RIAR (Preprint no. IT-25).** Timofeev, G.A. (V.I. Lenin Research Institute of Atomic Reactors, Dimitrovgrad (USSR)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. Feb 1991. 685p. Source: OSTI; NTIS (US Sales Only); INIS.

Analytical chemistry of plutonium encompasses different aspects e.g. solution chemistry, solid state chemistry, nuclear chemistry and methods for its determination. In this paper, the determination of plutonium which is one of the important aspects of analytical chemistry is dealt with. This involves the determination of isotopic composition and concentration/amount of plutonium at different levels in a variety of matrices. Because of its strategic importance, highly toxic nature, and also from the criticality point of view, sensitive, precise and accurate methods are essential. The selection of the method is governed by the type of matrix, the amount of plutonium present and the precision and accuracy requirements. This paper reviews the different methodologies available for these measurements with emphasis on the work performed in author's laboratory. (author). 40 refs.

7050 (INIS-mf–13065) **Fluorescence of UO_2^{2+} in different acidic media containing cationic and anionic impurities. Application to the elaboration of a very sensitive dosing method of Uranium in solution by fluorimetry and to the study of the kinetics of U-6 reduction by iron.** Belkadi, L. (Universite Mohammed 5, Rabat (Morocco). Faculte des Sciences). Universite Mohammed 5, Rabat (Morocco). Faculte des Sciences. Sep 1990 138p. (In French). Order Number DE92614750. Source: OSTI; NTIS (US Sales Only); INIS.

The use of the fluorimetric analysis method in phosphoric medium proved that this method is very sensitive for detecting Uranium traces (10 E-10 M). The dosing can be carried out after a simple calibration of the device and without calling for the addition techniques. The interference of most organic matters is eliminated by the 337 nm exciting radiation. The inhibition of the fluorescence induced by anions and cations is generally resolved by a simple dilution. The nitrates that have a harmful effect on the Uranium fluorescence have been eliminated by successive evaporations. This method, as it has been improved in this work, is applied to the study of U-6 reduction by metallic Iron and Fe-2 in orthophosphoric acid medium in case the absorption spectrophotometry becomes inoperative. 37 figs., 14 tabs., 50 refs. (author).

7051 (IPEN-PUB–340) **Isotopic analysis of boron by thermal ionization mass spectrometry.** Kakazu, M.H.; Sarkis, J.E.S.; Souza, I.M.S. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). Jul 1991. 32p. (In Portuguese). Order Number DE92613308. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents a methodology for isotopic analysis of boron by thermal ionization mass spectrometry technique through the ion intensity measurement of $Na_2BO^+_2$ in H_3BO_3, B^o and B_4C. The samples were loaded on single tantalum filaments by different methods. In the case of H_3BO_3, the method of neutralization with NaOH was used. For B_4C the alcaline fusion with Na_2CO_3 and for B^o dissolution with 1:1 nitric sulfuric acid mixture followed by neutralization with NaOH was used. The isotopic ratio measurements were obtained by the use of s Faraday cup detector with external precision of ±0,4% and accuracy of ±0,1%, relative to H_3BO_3 isotopic standard NBS 951. The effects of isotopic fractionation was studied in function of the time during the analyses and the different chemical forms of deposition. (author).

7052 (IS-T–1605) **New chelating reagents for preconcentration, separation, determination of metal complexes by high performance liquid chromatography and solid phase extraction.** Qian, Yan wen. Ames Lab., IA (United States). 3 Dec 1991. 60p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE92005153. Source: OSTI; NTIS; GPO Dep.

A general scheme is outlined for rapid determination of metal cations by complexation and subsequent HPLC separation. The synthesis and general properties are described for several new thiohydrazone chelating reagents. Solubility considerations suggest that the metal complexes have a positive charge. Excellent chromatographic separations are obtained for mixtures of up to seven metal complexes. Addition of a positively charged additive to the eluent is shown to have a significant effect on both the retention times and sharpness of the chromatographic peaks. Separation of the metal complexes on resins with a permanent charge is also shown to be feasible. Two new hydrazone reagents have been synthesized and characterized. Trace metal ions in aqueous solution are complexed by one of the hydrazones and the resulting metal complexes are solid phase extracted onto a mini cation-exchange or polymeric column. The uptake of metal complexes is complete and the elution step is fast and complete. The quantitative recoveries of metal ions determined by both spectrophotometric method and ICP-MS are very satisfactory and agree with each other.

7053 (KAERI-II/RR–11/90) **Basic chemistry for radioactive waste management: Development of chemical methods on geological material analysis.** Eom, Tae Yoon (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Suh, Moo Yul; Joe, Kih Soo; Chung, Yong Sam; Kim, Jung Suk; Sohn, Se Chul; Han, Sun Ho; Jee, Kwang Yong; Choi, Kwang Soon; Lee, Chang Heon. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Mar 1991. 146p. (In Korean). Order Number DE92614572. Source: OSTI; NTIS (US Sales Only); INIS.

Chemical analysis methods on geological materials were investigated for the evaluation of radioactive waste disposal site, and the scope and contents weer as follows: -Determination of the major and trace elements in granite rocks by ICP-AES and INAA: Experimental conditions of ICP-AES and INAA were established with geological standard rock, USGS-G2. The ICP-AES was found to be better both in precision and in accuracy than the INAA for major elements. The precision and the accuracy of the ICP-AES method were about 6% and +/- 10%, respectively. -Determination of inorganic and organic anions by ion chromatography and prediction of retention times : Analytical methods for inorganic anions was established with NaOH eluents by ion chromatography. Studies on the prediction of retention times of the anions for gradient elution was carried out using the stepwise elution equation. The slope from the plot of log K' against log $[OH^-]$ was obtained by a linear regression, and a good agreement was obtained between the experimental and the calculated values. -Development of analytical methods for the determination of Co, Ni and In by differential-pulse adsorptive stripping voltametry and ferrous and ferric ions by spectrometry : Detection limits of Co, Ni and In were 0.02, 0.05 and 0.2 ppb, respectively, and the content of ferrous and ferric ion in KAERI ground water were 0.12 and 0.08 ppm respectively. -Determination of trace uranium in groundwaters by neutron activation analysis : Uranium in KAERI groundwater was preconcentrated on the chelating resin, Chelex-100 and the uranium content was measured by neutron activation analysis. The analytical result was 4.5 ppb with standard deviation of 0.049. (Author).

7054 (MAFF-AEPAM–7) **The determination of alpha-emitting nuclides of plutonium, americium and curium in environmental materials: Pt. 1: Sea water.** Lovett, M.B.; Boggis, S.J.; Blowers, P. Ministry of Agriculture, Fisheries and Food, Lowestoft (United Kingdom). Directorate of Fisheries Research. 1990. 36p. Order Number DE92614732. Source: OSTI; NTIS (US Sales Only); INIS.

Within the Aquatic Environment Protection Division of the Directorate of Fisheries Research (DFR), the Radioanalytical Group routinely analyses a wide range of environmental materials for a substantial number of radionuclides. A wide variety of radiochemical procedures have been developed at different laboratories but there are no 'standard' methods because the methods are continually developing. Nevertheless, it is useful, as in this present series, periodically to draw together the methods which are in routine use at a laboratory and to discuss their development and application. (author).

7055 (ORNL/M–1223) **Analytical mass spectrometry: Abstracts.** Oak Ridge National Lab., TN (United States). [1990]. 53p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (CONF-900725–Absts.: 43. annual summer symposium on analytical chemistry, Oak Ridge, TN (United States), 24-27 Jul 1990). Order Number DE92004043. Source: OSTI; NTIS; GPO Dep.

This 43rd Annual Summer Symposium on Analytical Chemistry was held July 24–27, 1990 at Oak Ridge, TN and contained sessions on the following topics: Fundamentals of Analytical Mass Spectrometry (MS), MS in the National Laboratories, Lasers and Fourier Transform Methods, Future of MS, New Ionization and LC/MS Methods, and an extra session. (WET)

7056 **A backscattering spectrometry device for identifying unknown elements present in a workpiece.** Doyle, B.L.; Knapp, J.A. To Dept. of Energy. 1990. Filed date 30 May 1990. USA Patent patent application 7-530,672. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004621. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a backscattering spectrometry method and device for identifying and quantifying impurities in a workpiece during processing and manufacturing of that workpiece. While the workpiece is implanted with an ion beam, that same ion beam backscatters resulting from collisions with known atoms and with impurities within the workpiece. Those ions backscatter along a predetermined scattering angle and are filtered using a self-supporting filter to stop the ions with a lower energy because they collided with the known atoms of the workpiece of a smaller mass. Those ions which pass through the filter have a greater energy resulting from impact with impurities having a greater mass than the known atoms of the workpiece. A detector counts the number and measures the energy of the ions which pass through the filter. From the energy determination and knowledge of the scattering angle, a mass calculation determines the identity, and from the number and solid angle of the scattering angle, a relative concentration of the impurity is obtained.

7057 **Apparatus and method for separating constituents.** Maronde, C.P.; Killmeyer, R.P. Jr. To Dept. of Energy. 1990. Filed date 25 Jun 1990. USA Patent patent application. 25p. Sponsored by U.S. DOE Fossil Energy. Order Number DE92003814. Source: OSTI; NTIS; GPO Dep.

A centrifugal separator apparatus and method for improving the efficiency of the separation of constituents in a fluid stream. A cyclone separator includes an assembly for separately discharging both constituents through the same end of the separator housing. A rotary separator includes a rotary housing having a baffle disposed therein for minimizing the differential rotational velocities of the constituents in the housing, thereby decreasing turbulence, and increasing efficiency. The intensity of the centrifugal force and the time which the constituents reside within the housing can be independently controlled to improve efficiency of separation. 4 figs.

7058 (POEF-T-3581-Extd.Abst.) **Determination of uranium and uranium isotopes in mixed and radioactive wastes by inductively coupled plasma-mass spectrometry.** Taphorn, J.E.; Mayfield, K.C.; Vita, O.A. Portsmouth Gaseous Diffusion Plant, OH (United States). 2 Dec 1991. 4p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-76OR00001. (CONF-920302-1-Extd.Abst.: 43. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, New Orleans, LA (United States), 9-13 Mar 1992). Order Number DE92003981. Source: OSTI; NTIS; INIS; GPO Dep.

This work reports on the efforts to develop methods for sample dissolution and chemical separation, as well as analytical methodology for the analysis of both total uranium and its isotopes in differing waste sample matrices.

7059 (SAND-91-8703) **Infrared degenerate four-wave mixing as a diagnostic.** Vander Wal, R.L. (Sandia National Labs., Livermore, CA (United States)); Farrow, R.L.; Rakestraw, D.J.; Holmes, B.E.; Jeffries, J.B.; Danehy, P.M. Sandia National Labs., Livermore, CA (United States). [1991]. 4p. Sponsored by U.S. DOE Conservation & Renewable Energy; U.S. DOE Energy Research. DOE Contract AC04-76DR00789. Order Number DE92005331. Source: OSTI; NTIS; GPO Dep.

We are currently exploiting the recently realized spectroscopic capabilities of degenerate four-wave mixing (DFWM) to probe key combustion species by employing infrared rovibrational transitions to achieve resonant enhancement.

7060 (UCRL-CR-108120) **Enhancing sample preparation capabilities for accelerator mass spectrometry radiocarbon and radiocalcium studies.** Taylor, R.E. (California Univ., Riverside, CA (United States)). Lawrence Livermore National Lab., CA (United States); California Univ., Riverside, CA (United States). 20 Aug 1991. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003966. Source: OSTI; NTIS; INIS; GPO Dep.

With support provided by the LLNL Accelerator Mass Spectrometry Laboratory, the UCR Radiocarbon Laboratory continued its studies involving sample pretreatment and target preparation for both AMS radiocarbon (^{14}C) and radiocalcium (^{41}Ca) involving applications to archaeologically – and paleoanthropologically- related samples. With regard to AMS ^{14}C-related studies, we have extended the development of a series of procedures which have, as their initial goal, the capability to combust several hundred microgram amounts of a chemically-pretreated organic sample and convert the resultant CO_2 to graphitic carbon which will consistently yield relatively high $^{13}C^-$ ion currents and blanks which will yield, on a consistent basis, ^{14}C count rates at or below 0.20% modern, giving an 2 sigma age limit of >50,000 yr BP.

7061 (ZfK-746) **Construction and testing of probes for oxygen measurement in steel melts.** Richter, W. (Zentralinstitut fuer Kernforschung, Rossendorf (Germany)); Zitzmann, H.; Ullmann, H.; Kirchhoff, H. Zentralinstitut fuer Kernforschung, Rossendorf (Germany). Jul 1991. 30p. (In German). Order Number DE92750166. Source: OSTI; NTIS (US Sales Only).

The Central Institute of Nuclear Research (ZfK) Rossendorf developed oxygen probes for measurements in steel melts in cooperation with industrial plants and participated in their production and testing. The steps of investigation and development of the oxygen probes were development of ceramics, assembling of the sensor, and manufacturing of oxygen probes. In the result of the development a MgPSZ-ceramics was obtained which met all requirements for application in steel melts (strength, thermal shock resistence). The reference mixture applicated in this sensor distinguishes by a rapid potential formation. The oxygen sensors were tested in laboratory melts whereas the complete oxygen probes were operated in steel plants. The general measuring behaviour of the sensors could be demonstrated in the laboratory tests. The quantitative determination of the measuring parameters was obtained by comparative measurements in steel plants. The determination of high oxygen activities causes no troubles and the standard deviation of the cell voltage was within a ±6 mV range. At lower oxygen activities the measurements showed greater differences and require further improvement. (orig.).

7062 (ANL/CP-72789) **Oxo chemistry in supercritical carbon dioxide.** Krause, T.R.; Rathke, J.W.; Klingler, R.J. Argonne National Lab., IL (United States). [1991]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-911133-9: American Institute of Chemical Engineers (AIChE) annual meeting, Los Angeles, CA (United States), 17-22 Nov 1991). Order Number DE92004128. Source: OSTI; NTIS; GPO Dep.

We report an investigation of the cobalt carbonyl-catalyzed oxo process in supercritical CO_2 using in situ high pressure NMR spectroscopy. The use of supercritical CO_2 as the solvent medium eliminates gas-liquid mixing problems. The effect of supercritical CO_2 on the oxo reaction was determined by comparing the linear to branched aldehyde yield and rate and other equilibrium processes involved in the catalytic cycle with measured values in conventional liquid solvents.

7063 (ANL/CP-73404) **Structures and stabilities of trivalent and tetravalent rare earth ions in sevenfold and eightfold coordination in fluorite-related complex oxides.** Morss, L.R. Argonne National Lab., IL (United States). [1991]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-911109-6: Fall meeting of the European Materials Research Society, Strasbourg (France), 5-8 Nov 1991). Order Number DE92005237. Source: OSTI; NTIS; GPO Dep.

This paper reports the preparation and characterization of a series of oxides containing 3+ or 4+ lanthanide (M = Ce, Pr, or Tb) ions, with different ionic sizes and varying M^{4+}/M^{3+} reduction potentials, in nearly cubic coordination. The objective of the study was to demonstrate how oxidation-reduction characteristics and ionic size trends explain the properties of these oxides and to compare the oxidation-reduction stability of M^{3+} and M^{4+} lanthanide ions in high (CN 7 or 8) coordination in fluorite-related oxides versus low (CN 6) coordination in perovskite oxides. Efficient preparative methods are reported, as well as powder diffraction and thermogravimetric measurements for oxides $CaMTi_2O_{7-x}$ and $CaMZr_2O_{7-x}$. These oxides were characterized by X-ray powder diffraction and by thermogravimetric analysis. $CaCeTi_2O_7$ is a pyrochlore, a = 10.142(4) Å, with Ce^{4+} much more easily reducible than in the perovskite $BaCeO_3$. By contrast, a preparation with the stoichiometry "$CaPbTi_2O_{7-x}$" is a two-phase mixture-of perovskite $CaTiCo_3$ and a presumably Pr^{3+}-rich pyrochlore $Pr_2Ti_2O_7$(?). $CaTbTi_2O_{7-x}$ appears to be a Tb^{3+} pyrochlore, a = 10.149(2) Å. $CaCeZr_2O_7$ is a pyrochlore, a = 10.524(1) Å. A preparation of "$CaPbZr_2O_{7-x}$" also appeared to yield a two-phase mixture, perovskite $CaZrO_3$ and pyrochlore $Pr_2Zr_2O_7$. In this paper, the structures, f-element ion sites, and M(4)-M(3) stability trends in the $CaMTi_2O_{7-x}$ and $CaMZr_2O_{7-x}$ oxides are compared with the structural and stability trends in the perovskites $BaMO_3$ which have M^{4+} ions in sixfold (tilted octahedra) coordination.

7064 (ANL/CP–74763) **Enthalpies of formation of rare earths and actinide(III) hydroxides: Their acid-base relationships and estimation of their thermodynamic properties.** Morss, L.R.; Williams, C.W. Argonne National Lab., IL (United States). [1991]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-911109–7: Fall meeting of the European Materials Research Society, Strasbourg (France), 5-8 Nov 1991). Order Number DE92005235. Source: OSTI; NTIS; GPO Dep.

This paper reviews the literature on rare earth(III) and actinide(III) hydroxide thermodynamics, in particular the determination of their enthalpies of formation at 25°C. The hydroxide unit-cell volumes, lanthanide/actinide ion sizes, and solid-solution stability trends have been correlated with a generalized acid-base strength model for oxides to estimate properties for heterogeneous equilibria that are relevant to nuclear waste modeling and to characterization of potential actinide environmental interactions. Enthalpies of formation and solubility-product constants of actinide(III) hydroxides are estimated.

7065 (BNL–47044) **Rotationally resolved threshold photoionization of H_2S.** Wiedmann, R.T.; White, M.G. Brookhaven National Lab., Upton, NY (United States). [1991]. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-920124–2: Society of Photo-Optical Instrumentation Engineers' international symposium on laser spectroscopy as part of SPIE's symposium on optics, electro-optics and laser applications in science and engineering, Los Angeles, CA (United States), 19 Order Number DE92005046. Source: OSTI; NTIS; INIS; GPO Dep.

With the recent development of zero kinetic energy threshold photoelectron spectroscopy (ZEKE-PES) it is now possible to take advantage of the high resolution capabilities of laser radiation and measure the rotational distributions of many small cations produced via photoionization. We have used threshold photoelectron spectroscopy in conjunction with a VUV laser source to probe the rotational distributions of several molecular cations following one-photon VUV photoionization. Spectra are obtained by the delayed, pulsed field ionization (PFI) method which is a variant of the ZEKE-PES technique. In this paper, we report on the rotationally-resolved threshold photoelectron spectra of the non-linear triatomic H_2S. These measurements are an extension of our earlier study on H_2O which provided the first look at the symmetry properties of allowed rotational transitions in the photoionization of non-linear molecules.

7066 (CONF-911270–1) **Project summary: Physical chemistry of geothermal systems.** Mesmer, R.E.; Cole, D.R.; Holmes, H.F.; Palmer, D.A.; Simonson, J.M.; Wesolowski, D.J. Oak Ridge National Lab., TN (United States). [1991]. 25p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From Geothermal energy peer review; Salt Lake City, UT (United States); 4 Dec 1991. Order Number DE92004342. Source: OSTI; NTIS; GPO Dep.

We have completed solubility studies on gibbsite to 100°C in several electrolyte media and derived speciation of Al^{3+} in solution; defined the ionization constant for HSO_4 at 250°C in brine compositions to 5 molal and completed measurements of the ion-interaction parameters for $NaHSO_4$(aq) to 250°C; measured volatility of HCl over aqueous HCl to 350°C and applied derived model to the conditions of the Geysers; and completed measurements of the effects of NaCl and KCl on D/H and $^{18}O/^{16}O$ liquid-vapor partitioning are complete to 100°C and to 6 molal. Studies on the effects of $MgCl_2$ and $CaCl_2$ and their mixtures are underway.

7067 (DOE/ER/13323–6) **Highly nucleophilic acetylide, vinyl, and vinylidene complexes: Progress report.** Pennsylvania State Univ., University Park, PA (United States). Dept. of Chemistry. 1 Aug 1991. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER13323. Order Number DE92003751. Source: OSTI; NTIS; GPO Dep.

In the past year we have completed our studies of the halide-promoted carbonylation of imido ligands, extended our explorations of Cp(CO)(L)Mn-X complexes which possess highly reactive acetylide, vinylidene, carbyne, and vinylcarbyne ligands, and have briefly investigated the formation of bimetallic complexes using anionic carbene complexes. 5 figs.

7068 (DOE/ER/13507–7) **Synthesis and analysis of novel polymers with high permselectivity and permeability in gas separation applications: Progress report, December 1990–November 1991.** Koros, W.J.; Paul, D.R. Texas Univ., Austin, TX (United States). Dept. of Chemical Engineering. 15 Nov 1991. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER13507. Order Number DE92004057. Source: OSTI; NTIS; GPO Dep.

We have synthesized and completed characterization of permeability and selectivity properties of a group of polysulfones and polyether ketones with the potential for higher use temperatures, as well as members of a series of polyesters derived from spirobiindane bisphenol monomer in conjunction with meta and para substituted diacid chlorides. We have also synthesized and characterized the gas transport and thermal properties of diphenyl substituted polyphenylene oxide. The diphenyl substituted material has a potential for higher temperature applications than the standard dimethyl substituted polymer. The temperature dependence of the gas transport properties for the oxygen/nitrogen system was characterized over the range from 35 to 65°C for both of these analog materials.

7069 (DOE/ER/13514–T1) **Synthesis and chemistry of yttrium and lanthanide metal complexes: Progress report, March 15, 1991–March 14, 1992.** Evans, W.J. California Univ., Irvine, CA (United States). Dept. of Chemistry. Sep 1991. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-86ER13514. Order Number DE92003767. Source: OSTI; NTIS; GPO Dep.

The objective of this research project is to determine the special features of complexes of yttrium and the lanthanide metals which will allow the design and synthesis of materials with unique chemical, physical, and catalytic properties. Past studies of yttrium and lanthanide metal alkyl and hydride complexes stabilized by cyclopentadienyl co-ligands have shown that a substantial, often singular, organometallic chemistry is available via these metals. More extensive utilization of the chemical opportunities available through yttrium and the lanthanides would be possible, however, if stabilizing ancillary ligand systems less sensitive to oxidation and protonolysis than cyclopentadienides could be developed. Alkoxide ligands are attractive in this regard and our recent research had focused on alkoxides and the special opportunities they can provide to these metals. 6 refs., 10 figs.

7070 (DOE/ER/13766–9) **Reactions of metal ions and their clusters in the gas phase using laser ionization–Fourier transform mass spectrometry: Progress report, February 1, 1990–January 31, 1991.** Freiser, B.S. Purdue Univ., Lafayette, IN (United States). Dept. of Chemistry. Sep 1990. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13766. Order Number DE92005340. Source: OSTI; NTIS; GPO Dep.

Carbon clusters of the form C_N^- are observed at least out to N = 30 confirming that cluster formation is occurring in the high pressure "waiting room" of the supersonic cluster source. This can be stated unequivocally, since only up to N = 13 is observed by direct laser desorption of a carbon target in the absence of supersonic expansion. Currently underway is a systematic investigation of a wide variety of M^+-C_nH_{2n} species with n = 2–10 and M = first and second row transition metal ions. In addition we will shortly apply this methodology to doubly charged ions and metal cluster ions. All indications are that this area will be highly productive.

7071 (DOE/ER/13775–4) **[Comparison of group transfer, inner shere and outer sphere electron transfer mechanisms for organometallic complexes]: Summary.** State Univ. of New York, Buffalo, NY (United States). [1991]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13775. Order Number DE92004068. Source: OSTI; NTIS; GPO Dep.

Our studies of reactions of metal carbonyl cations and anions have shown that metal carbonyl cations can catalyze CO exchange reactions on metal carbonyl anions. This result provides further evidence for a mechanism involving attack of the metal carbonyl anion on a carbon of the metal carbonyl cation in CO^{2+} transfer reactions. Reaction of metal carbonyl anions with metal carbonyl halides is a common approach to formation of metal-metal bonds. We have begun to use kinetic data and product analysis to understand the formation of homobimetallic versus heterobimetallic products in such reactions. Initial data indicate a nucleophilic attack, possibly through a ring-slippage mechanism.

7072 (DOE/ER/13809–T1) **Investigations of charge-separation processes in metal complexes: Performance report.** Crosby, G.A. Washington State Univ., Pullman, WA (United States). 18 Feb 1991. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-87ER13809. Order Number DE92004327. Source: OSTI; NTIS; GPO Dep.

The major thrust of the research has been the quantification of the excited states of inorganic complexes that display potential for mediating charge-separation processes. Investigations of copper(1) mixed-ligand complexes have been completed. Non-equilibrated emitting states have been assigned. Chemical tuning of the emission energy by modifying the basicity of the donor ligand on the metal has been achieved. Structure-property relationships have been defined for crystalline complexes of zinc containing both diimine and monothiol ligands. Correlation of the spectral shifts with the rotations of the thiol phenyl rings in different crystal phases has been shown by comparing with extended Huckel calculations and x-ray structures. Complexes of zinc containing diimine and dithiol ligands are shown to be polynuclear species. A trinuclear species can be forced to assume a binuclear structure by incorporating other non-coordinating ligands into the lattice. The transformation is accompanied by substantial photophysical changes. Syntheses and x-ray structure determinations of platinum(2) complexes containing diimine ligands only, both diimine and dithiol ligands, and dithiol ligands only have been completed. An unusual platinum(3) bis(dithiol) species has been obtained and its structure determined. Investigations of the emission spectra of bis(bipyridine)platinum(2) have revealed the existence of multiple emitting states with both ligand-localized and charge- transfer characteristics.

7073 (DOE/ER/13855–5) **Preparation of polymer-modified electrodes: A literature and experimental study.** Jayanta, P.S.; Ishida, Takanobu. State Univ. of New York, Stony Brook, NY (United States). Dept. of Chemistry. May 1991. 99p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER13855. Order Number DE92005304. Source: OSTI; NTIS; GPO Dep.

Thesis submitted by Pat Siripastr Jayanta.

A literature review is presented on the field of polymer modified electrodes which can be electrochemically generated. It is suggested that a possible application of these polymer modified electrodes is as a regeneratable catalysis packing material for use in couter-current exchange columns. Secondly, there is a presentation of experimental results dealing with possible electrode modification using difluoro- and dimethyl- phenols and fluorinated derivatives of styrene, benzoquinone and hydroquinone. It appears that dimethylphenol shows the most potential of the monomers experimentally tested in providing a stable polymer modified electrode surface. 170 refs., 31 figs., 1 tab.

7074 (DOE/ER/13880–4) **Late transition metal oxo and imido complexes: Progress report, May 15, 1991–May 14, 1992.** Sharp, P.R. Missouri Univ., Columbia, MO (United States). Dec 1991. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER13880. Order Number DE92005079. Source: OSTI; NTIS; GPO Dep.

Novel, electrophilic ring addition reactions and oxidative ring coupling reactions have been discovered for aryl-imido A-frame rhodium complexes. Probable transient radical intermediates are produced and detected by electrochemical oxidation. The $[L_2PtO]_2$ class of dioxo complexes has been expanded to include the chelating ligands, $L_2 = Ph_2P(CH_2)_nPPh_2$ (n=1–4). $[(Ph_2P(CH_2)_nPPh_2)PtO]_2$ shows the greatest reactivity suggesting a dependence on the P-Pt-P angle. Mixed-metal complexes where the oxo groups in $[L_2PtO]_2$ are used as ligands for other metals have been prepared and show a dramatic cooperative effect in their reactions with carbon monoxide. New hydrazido complexes of Au(I) have been prepared. Their decompositions provide new routes and mechanistic insight into the formation of gold clusters.

7075 (DOE/ER/13935–3) **Synthesis and chemistry of cationic d^0 metal alkyl complexes: Progress report, July 1988–May 1991.** Jordan, R.F. Iowa Univ., Iowa City, IA (United States). Dept. of Chemistry. [1991]. 29p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER13935. Order Number DE92005300. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to develop new types of electrophilic metal alkyl complexes for catalytic C-H activation and olefin polymerization chemistry, and associated fundamental mechanistic studies. We have focused our efforts on four classes of early metal alkyl complexes: (1) cationic group 4 $Cp_2M(R)^+$ complexes (1) which are active species in Cp_2MX_2-based Ziegler-Natta olefin polymerization catalyst systems and which catalyze productive C-H activation reactions of heterocycles, (2) neutral (dicarbollide)(Cp*)M(R) complexes (2) which are structurally are electronically very similar to 1, (3) half-sandwich complexes $CpM(R)_2(L)_n^+$ which are highly coordinatively and electronically unsaturated, and (4) new group 5 (dicarbollide)(Cp)MR_2 and $(dicarbollide)_2$ MR complexes which are more unsaturated than group 5 Cp_2M systems due to incorporation of the dicarbollide ligand.

7076 (DOE/ER/13945–3) **High temperature chemistry of aromatic hydrocarbons.** Scott, L.T. Nevada Univ., Reno, NV (United States). [1991]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract FG08-88ER13945. Order Number DE92005305. Source: OSTI; NTIS; GPO Dep.

We have not only gained new insight into the mechanism and generality of Polycyclic Aromatic Hydrocarbon (PAH) thermal automerization reactions, we have also uncovered several new high temperature reactions and added a third dimension to our program by applying high temperature chemistry to problems in organic synthesis. Our synthesis of corannulene has attracted much recent attention; however, we believe that the uncatalyzed "cyclodehydrogenation reactions" which form 5-membered rings and 6-membered rings at high temperatures may prove to be of greater general importance in the long term. This bias is reflected in the accompanying proposal.

7077 (DOE/ER/14117–T1) **Chemistry of bimetallic and alloy surfaces: Progress report, June 1, 1990–November 30, 1991.** Koel, B.E. University of Southern California, Los Angeles, CA (United States). Dept. of Chemistry. 18 Oct 1991. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-90ER14117. Order Number DE92003762. Source: OSTI; NTIS; GPO Dep.

In the first funding period, we continued our work on elucidating the underlying principles that govern chemical reactions occurring on bimetallic and alloy surfaces. Our goal is to aid in the atomic level explanation of the reactivity and selectivity of alloy and bimetallic cluster catalysts and to provide a fundamental basis for the design of new catalysts with improved performance. Our approach is to use a battery of surface science methods to obtain fundamental data on the thermochemistry and kinetics of the adsorption and reaction of molecules on extensively characterized, single-crystal bimetallic surfaces. We measure changes in chemisorption bond strengths, adsorption site distributions, and hydrocarbon fragment stability and reactivity and correlate these results with the geometric and electronic structure of the metal atoms on the surface. Often, our aim is to carefully design experiments that isolate the several factors (e.g., ensemble and ligand effects) that control surface chemistry and catalysis on bimetallic and alloy surfaces in order to better understand the importance of each contribution. Some of the highlights and noteworthy accomplishments made during the first period of this grant are given.

7078 (DOE/ER/14117–T2) **Chemistry of bimetallic and alloys surfaces: Progress report, June 1, 1990–November 30, 1991.** Koel, B.E. University of Southern California, Los Angeles, CA (United States). Dept. of Chemistry. 18 Oct 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-90ER14117. Order Number DE92004337. Source: OSTI; NTIS; GPO Dep.

We have continued our work on elucidating the underlying principles that govern chemical reactions occurring on bimetallic and alloy surfaces. Our goal is to aid in the atomic level explanation of the reactivity and selectivity of alloy and bimetallic cluster catalysts and to provide a fundamental basis for the design of new catalysts with improved performance. Our approach is to use a battery of surface science methods to obtain fundamental data on the thermochemistry and kinetics of the adsorption and reaction of molecules on extensively characterized, single-crystal bimetallic surfaces. We measure changes in chemisorption bond strength, adsorption site distributions, and hydrocarbon fragment stability and reactivity and correlate these results with the geometric and electronic structure of the metal atoms on the surface. Often, our aim is to carefully design experiments that isolate the several factors (e.g., ensemble and ligand effects) that control surface chemistry and catalysis on bimetallic and alloy surfaces in order to better understand the importance of each contribution. In the past 18 months, we have continued to study how alkali promoters strongly affect the reactions of hydrocarbons on Pt and Ni surfaces by altering the electronic structure and inducing significant site-blocking effects. We have shown that bismuth coadsorption provides benchmark data on ensemble sizes required for chemical reactions on Pt and Ni surfaces. Surface alloys of Sn/Pt are being used for detailed probing of ensemble sizes and also reactive site requirements. 22 refs.

7079 (ECN-RX-91-005) **The vapour pressure of UCl_4.** Cordfunke, E.H.P. (Netherlands Energy Research Foundation, Petten (Netherlands)); Konings, R.J.M. Netherlands Energy Research Foundation, Petten (Netherlands). Jan 1991. 9p. Order Number DE92613385. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted for publication to the Journal of chemical thermodynamics.

A third-law analysis of the results of measurements of the vapour pressure of UCl_4 shows good agreement between the enthalpies of sublimation from effusion studies, but that other techniques, like transpiration, boiling point or static measurements, give somewhat lower enthalpies of sublimation. In order to resolve this discrepancy the results of a vapour study of uranium tetrachloride by the transpiration technique are reported. (author). 16 refs.; 1 fig.; 2 tabs.

7080 (IC–91/249) **Thermodynamic functions of ethylgermane and ethylsilane from spectroscopic data.** Pandey, A.N. (International Centre for Theoretical Physics, Trieste (Italy)); Bhardwaj, S. International Centre for Theoretical Physics, Trieste (Italy). Aug 1991. 6p. Order Number DE92613323. Source: OSTI; NTIS (US Sales Only); INIS.

The thermodynamic functions - heat capacity, heat content, free energy and entropy have been calculated for two molecules, $CH_3CH_2GeH_3$ and $CH_3CH_2SiH_3$ in the temperature range 5 1/2 - 2000 deg. K at one atmosphere pressure in the ideal gas state by vibrational frequencies and molecular parameters. A rigid rotator harmonic oscillator model is assumed for the two molecules with C_s point group. (author). 4 refs, 3 tabs.

7081 (INIS-mf–13025 vp.) **Recent advances in the thermodynamics of trivalent actinides (Preprint no. IT-08).** David, F. (Institute de Physique Nucleaire, Orsay (France)). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. Feb 1991. 685p. (CONF-9102132–: International symposium on radiochemistry and radiation chemistry - plutonium 50, Bombay (India), 4-7 Feb 1991). In *International symposium on radiochemistry and radiation chemistry (Plutonium - 50 years) (held at Bombay during February 4-7, 1991): Preprints volume.* Order Number DE92001334. Source: OSTI; NTIS (US Sales Only); INIS.

The structure of the trivalent lanthanide and actinide aqua ions has been investigated through radiochemical methods. It is observed that the size of the aqua ions are larger for actinides than for lanthanides with the same crystallographic radii R_c. Hydration numbers N and H corresponding to the primary and second sphere have been deduced. In both series N is varying discontinously with R_c, and the discontinuity corresponds to a greater radius for actinides than for lanthanides. These two differences have been related to shorter cation-water distance and covalency in the actinide series. These informations have been used to improve author's previous hydration model. Gibbs energies are calculated for spheric monovalent, divalent and trivalent ions. Deviations between experimental and calculated data are less than 0.6%. The model allows evaluation of the covalency effect in the actinide series. A model to evaluate entropies of trivalent lanthanide and actinide aquo ions is proposed. (author). 46 refs.

7082 (INIS-mf–13025 vp.) **Some aspects of solution chemistry of plutonium (Preprint no. IT-11).** Patil, S.K. (Bhabha Atomic Research Centre, Bombay (India). Fuel Chemistry Division). Department of Atomic Energy, Bombay (India). Board of Research in Nuclear Sciences. Feb 1991. 685p. (CONF-9102132–: International symposium on radiochemistry and radiation chemistry - plutonium 50, Bombay (India), 4-7 Feb 1991). In *International symposium on radiochemistry and radiation chemistry (Plutonium - 50 years) (held at Bombay during February 4-7, 1991): Preprints volume.* Order Number DE92001334. Source: OSTI; NTIS (US Sales Only); INIS.

An attempt has been made to review some aspects of solution chemistry of plutonium. (author). 31 refs., 2 tabs.

7083 (INIS-mf–13082) **Chemical, structural and magnetic studies of new mono- and diphosphates appearing in ternary diagrams AO-CuO-(P_2O_5); A= Mg, Ca, Sr, Ba.** Moqine, A. Universite Mohammed 5, Rabat (Morocco). Faculte des Sciences. 1 Dec 1990 164p. (In French). Order Number DE92614763. Source: OSTI; NTIS (US Sales Only); INIS.

A systematic study of mixed mono- and diphosphates of AO-CuO-(P_2O_5) systems (A= Mg, Ca, Sr, Ba) has been carried out. This study showed up, on one hand, continuous and wide ranges in magnesium system and on the other hand, eight new phases in the other systems: Sr sub 18 Cu sub 3 $(PO_4)_{14}$, A_2 Cu $(PO_4)_2$, (A= Sr, Ba), Sr_3 Cu_3 $(PO_4)_4$, $BaCu_2$ $(PO_4)_2$ and $ACu(P_2O_7)$ (A= Ca, Sr, Ba). The crystalline structures of $SrCu(P_2O_7)$, $BaCu(P_2\ O_7)$,Sr_3 Cu_3 $(PO_4)_4$ and $BaCu_2$ $(PO_4)_2$ phosphates have been described and discussed. The first compound presents a Tunnel structure and the three others have Foliation structures. The magnetic behaviours of some Cu sup 2+ ions phos-phates have been correlated to their crystalline structures. The experimental data have been parametered using the Ising model and/or the Heisenberg model. In this work, three Ising theoretical models have been developed. This magnetic study showed up new chains of antiferro- or ferrimagnetic Cu sup 2+ ions. 59 figs., 32 tabs., 113 refs. (author).

7084 (IS-T–1540) **The interaction of formic acid with Pt(111) and the effect of coadsorbed water, atomic oxygen, and carbon monoxide.** Columbia, M.R. Ames Lab., IA (United States). 20 Dec 1991. 247p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE92005094. Source: OSTI; NTIS; INIS; GPO Dep.

We have investigated the reaction of HCOOH with the (111) surface of platinum and its dependence on surface temperature, surface concentration (coverage), and the presence of other adspecies such as H_2O, CO, and atomic oxygen. The motivation for this investigation originates in the electrochemical community, where an interest in the development of fuel cells has existed for years. Small oxygen-containing hydrocarbons like HCOOH show potential as fuels in cells utilizing platinum as the electrode material. The desired reaction in such a cell is the decomposition of the formic acid to produce CO_2, which desorbs from the electrode surface; however, a competing reaction produces adspecies which do not desorb. The accumulation of these adspecies prevents continued adsorption and reaction of formic acid and eventually renders the cell useless. We have probed the reaction of formic acid with Pt(111) in ultrahigh vacuum via thermal desorption spectroscopy and high resolution electron energy loss spectroscopy.

7085 (IS-T–1600) **Reactions of an excited state and of carbon- and sulfur-centere radicals with transition metal complexes.** Huston, P.L. Ames Lab., IA (United States). 3 Dec 1991. 148p. Sponsored by U.S. DOE Energy Research. DOE Contract

W-7405-ENG-82. Order Number DE92005154. Source: OSTI; NTIS; GPO Dep.

The kinetics of the reductive quenching of the ^2E excited state of CrL_3^{3+} (L=2,2′-bipyridine, 1,10-phenanthroline and their substituted analogues) by Ti(3) were investigated at 25°C in 1.0 M LiCl-HCl. The dependence of the rate on hydrogen ion concentration indicates that both $Ti(H_2O)_6^{3+}$ and $(H_2O)_5Ti(OH)^{2+}$ quench. Alkyl radicals, generated from the photohomolysis of organocobalt complexes, were allowed to react in aqueous solution with $(H_2O)_2CrL^{2+}$ (L=1,4,8,11-tetraazacyclopentadecane or $[15]aneN_4$). The reaction rates were evaluated by laser flash photolysis, using the known reaction between R* and the methyl viologen radical cation as a kinetic probe. Reactions of thiyl radicals (RS*) have been studied in aqueous solution using laser flash photolysis. One method used in this study involved generating alkyl radicals by photohomolysis of the cobalt-carbon bond in $RCo([14]aneN_4)^{2+}$ complexes with visible light. The carbon-centered radicals abstract a hydrogen atom from a thiol to form thiyl radicals.

7086 (IS-T–1617) **Nonphotochemical hole burning and relaxation dynamics of amorphous solids at low temperature.** Shu, Luchuan. Ames Lab., IA (United States). 20 Dec 1991. 178p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-82. Order Number DE92005092. Source: OSTI; NTIS; GPO Dep.

Nonphotochemcial hole burning (NPHB) is applied to cresyl violet perchlorate (CV) in polyvinyl alcohol (PVOH) films. The results of temperature-dependent NPHB, polarization NPHB, spontaneous hole filing (SPHF) and laser induced hole filling (LIHF) are presented. A new mechanism of NPHB is proposed. The relaxation dynamics of amorphous solids at low temperature is extensively studied and a high degree of positive correlation between hole burning and SPHF has been found. Both NPHB and SPHF can be described with dispersive kinetics theory. A more physically reasonable interpretation of SPHF kinetics is described by a new methodology in which absolute hole filling is considered. The data on absolute hole filling together with the observation of a high degree of positive correlation between the rates of burning and filling indicate that the dominant mechanism for filling is not global spectral diffusion but rather anti-hole reversion.

7087 (KAERI-II/RR–14/90) **The development of radioactive waste treatment technology (III): Development of radioactive liquid waste treatment technology (II).** Kim, Joon Hyung (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Jung, Ki Jung; Lee, Kune Woo; Park, Hun Hwee. Most PWR stations have experienced leakages of boric acid and oil into liquid radwaste systems. Typically, these wastes have been concentrated by an evaporator system. Based on operating plant experiences, boric acid and oil are the majority of the solid loading for disposal and tend to decrease the efficiency significantly. The objective of these studies is to develop pretreatment techniques for the recovery of boric acid and for the removal of oil from such wastes for improving the evaporator performance. To these objectives, lab. scale reverse osmosis (RO) membrane and filtration/coalescence processes are introduced, which can separate boric acid and oil into waste streams. (Author).

7088 (KAERI/RR–972/90) **A study on the separation characteristics of tritiated water vapor adsorption.** Sung, Ki Woong (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Yong Eak; Na, Jung Won; Kim, Kwang Rag; Bae, Jae Heum; Chung, Hoong Suck; Ahn, Do Hee; Cho, Young Hyun; Paek, Seong Woo; Kim, In Won. In order to reduce the air concentration of ^3H in the reactor building of Wolsung Heavy Water Reactor, a computer code for estimation of adsorption behavior was programmed based on an equation derived for analysis of water vapor adsorption, and a batch and a column apparatus for performance test of adsorption were designed, and a composite adsorption model was introduced for increasement of adsorption efficiency. (Author).

7089 (KFK–4919) **Raman spectroscopic investigation of the formation of $Mg(HCO_3)_2$ used for column regeneration in the MARIX process.** Gantner, E.; Steinert, D. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Radiochemie; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Schadstoffbeherrschung in der Umwelt (PSU). Aug 1991. 21p. (In German). Order Number DE92750159. Source: OSTI; NTIS (US Sales Only).

The suitability of a laser Raman spectrometer equipped with optical fibers for remote process control was demonstrated following the reaction of MgO, H_2O and CO_2 under pressure forming $Mg(HCO_3)_2$ which is used as reagent for column regeneration in the MARIX process. The dissolution of MgO at different CO_2 pressures was followed with time measuring the resultant Raman spectra, and in the same manner also the precipitation and redissolution behaviour of nesquehonite (aqueous $MgCO_3$) was studied which is precipitated from solutions containing $Mg(HCO_3)_2$ under normal pressure. In addition, equilibrium concentrations of bicarbonate formed at different CO_2 pressures were determined using the same analytical technique, and the results were compared with computed data. (orig.).

7090 (LBL–31312) **Tritiation methods and tritium NMR spectroscopy.** Jaiswal, D.K. (Defence Research and Development Establishment, Gwalior (India)); Morimoto, H.; Salijoughian, M.; Williams, P.G. Lawrence Berkeley Lab., CA (United States). Sep 1991. 6p. Sponsored by U.S. DOE Energy Research; U.S. Department of Health and Human Services. DOE Contract AC03-76SF00098. Grant P41 RR01237. (CONF-9109287–4: 4. international symposium on the synthesis and applications of isotopes and isotopically labeled compounds, Toronto (Canada), 3 Sep 1991). Order Number DE92004307. Source: OSTI; NTIS; INIS; GPO Dep.

We have used a simple process for the production of highly tritiated water and characterized the product species by ^1H and ^3H NMR spectroscopy. The water is readily manipulated and used in subsequent reactions either as T_2O, CH_3COOT or CF_3COOT. Development of tritiated diimide has progressed to the point where cis-hydrogenated products at 1-20 Ci/mmole S.A. are possible. Tri-n-butyl tin tritide has been produced at >95% tritium content and well characterized by multinuclear NMR techniques. 27 refs., 3 figs.

7091 (LBL–31459) **1. Mono([8]annulene)Uranium(4) half-sandwich complexes, 2. Novel syntheses of symmetrically substituted cyclooctatetetraenes.** Boussie, T.R. Lawrence Livermore National Lab., CA (United States). Oct 1991. 147p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE92003913. Source: OSTI; NTIS; INIS; GPO Dep.

A reproducible, high-yield synthesis of mono([8]annulene)uranium(4)dichloride (1) is reported, along with the X-ray crystal structural of the bis(pyridine) adduct. Metathesis reactions of the half-sandwich complex 1 with a variety of simple alkyl and alkoxy reagents failed to generate any isolable mono-ring complexes. Reactions of 1 with polydentate, delocalized anions did produce stable derivatives, including mono([8]annulene)uranium(4)bis(acetylacetonate) (4). An X-ray crystal structure of 4 is reported.

7092 **Polymerizable 2(2-hydroxynaphthyl) 2H-benzotriazole compounds.** Gomez, P.M.; Neidlinger, H.H. To Dept. of Energy. 1990. Filed date 21 May 1990. USA Patent patent application 7-525,572. 16p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-83CH10093. Order Number DE92004618. Source: OSTI; NTIS; GPO Dep.

It is an object of the invention to provide benzotriazole compounds as a basis for novel polymeric ultraviolet absorbers having higher wavelength cutoffs of up to about 430nm. Particular ultraviolet absorbers are 2(2-Hydroxynaphthyl) 2H-Benzotriazole compounds having polymerizable unsaturated groups attached to the naphthyl double ring. A further object of the invention is to provide 2(2-Hydroxynaphthyl) 2H-Benzotriazole compounds having polymerizable unsaturated groups on the napthyl ring which can be homopolymerized or copolymerized with a comonomer to obtain polymeric ultraviolet absorbers having high wavelength cutoffs of up to about 430nm. 4 figs.

7093 (PSI–109) **The reducibility of sulphuric acid and sulphate in aqueous solution.** Grauer, R. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Jul 1991. 41p. Order Number DE92614765. Source: OSTI; NTIS (US Sales Only); INIS.

In connection with the Swedish project for final storage of spent fuel elements it was necessary to assess whether dissolved sulphate can corrode the copper canister. A simple reaction between copper and sulphate is thermodynamically impossible, but copper can react to give copper sulphide if an additional electron donor such as iron(II) is available. The problem was extended to the more general question of the reducibility of sulphur(VI) in dilute aqueous solution. Chemical reduction of sulphate does not take place in dilute solution at temperatures below 100°C. In experiments on the reduction of sulphates under hydrothermal conditions a reaction only takes place at temperatures above 275-300°C. The oxidising action of sulphuric acid on metals becomes perceptible only at acid concentrations over 45-50%. In experiments on the cathodic reduction of 74% sulphuric acid the formation of hydrogen sulphide and elementary sulphur starts, depending on the current density, at 50-130°C, and polarographic measurements suggest that the reducible species is not the hydrogen sulphate ion but molecular sulphuric acid. The resistance of copper to oxygen-free sulphuric acid up to a concentration of 60% is well-known. Numerous processes in industrial electrochemistry take place in sulphuric acid or sulphate electrolytes. The reversible metal/metal-sulphate electrodes of lead and cadmium are unstable relative to the corresponding metal sulphides. Nevertheless the reversible lead sulphate electrode does not fail from sulphide formation. All these facts confirm that sulphur(VI) in dilute solution is completely inert towards chemical reducing agents and also to cathodic reduction. Thus corrosion of copper by sulphate under final-storage conditions and in the absence of sulphate reducing bacteria can be almost certainly be ruled out. (author) 5 figs., 85 refs.

7094 (SAND–91-2493C) **Radial dependence of silicon KVV and L_{23}VV Auger matrix elements.** Jennison, D.R. (Sandia National Labs., Albuquerque, NM (United States)); Weightman, P. Sandia National Labs., Albuquerque, NM (United States). [1991]. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-911132–10: 38. national symposium of the American Vacuum Society, Seattle, WA (United States), 11-15 Nov 1991). Order Number DE92004216. Source: OSTI; NTIS; GPO Dep.

We present calculations which show the radial dependence of the KVV and L_{23}VV Auger matrix elements of silicon. We find greatly differing dependences, converging within ~1 a.u. of the nucleus in the case of the KVV, but not until ~4 a.u. in the case of the L_{23}VV, well beyond the bond midpoint of ~2.2 a.u. We also find quite different dependences for the various elements within a particular CVV transition. Because the local density of states (LDOS) is dependent on the radius of the sphere of integration, our results suggest that different CVV Auger processes on the same atom in fact probe different LDOS's, as do even different contributions within the same transition. (This effect is separate from the well-known matrix element property which weights angular-momentum components differently.) These results call into question both the single-site LDOS approximation when used in the interpretation of low-energy (< 100 eV) Auger spectra, and the application to high-energy spectra of local densities of states obtained by integration over muffin-tin or Wigner-Seitz spheres which have a large radius compared to the region probed by the Auger process.

7095 (SKB-TR–90-45) **Interim report on the laboratory and theoretical work in modeling the drained and undrained behavior of buffer materials.** Boergesson, L. (Clay Technology AB, Lund (Sweden)). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1990. 129p. Order Number DE92613324. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the continuous work of modeling the geotechnical properties of buffer materials. Some results of laboratory work with drained and undrained tests are described as well as the material models that these test have yielded. The effective stress concept and its relevance is discussed. The technique to apply the models in calculations using the finite element program ABAQUS is described. Some calculations of laboratory verification tests are shown and the results compared. Finally two examples of scenario calculations are shown. The work has led to three material models that can be used in ABAQUS calculations. All parameters for these models are not fully known and a continuation of the work is required. These models are not suitable for all situations and the relevance and need for further developments are presently investigated. (au).

7096 (SKB-TR–91-15) **Uraninite alteration in an oxidizing environment and its relevance to the disposal of spent nuclear fuel.** Finch, R. (Dept. of Geology, Univ. of New Mexico (United States)); Ewing, R. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1990. 138p. Order Number DE92613325. Source: OSTI; NTIS (US Sales Only); INIS.

Uraninite is a natural analogue for spent nuclear fuel because of similarities in structure and chemistry. Effective assessment of the long-term behavior of spent fuel in a geologic repository requires a knowledge of the corrosion products produced in that environment. Several important natural analogue sites are reviewed, illustrating a wide variety of environments from oxidizing to reducing, including, among others: Cigar Lake, Canada, a uraninite-bearing ore body at depth within a strictly reducing environment; the ore body has 'seen' extensive groundwater interaction with virtually no significant oxidation or mobilization of U apperent. Koongara, Australia is a highly altered uraninite-bearing ore body partially exposed to meteoric water; alteration at depth has resulted from interaction with groundwater having a somewhat reduced Eh compared to the surface. Uraninite, Pb-uranyl oxide hydrates and uranyl silicates control U solubility at depth; uranyl phosphates and U adsorption onto clays and FeMn-oxides control U solubility near the surface. Pocos de Caldas, Brazil displays a redox from moving through uraninite-bearing rocks near the surface and shows local remobilization of U. Oklo, Gabon, a uraninite- and coffinite-bearing ore body, locally affected by intense hydrothermal alteration during fission reactions, demonstrates restricted radionuclide and fission product transport within a reducing environment. A current study being conducted by the authors at Shinkolbwe, Zaire, a uraninite-bearing ore body exposed to highly oxidizing conditions at the surface, provides over 50 species of uranyl phases for detailed study, and illustrates a complex uranyl phase paragenesis over several million years, from earliest-formed uranyl oxide hydrates and uranyl silicates to later-formed uranyl phosphate. (au) (268 refs.).

7097 (DOE/ER/13855–4) **Capacitance of edge plane of pyrolytic graphite in acetonitrile solutions.** Minick, S.K.; Ishida, Takanobu. State Univ. of New York, Stony Brook, NY (United States). Dept. of Chemistry. May 1991. 176p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER13855. Order Number DE92005303. Source: OSTI; NTIS; GPO Dep.

Thesis submitted by S.K. Minick.

The capacitance of the edge plane of pyrolytic graphite electrodes, in acetonitrile solutions, is measured by recording the current response to an applied triangular voltage sweep; TVS, and then fitting the current response with an appropriate function, (via a set of adjustable parameters). The pretreatment of the electrodes, the supporting electrolyte concentration used, and the frequency of the input TVS, were all found to affect the measured capacitance. In these experiments, a background current was also seen and the shape of the current output for the TVS; the charging/discharging curve, is shown to correlate with the magnitude of this background current. In addition, the size of the background current was found to have some dependence on the type of electrode pretreatment procedure used. 60 refs., 49 figs., 3 tabs.

7098 (KCP–613-4506) **Development of high performance liquid chromatographic methods for copper cyanide plating bath additives: Final report.** Foster, R.L. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Dec 1991.

60p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. Order Number DE92004879. Source: OSTI; NTIS; GPO Dep.

The analysis of two plating bath additives used in a copper cyanide plating process are described. Methods were developed that produced HPLC separation of the components and identification of the separated components obtained through mass spectral and nuclear magnetic resonance analyses. The methods can be used for acceptance testing of the additives, and quantitation of components can be performed if suitable standards are obtained. Napthalene sulfonic acid detergents, diphenylsulfones, and five different unidentified compounds behaving like salts were found in additive A. Additive B was found to contain the compound 2-pentene-3-ol, and two or three more components may be present. Acidification with phosphoric acid to a pH of about 2.5 produced a distinctly different chromatogram, indicating the components are affected by pH.

We report photocurrent transients arising from the pulsed laser excitation of the dipolar first excited singlet sate S_1 of trans 4-dimethyl-amino-4′-nitrostilbene (DMANS) in toluene solution. The currents arise from rotational reorientation of DMANS dipoles with respect to the axis of an applied electric field. The method appears to offer a simple and general approach to the measurement of the change in dipole moment upon electronic excitation of a molecule. In another experiment, durene (1,2,4,5-tetramethylbenzene) dissolved in n-hexane was photoionized by 35 psec pulses at 266 nm. Transient absorption at 1064 nm arising chiefly from geminate electrons was detected and used to monitor the recombination of the electron-cation pairs produced by two-photon ionization. An excellent fit to the recombination kinetics was obtained by assuming that the distribution of initial electron-cation separations was of the form $r^2EXP = r^2/(2L^3)exp(-r/L)$ with a mean radius 3L = 5.7 nm.

High resolution synchrotron radiation and Zero-Kinetic-Energy Photoelectron spectroscopy were used to study two-electron transitions in atomic systems at their ionization thresholds. Using this same technique the core-ionized mainline and satellite states of N_2 and CO were studied with vibrational resolution. Vibrationally resolved synchrotron radiation was used to study the dissociation of N_2, C_2H_4, and CH_3Cl near the N 1s and C 1s thresholds. The photoelectron satellites of the argon 3s, krypton 4s and xenon 4d subshells were studied with zero kinetic energy photoelectron spectroscopy at their ionization thresholds. In all of these cases, satellites with lower binding energies are enhanced at their thresholds while those closer to the double ionization threshold are suppressed relative to their intensities at high incident light energies.

7102 (DOE/ER/60455–5) **Mechanisms for radiation damage in DNA: Progress report, June 1, 1991–May 31, 1992.** Sevilla, M.D. Oakland Univ., Rochester, MI (United States). Dec 1991. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER60455. Order Number DE91019079. Source: OSTI; NTIS; INIS; GPO Dep.

In this project we have proposed several mechanisms for radiation damage and recently radiation protection to DNA and its constituents, and have detailed a series of experiments utilizing electron spin resonance spectroscopy, HPLC and GC-mass spectroscopy to test the proposed mechanisms. In this years' work we have continued the investigation of the localization of the initial charges on DNA after irradiation through experiment and through the use of ab initio molecular orbital theory. The experimental results and MO calculations are in agreement that cytosine, not thymine, is likely the principal locus for excess charge; whereas guanine is confirmed as the initial site for the cationic charge. The mechanism for the anion localization on cytosine is clarified by MO calculations of DNA base pair and stacked base pair (GC/AT) ion radicals. In addition predictions made from a new model of ion transfer in DNA are tested and confirmed by an ESR investigation of irradiated single stranded DNA. In this years' effort in joint work with Wake Forest University we have also made excellent progress in the study of products produced from the direct effect of radiation on DNA. The release of unaltered bases and DNA base damage products are shown to be a function of hydration layer and evidence for a demarcation between the direct and indirect effect of radiation is presented. DNA base products from irradiations at ambient temperatures are shown to be those that would be predicted from ESR studies at low temperatures. In addition initial studies of radiation effects on DNA-protein complexes and certain sensitive amino acids have been initiated to shed light on the role of histones on DNA radiation damage. 16 refs., 2 figs., 1 tab.

Recent work in our laboratory has been instrumental in the reformulation of the current model for radiation damage in DNA. We have found that radical ion distribution is a function of strandedness of the DNA. A new model for ion transport through DNA is proposed. We completed an extensive ab initio molecular orbital study of the ion radicals species envolved in DNA radiation damage. In this effort the ionization energies (IE), electron affinities (EA), relative energies, fully optimized structural parameters and spin densities were determined. Joint work with Steven Swarts and Ken Wheeler of Wake Forest on yields of products on irradiation of DNA has also yielded new insights to radiation damage to DNA - specifically the division between the direct and indirect effect. Perhaps our most important work during this period has been in the area of the interaction of thiyl radicals and oxygen as well as (DNA) peroxyl radicals with thiols. The sulfinyl radical, RSO·, was not previously known to be a product of thiol-or carbon-based peroxyl reaction with RSH. The structure of the thiyl peroxyl radical, RSOO, was uncertain. The conversion of RSOO to the sulfonyl radical, RSO_2, and the subsequent reaction with oxygen to form the sulfonyl peroxyl radical, RSO_2OO, had never been suggested in the literature. We have investigated the reactions of thiols with primary ion radicals in γ-irradiated DNA and observed electron transfer from the thiol to the guanine cation radical. This is believed to be the major protective effect of thiols from the direct effect of radiation. Our work with peroxyl radicals has also established that the ESR measured O-17 hyperfine couplings give a good estimate of the relative reactivity of the peroxyl group and shows that the thiol peroxyl radical cannot be a effective hydrogen abstracting agent. 52 refs., 1 tab.

The purpose of this effort is to demonstrate a viable process for breaking down hazardous halogenated organic wastes to simpler, non-hazardous wastes using high energy ionizing radiation. The INEL effort focuses on the use of spent reactor fuel gamma radiation sources to decompose complex wastes such as PCBs. The INEL irradiation experiments concentrated on a single PCB congener so that a limited set of decomposition reactions could be studied. The congener 1, 2′, 3, 3′, 4, 5′, 6, 6′ - octachlorobiphenyl was examined followed exposure to various gamma doses at the ATR spent fuel pool. The decomposition rates and products in several solvents are discussed. 7 refs., 5 figs., 3 tabs.

Most recent advances in time-resolved studies of solvation of excess electron and its geminate recombination in polar liquid in the picosecond to subpicosecond time domain has been reviewed. Emphasis is given on the applicability of two-state model of solvation of this species. Potentiality of Feynman path integral technique and SCF-X$^{\alpha}$-SW technique to describe absorption spectrum of this species has been indicated. (author).

7129 (KAERI/RR–965/90) **Studies on heat shrinkage PVC tubes.** Pyun, Hyung Chick (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Ki Yup; Nho, Young Chang. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 56p. (In Korean). Order Number DE92614805. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation crosslinking of PVC was investigated for the purpose of obtaining a suitable formulation for heat shrinkable tube. PVC was not only compounded with various crosslinking agents and plasticizers to evaluate their effects on the radiation sensitivity, heat shrinkable property and other mechanical properties, but also mixed with NBR, crosslinking agents and plasticizers to obtain efficient crosslinking yield and suitable mechanical properties for heat shrinkable tube. Gel yield of PVC increased with increasing unsaturation levels per molecular weight of crosslinking agents. Among crosslinking agents tested, TMPTMA with three unsaturated groups showed highest gel yield, while PVC containing NBR was more sensitive to crosslinking than PVC itself regardless the types of crosslinking agents and plasticizers. Tensile strength was increased with increasing radiation dose and gel percent, but elongation decreased. It was found that gel percent was increased with increasing radiation dose, heat transformation was decreased with increasing gel percent. When NBR was mixed with PVC, the radiation dosage required for enhancing yield of gel percent and heat transformation were found to be much smaller comparing with the case containing no NBR. Therefore, the addition of NBR to PVC was very effective to increase heat-resisting property of PVC. Heat shrinkage was not much varied with radiation dose, the types of crosslinking agents and plasticizers, but it was increased remarkably with decreasing stretching temperature and increasing annealing temperature. (Author).

7130 (KFK–4850, pp. 140-144) **Investigations into the occurrence of penetrating iodine species. Pt. 2.** Leskopf, W. (Kernforschungszentrum Karlsruhe GmbH (Germany). Lab. fuer Aerosolphysik und Filtertechnik 2); Holl, S. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Investigations on the formation of penetrating iodine species have been continued. Alcohol (methanol, ethanol) and alkene (ethylene, propylene) vapour-air mixtures were radiolyzed with iodine in a Co-60 gamma source. The concentration and the irradiation doses were varied (4,45 E + 04-6,2 E + 06 rad). The gaseous products were analyzed qualitatively and quantitatively by an ECD and a MSD detector for iodine compounds difficult to separate. (orig.).

7131 (CNIC–00410) **A new technique for ion beam tritium labelling.** Zhang Nianbao (Academia Sinica, Shanghai, SH (China). Shanghai Inst. of Nuclear Research); Sheng Shugang; Yao Fuzeng. China Nuclear Information Centre, Beijing, BJ (China). Jun 1990. 9p. (In Chinese). (SINR–0001.). Order Number DE92613351. Source: OSTI; NTIS (US Sales Only); INIS.

An advanced technique, the ion beam tritium labelling method (IBTL), used for labelling proteins, peptides and other nonvolatile organic compounds is introduced. In this method the excited tritium ion beam is accelerated and then bombs a solid sample target in which tritium exchanging for hydrogen is taken place. The IBTL has been used for preparation of tritiated soybean trypsin inhibitor, ribonuclease A, elastin and pachyman etc. After purifing by dialysis, ion exchange chromatography and gel filtration, the tritiated proteins and polysaccharide were obtained with the specific activity over 37 GBq/mmol, the function of tritiated decomposition products was not found. The product was shown to have native biological activity. Amino acid analysis of tritiated protein showed that the relative specific radioactivities were higher for His., Tyr. and Phe. but lower for Val., Ile. and Ser.

7132 (CNIC–00432) **Successive change regularity of actinide properties with atomic number: On the 30th anniversary of the completion of actinides.** Yang Xuexian (Chinese Academy of Agricultural Sciences, Beijing, BJ (China). Inst. for Application of Atomic Energy). China Nuclear Information Centre, Beijing, BJ (China). Aug 1990. 17p. (In Chinese). (CSNAS–0034.). Order Number DE92613346. Source: OSTI; NTIS (US Sales Only); INIS.

The development and achievements on chemistry of actinide elements are summarised. The relations of properties of actinides to their electronic configurations of valence electronic shells are discussed. Some anomalies of solid properties, the radius contraction, the stable state effect of f^{7n}-orbits (n = 0, 1, 2) and the tetrad effect of oxidation states, etc., with atomic number (Z) are described. 31 figures appended show directly the successive change regularity of actinide properties with Z.

7133 (DOE/ER/40402–4) **[Studies of target fragmentation in intermediate energy, relativistic and ultra-relativistic nuclear collisions]: Nuclear chemistry progress report, August 1, 1990–August 1, 1991.** Loveland, W.D. The work described herein is part of a project involving the study of low energy (< 10 MeV/A), intermediate energy (10–100 MeV/A) and relativistic (> 250 MeV/A) heavy ion reactions. In the low energy regime, we published a monograph on the properties of the heaviest elements and used that publication as a basis for making a set of "best" semi-empirical predictions of heavy element decay properties. The intermediate energy research effort focussed upon the completion of studies already begun and the initiation of a number of new experiments. In our study of a interaction of 21 MeV/nucleon ^{129}Xe with ^{197}Au, we compared the characteristics of the observed deep inelastic phenomena with various models of dissipative reactions and found significant discrepancies between observations and predictions. These discrepancies seemed to be caused by an improper treatment of pre-equilibrium in the early stages of the collision. In our study of the relativistic interaction of 400 MeV/nucleon ^{12}C with ^{197}Au, we reported the first direct physical measurement of the properties of the spallation residues from a nucleus-nucleus collision. We found the residue energies to be much lower than those predicted by the intranuclear cascade model, indicating some substantial modifications of that model are needed. But, we also found, indications of significant, non-zero values of the residue transverse momentum, a finding that calls into question the interpretation of a number of radiochemical recoil studies of the kinematics of high energy reactions. A program of performing numerical simulations of intermediate and high energy nuclear collisions using the QMD model was initiated.

Simultaneous use of a number of radioactive tracers is useful for the precise determination of characteristic behaviour of different element under identical experimental conditions. 20 and 100 μM thick gold foils were irradiated with 95 MeV/nucleon ^{40}Ar beam in Ring cyclotron employing falling ball irradiation system. A number of radionuclides are formed primarily by spallation reaction of energetic heavy ion beam. A radiochemical method has been developed for the separation of radionuclides. (author). 2 refs., 1 fig.

Cation effect on initial retention and recovery after heating in ten different lanthanide bromates is investigated. Difference in weight loss after decomposition seems to be more significant. (author). 3 refs., 1 tab.

7140 (IPEN-PUB–338) **Production of lyophilized macroaggregated albumin (MAA) kits to be labelled with sup(99m)Tc for lung scanning.** Hamada, E.S.; Muramoto, E.; Brito, R.H.; Sosa de Pereira, N.P.; Almeida, M.A.T. de. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). Jun 1991. 14p. (In Portuguese). Order Number DE92613352. Source: OSTI; NTIS (US Sales Only); INIS.

Among the various macroaggregation procedures described in the literature, we have developed a rapid and reliable method for the routine production of lyophilized Sn-Macroaggregated Albumin (Sn-MAA) kits to be labelled with ^{99m}Tc for lung perfusion scanning. The reaction vial contains a lyophilized suspension having the following components: 1,0mg of Aggregated Human Serum Albumin (MAA), 0,12mg of hydrated stannous chloride ($SnCl_2.2H_2O$), 5,0mg of Normal Human Serum Albumin (HSA) and 1% of Tween 80 as emulsifying agent. In this method the Sn-MAA kits were performed in a single step process, and a consistent suitable range of particle size (10-80 mu) was obtained. The size of the particles and the effect of storage time on the stability for the lyophilized kits were also investigated. The radiochemical purity, higher than 98% in ^{99m}Tc Macroaggregated was determined by using ascending paper chromatography (Whatman n.3 and 85% methanol): biodistribution studies in rats have shown the high uptake in the lungs 85%/D with low liver uptake 2%/d and lung-liver ratios 98 ± 1%. Excellent human lung images for clinical practice were obtained with these kits, which are prepared at IPEN-CNEN/SP for brazilian physicians. (author).

7141 (KAERI-II/RR–12/90) **Basic chemistry for radioactive waste management: Studies on the chemical behaviors of radioactive elements.** Park, Kyong Kyun (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Won Ho; Jee, Kwang Yong; Kim, Jong Goo; Park, Yeong Jae; Yu, Mahn Su; Jee, Choun Suk; Song, Byoung Chul; Choi, Ke Chon; Eom, Tae Yoon. The complex formation between uranium(VI) ion and chloride ion in aqueous solution can be confirmed by UV-Vis absorption spectroscopy and differential pulse polarography. Absorption spectra and differential pulse polarograms of uranyl ion in hypochlorite/chloride media shows for its interaction with hypochlorite ion. Although the spectral changes for its interaction are ambiguous, new half-wave potential due to the interaction of uranium(VI)-hypochlorite ion appears in the differential pulse polarogram. Kinetic studies on the electron transfer reaction between U(IV) ion and Fe(III)(phen)3 complex in the solution containing dipicolinic acid or phosphoric acid show that the reaction rate slows down in low ligands concentration and speeds up in high ligands concentration. This result indicates that free functional group of multidentate ligands coordinated to U(IV) ion interacts at the 2 or 9 position carbon atom of phenanthroline ring in iron(III) complex. The presence of 5-sulfosalicylic acid slows down the electron transfer reaction between U(IV) ion and Fe(III) ion through the complex formation with two reactants. More information about the complex formation between U(IV) ion and 5-sulfosalicylic acid is needed for accurate explanation of the reaction mechanism. Both plutonium and uranium are extracted by TBP/dodecane from the aqueous solution, in which the post-irradiated nuclear fuel pellet is dissolved. They are back-extracted into 2M HCl solution after reducing plutonium(IV) ion to plutonium(III) ion by added U(IV) ion. Removing uranium on the DOWEX A-I anion exchange column, plutonium is eluted later for its purification. Gamma and alpha spectroscopic measurements shows the high decontamination factor and 95% recovery for the initial amounts of plutonium. (Author).

7142 (LBL–31347) **Design and operations at the National Tritium Labelling Facility.** Morimoto, H.; Williams, P.G. Lawrence Berkeley Lab., CA (United States). Sep 1991. 6p. Sponsored by National Institute for Occupational Safety and Health. DOE Contract AC03-76SF00098. Grant P41RR01237. (CONF-910920–9: 4. topical meeting on tritium technology in fission, fusion, and isotopic applications, Albuquerque, NM (United States), 30 Sep - 4 oct 1991). Order Number DE92004098. Source: OSTI; NTIS; INIS; GPO Dep.

The National Tritium Labelling Facility (NTLF) is a multipurpose facility engaged in tritium labeling research. It offers to the biomedical research community a fully equipped laboratory for the synthesis and analysis of tritium labeled compounds. The design of the tritiation system, its operations and some labeling techniques are presented.

7144 (UCRL–53868-90, pp. 2.12-2.14) **NIKE3D development.** Maker, B.N. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

During FY 90, the authors enhanced the capabilities of their three-dimensional, implicit, nonlinear finite element code NIKE3D by adding several important features. To improve accuracy in nonlinear solutions to continuum and structural mechanics problems, they implemented the incompatible modes and YASE element formulations. To solve larger problems using less computer time, they added an element-by-element conjugate gradient solver. In order to model a larger class of material behavior they added new creep, anisotropic, and composite constitutive models. They also enhanced thermal and eigenvalue analysis capabilities, and included an interface to DYNA3D for static initialization of high-rate dynamic analyses. These enhancements have been documented in a comprehensive user's manual.

7145 (UCRL–53868-90, pp. 2.23-2.27) **A new coupled thermomechanical analysis code.** Engelmann, B.E.; Whirley, R.G. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors have developed a new coupled thermomechanical analysis code called PALM2D. This new code solves for the coupled thermomechanical response of axisymmetric or plane strain solids, including nonlinear effects. The thermal problem may include temperature-dependent thermal conductivities and convection boundary conditions, and the mechanical problem may include large deformations and strains as well as material nonlinearities such as plasticity Coupling is achieved through a staggered-step formulation. Heat generation due to plastic work is included, and all heat-transfer computations are done on the deformed geometry. PALM2D is a rapidly evolving code, and they expect many enhancements in the near future.

7146 (UCRL–53868-90, pp. 3.17-3.20) **Scaling basic kinematic machines to micron dimensions.** Ciarlo, D.R.; Folta, J.A.; Orvis, W.J. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors have begun working in microdynamics, a new field of engineering in which integrated circuit technology is used to fabricate miniature mechanical devices with movable parts. They designed and fabricated a microstructure to test their abilities in microfabrication techniques. Their test bed structure is an array of miniature cantilever beams that can be electrostatically deflected and used in laser scanning systems. They have established that the microbeams are deflected by electrostatic forces, and have successfully tested them with waveforms up to 1 kHz.

7147 (ANL/CP–73489) **Seismic isolation systems designed with distinct multiple frequencies.** Wu, Ting-shu; Seidensticker, R.W. Argonne National Lab., IL (United States). [1991]. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. (CONF-911213–18: American Society of Mechanical Engineers (ASME) annual winter meeting, Atlanta, GA (United States), 1-6 Dec 1991). Order Number DE92004151. Source: OSTI; NTIS; INIS; GPO Dep.

Two systems for seismic base isolation are presented. The main feature of these system is that, instead of only one isolation frequency as in conventional isolation systems, they are designed to have two distinct isolation frequencies. When the responses during an earthquake exceed the design value(s), the system will automatically and passively shift to the secondly isolation frequency. Responses of these two systems to different ground motions including a harmonic motion with frequency same as the primary isolation frequency, show that no excessive amplification will occur. Adoption of these new systems certainly will greatly enhance the safety and reliability of an isolated superstructure against future strong earthquakes. 3 refs.

7148 (CONF-9109217–2) **SAS1 and SAS4, two new shielding analysis sequences for spent fuel casks.** Broadhead, B.L.;

Tang, J.S.; Parks, C.V. Oak Ridge National Lab., TN (United States). [1991]. 13p. Sponsored by U.S. DOE Radioactive Waste Management; Nuclear Regulatory Commission. DOE Contract AC05-84OR21400. From Seminar on SCALE-4 and related modular systems for the evaluation of nuclear fuel facilities and package design featuring criticality, shielding and heat transfer capabilities; Gif-sur-Yvette (France); 17-20 Sep 1991. Order Number DE92005122. Source: OSTI; NTIS; INIS; GPO Dep.

Two important Shielding Analysis Sequences (SAS) have recently been developed within the SCALE computational system. These sequences significantly enhance the existing SCALE system capabilities for evaluating radiation doses exterior to spent fuel casks. These new control module sequences (SAS1 and SAS4) and their capabilities are discussed and demonstrated. Particular attention is given to the new SAS4 sequence which provides an automated scheme for generating and using biasing parameters in a subsequent Monte Carlo analysis of a cask.

7151 (ES/CSET–11) **Natural phenomena application guide, Phase 2: Safety Analysis Report Update Program.** Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). Nov 1991. 24p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC05-84OR21400. Order Number DE92003962. Source: OSTI; NTIS; GPO Dep.

The evaluation of the effects of natural phenomena loading on the safety of facility operation is an identified requirement of facility safety analysis. Department of Energy guidance pertinent to the evaluation of the response of facilities to natural phenomena are summarized in this application guide. This document is written to provide guidance to the participants in performing the evaluations. The response of facilities to natural phenomena loading will be evaluated for portions of those facilities that are tentatively identified as moderate or high hazard and for associated low hazard portions along with possible interactions with adjacent facilities. The natural phenomena evaluation requires the integrated efforts of the facility operators, safety analyst, and structural analyst. This document describes interfaces important to this integration. It also provides specific guidance to the structural analyst. This guidance is in the form of magnitude of loading, evaluation methodology, applicable codes and standards and content of the report to be produced.

7153 (KCP–613-4529) **Clean room wiping liquids.** Harding, W.B. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Dec 1991. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. Order Number DE92004793. Source: OSTI; NTIS; GPO Dep.

A water-based liquid containing isopropyl alcohol, ammonium hydroxide, and surfactants was developed to replace 1,1,2-trichlorotrifluoroethane for the dampening of clean room wiping cloths used to wipe clean benches, clean room equipment, and latex finger cots and gloves.

7154 (KCP–613-4621) **Computer-aided process planning: Development of an expert process planning system: Final report.** Brooks, S.L.; Hummel, K.E.; Wolf, M.L. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Dec 1991. 42p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. Order Number DE92004880. Source: OSTI; NTIS; GPO Dep.

The project utilizes artificial intelligence (AI) technology to develop an expert system that will be used to prepare production plans, to automatically make cutting tool selections, and to automatically define machinability parameters and NC tape requirements. The expert system, XCUT, can plan features on moderately complex prismatic machined parts and reduce 2 to 4 hours of manual process effort into 15 or 30 minutes. Areas of future work have been identified that will enable the XCUT system to be used for production. These areas where further development is required are geometric reasoning, representation of manufacturing features, dimensioning and tolerancing, feature extraction, distributed computing architecture, knowledge gathering, and user interfaces.

7155 (KCP–613-4643) **Combining noise factors and process parameters in a response surface.** Wyckoff, J. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Nov 1991. 23p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00613. (CONF-9108100–7: American Statistical Association (ASA) annual meeting, Atlanta, GA (United States), 18-22 Aug 1991). Order Number DE92003739. Source: OSTI; NTIS; GPO Dep.

This paper covers the strategy and analysis of an experiment to characterize a gas tungsten arc welding process. The experiment combined four non-controlled product features, or noise factors, and four controlled process parameters. A non-traditional response surface design was employed. Multiple responses were modeled. Optimal settings for the process parameters to successfully weld the widest range of the pertinent product features were identified. Thus, the process was made "robust" against "noise" factors. Comparisons are made between the experimental and analytical approach taken versus the Taguchi style of experimentation and analysis. This comparison is mainly done with respect to the information gained, such as product design criteria, incoming material specifications, and process adjustments for non-conforming material. 11 figs., 3 tabs.

7156 (KFK–4850, pp. 117-126) **Venting filter for LWR.** Dillmann, H.G. (Kernforschungszentrum Karlsruhe GmbH (Germany). Lab. fuer Aerosolphysik und Filtertechnik 2); Pasler, H.; Schmitt, H.; Bleier, K. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

1990 two tests have been done successfully in France at the Fuchia-loop with CsOH loading of metal fiber filters. A filter modul is tested with a back flow to see the effect in the efficiency after such an event. The thermal capability has been testet for the time after the venting process with no cooling gas stream. Downstream of the multistage fiber filter unit a second filter unit is used with a binary doped zeolith as the sorbens for elementary iodine removal. Also methyl iodine is retained. The removal efficiency and the catalytic behaviour with regard to the H_2/O_2-reaction are indicated. The test methods are described. (orig.).

7157 (KFK–4850, pp. 127-130) **HEPA filter response to accident conditions.** Neuberger, M. (Kernforschungszentrum Karlsruhe GmbH (Germany). Lab. fuer Aerosolphysik und Filtertechnik

2); Fronhoefer, M.; Hardy, T.; Kuhn, W.; Ricketts, C.I. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

To guarantee the integrity of new, high-strength HEPA filters over a long time a number of experiments in the ventilation systems of KfK and on a vibration table - to simulate the transport of the filters - were conducted. Following tests show no penetration. Oscillating motions of samples of filter media with and without tears show no damages to the papers. A loss of integrity of the filters by stress over a long time so can be excluded. The theoretical modelling of the Δp increases of filters exposed to fog conditions was continued. A good agreement between theoretical and experimental values was obtained. (orig.).

7158 (KFK–4850, pp. 131-139) **Challenges within ventilation systems during accident situations.** Neuberger, M. (Kernforschungszentrum Karlsruhe GmbH (Germany). Lab. fuer Aerosolphysik und Filtertechnik 2); Bletzer, P.; Fronhoefer, M.; Hardy, T.; Kuhn, W.; Ricketts, C.I.; Schmidmeier, K.H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

To help estimate the mechanical loading at the service location two fluid dynamic codes were investigated. FLOWMASTER shows good results in generating the air-cleaning network and in calculating steady state conditions, but fails in calculating fluid dynamic transients. PROMO is very time consuming in generating the network, but one can obtain good results in calculating fluid dynamic transients. In addition to the challenges posed by elevated pressure, temperature, and air flow, the effects of shock waves, caused by explosions or hydrogen detonations must be considered. The problem of a 'shock-shock' in the flow after the diverging channel by high shock strengths were solved. In order to guarantee the safety margins of filter units during their entire service lives, filter performance needs to be verified under standardized test conditions that take into consideration the particularly adverse effects of filter exposure to super-saturated airflows and elevated differential pressure. The detail construction for a rig to type test filter units under fog conditions and increased pressure drop was finished, and the components of the test facility were chosen. (orig./DG).

7159 **Fiber optic mounted laser driven flyer plates.** Paisley, D.L. To Dept. of Energy. 1990. Filed date 2 Apr 1990. USA Patent patent application 7-502,960. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92003835. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a laser driven flyer plate where the flyer plate is deposited directly onto the squared end of an optical fiber. The plasma generated by a laser pulse drives the flyer plate toward a target. In another embodiment, a first metal layer is deposited onto the squared end of an optical fiber, followed by a layer of a dielectric material and a second metal layer. The laser pulse generates a plasma in the first metal layer, but the plasma is kept away from the second metal layer by the dielectric layer until the pressure reaches the point where shearing occurs. 2 figs.

7160 **System and method for exchanging tools and end effectors on a robot.** Burry, D.B.; Williams, P.M. To Dept. of Energy. 1990. Filed date 2 Apr 1990. USA Patent patent application 7-502,962. 29p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC34-90DP62349. Order Number DE92003836. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a system and method for exchanging tools and effectors on a robot permits exchange during a programmed task. The exchange mechanism is located off the robot, thus reducing the mass of the robot arm and permitting smaller robots to perform designated tasks. A simple spring/collet mechanism mounted on the robot is used which permits the engagement and disengagement of the tool or end effector without the need for a rotational orientation of the tool to the end effector/collet interface. As the tool changing system is not located on the robot arm no umbilical cords are located on robot.

7161 **Conduit grinding apparatus.** Nachbar, H.D.; Korytkowski, A.S. To Dept. of Energy. 1990. Filed date 3 Apr 1990. USA Patent patent application 7-504,152. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC12-76SN00052. Order Number DE92003837. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a grinding apparatus for grinding the interior portion of a valve stem receiving area of a valve. The apparatus comprises a faceplate, a plurality of cams mounted to an interior face of the faceplate, a locking bolt to lock the faceplate at a predetermined position on the valve, a movable grinder and a guide tube for positioning an optical viewer proximate the area to be grinded. The apparatus can either be rotated about the valve for grinding an area of the inner diameter of a valve stem receiving area or locked at a predetermined position to grind a specific point in the receiving area.

7162 **Precision wire feeder for small diameter wire.** Brandon, E.D.; Hooper, F.M.; Reichenbach, M.L. To Dept. of Energy. 1990. Filed date 9 Apr 1990. USA Patent patent application 7-506,126. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92003842. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a device for feeding small diameter wire having a diameter less than .04 mm (16 mil) to a welding station which includes a driving wheel for controllably applying a non-deforming driving force to the wire to move the free end of the wire towards the welding station; and a tension device such as a torque motor for constantly applying a reverse force to the wire in opposition to the driving force to keep the wire taut. 1 fig.

7163 **Hot cell examination table.** Gaal, P.S.; Ebjer, L.P.; Kareis, J.H.; Schlegel, G.L. To Dept. of Energy. 1990. Filed date 27 Apr 1990. USA Patent patent application 7-515,307. 15p. Sponsored by National Aeronautics and Space Administration. Contract N00024-79C-4026. Order Number DE92004605. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a table for use in a hot cell or similar controlled environment for use in examining specimens. The table has a movable table top that can be moved relative to a table frame. A shaft is fixedly mounted to the frame for axial rotation. A shaft traveler having a plurality of tilted rollers biased against the shaft is connected to the table top such that rotation of the shaft causes the shaft traveler to roll along the shaft. An electromagnetic drive is connected to the shaft and the frame for controllably rotating the shaft.

7164 **Automatic feed system for ultrasonic machining.** Calkins, N.C. To Dept. of Energy. 1990. Filed date 11 May 1990. USA Patent patent application 7-522,016. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92004614. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a method and apparatus for ultrasonic machining in which feeding of a tool assembly holding a machining tool toward a workpiece is accomplished automatically. In ultrasonic machining, a tool located just above a workpiece and vibrating in a vertical direction imparts vertical movement to particles of abrasive material which then remove material from the workpiece. The tool does not contact the workpiece. Apparatus for moving the tool assembly vertically is provided such that it operates with a relatively small amount of friction. Adjustable counterbalance means is provided which allows the tool to be immobilized in its vertical travel. A downward force, termed overbalance force, is applied to the tool assembly. The overbalance force causes the tool to move toward the workpiece is material is removed from the workpiece.

7165 **Valve stem and packing assembly.** Wordin, J.J. To Dept. of Energy. 1990. Filed date 31 May 1990. USA Patent patent application 7-531,487. 19p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-84ID12435. Order Number DE92003777. Source: OSTI; NTIS; GPO Dep.

A valve stem and packing assembly is provided in which a rotatable valve stem includes a first tractrix surface for sliding contact with a stem packing and also includes a second tractrix surface for sliding contact with a bonnet. Force is applied by means of a spring, gland flange, and gland on the stem packing so the stem packing seals to the valve stem and bonnet. This configuration serves to create and maintain a reliable seal between the stem packing and the valve stem. The bonnet includes a second complementary tractrix surface for contacting the second sliding tractrix surface, the combination serving as a journal bearing for the entire valve stem and packing assembly. The journal bearing so configured is known as a Schiele's pivot. The Schiele's pivot also serves to maintain proper alignment of the valve stem with respect to the bonnet. Vertical wear between the surfaces of the Schiele's pivot is uniform at all points of contact between the second sliding tractrix surface and the second complementary tractrix surface of a bonnet. The valve stem is connected to a valve plug by means of a slip joint. The valve is opened and closed by rotating the valve stem. The slip joint compensates for wear on the Schiele's pivot and on the valve plug. A ledge is provided on the valve bonnet for the retaining nut to bear against. The ledge prevents overtightening of the retaining nut and the resulting excessive friction between stem and stem packing.

7166 Method and apparatus for continuous flow injection extraction analysis. Harkenstein, S.D.; Siemer, D.D. To Dept. of Energy. 1990. Filed date 8 Jun 1990. USA Patent patent application 7-534,897. 17p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-84ID12435. Order Number DE92003743. Source: OSTI; NTIS; GPO Dep.

A method and apparatus for a continuous flow injection batch extraction analysis system is disclosed employing extraction of a component of a first liquid into a second liquid which is a solvent for a component of the first liquid, and is immiscible with the first liquid, and for separating the first liquid from the second liquid subsequent to extraction of the component of the first liquid. 1 fig.

7167 Miniaturized pressurization system. Whitehead, J.C.; Swink, D.G. To Dept. of Energy. 1990. Filed date 9 Jul 1990. USA Patent patent application 7-550,280. 22p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003821. Source: OSTI; NTIS; GPO Dep.

This invention relates to pressurization systems and liquid rocket propulsion systems, and particularly to those used to attitude control or maneuvering of small space vehicles or airborne vehicles where the requirement for thrust is intermittent rather than continuous, and must be available rapidly upon demand. This invention also relates to increasing performance of such propulsion systems, by way of eliminating inert mass from the propulsion system. The invention uses a fluid stored at a low pressure and provides the fluid at a high pressure. The invention allows the low pressure fluid to flow to a fluid bore of a differential pump and from the pump to a fluid pressure regulator. After flowing through the regulator the fluid is converted to a gas which is directed to a gas bore of the differential pump. By controlling the flow of gas entering and being exhausted from the gas bore, the invention provides pressure to the fluid. By setting the regulator, the high pressure fluid can be set at predetermined values. Because the invention only needs a low pressure fluid, the inventive apparatus has a low mass, and therefore would be useful in rocket propulsion systems.

7168 A method and apparatus for continuous electrophoresis. Watson, J.S. To Dept. of Energy. 1990. Filed date 10 Jul 1990. USA Patent patent application 7-551,387. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92003822. Source: OSTI; NTIS; GPO Dep.

A method and apparatus for conducting continuous separation of substances by electrophoresis are disclosed. The process involves electrophoretic separation combined with couette flow in a thin volume defined by opposing surfaces. By alternating the polarity of the applied potential and producing reciprocating short rotations of at least on of the surfaces relative to the other, small increments of separation accumulate to cause substantial, useful segregation of electrophoretically separable components in a continuous flow system.

7169 (RFP–4488) **In-place calibration of glovebox differential pressure gauges.** Abercrombie, K.R. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 2 Oct 1991. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC34-90DP62349. Order Number DE92004799. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In November 1989, concern about the health and safety of workers and the environment halted plutonium operations at the Rocky Flats Plant (RFP). As a result, it became necessary to certify the instrumentation used to monitor and control conditions at the plant affecting health, safety, and the environment. Many of these Vital Safety Systems (VSS) had never been calibrated. Glovebox differential pressure gauges are one example of VSS instrumentation that had never been certified. The RFP Standards Laboratory was requested to develop a method to certify these gauges. After examining several options, it was decided to replace existing gauges with new, certified gauges and incorporate a three-way valve and filter to allow recalibration. This system has been in place for one year. Recent recalibration of 78 gauges, in place, demonstrates that this method meets or exceeds all expectations.

7170 (RFP–4509) **Low-cost teleoperator-controlled vehicle for damage assessment and radiation dose measurement.** Tyree, W.H. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1991]. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC34-90DP62349. (CONF-911106–20: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92003637. Source: OSTI; NTIS; INIS; GPO Dep.

A low-cost, disposable, radio-controlled, remote-reading, ionizing radiation and surveillance teleoperator re-entry vehicle has been built. The vehicle carries equipment, measures radiation levels, and evaluates building conditions. The basic vehicle, radio control with amplifiers, telemetry, elevator, and video camera with monitor cost less than $2500. Velcro-mounted alpha, beta-gamma, and neutron sensing equipment is used in the present system. Many types of health physics radiation measuring equipment may be substituted on the vehicle. The system includes a black-and-white video camera to observe the environment surrounding the vehicle. The camera is mounted on a vertical elevator extendible to 11 feet above the floor. The present vehicle uses a video camera with an umbilical cord between the vehicle and the operators. Preferred operation would eliminate the umbilical. Video monitoring equipment is part of the operator control system. Power for the vehicle equipment is carried on board and supplied by sealed lead-acid batteries. Radios are powered by 9-V alkaline batteries. The radio control receiver, servo drivers, high-power amplifier and 49-MHz FM transceivers were irradiated at moderate rates with neutron and gamma doses to 3000 Rem and 300 Rem, respectively, to ensure system operation.

7171 (SAND–91-1064) **Certification testing of the Los Alamos National Laboratory Heat Source/Radioisotopic Thermoelectric Generator shipping container.** Bronowski, D.R.; Madsen, M.M. Sandia National Labs., Albuquerque, NM (United States). Sep 1991. 113p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (TTC–1071). Order Number DE92003340. Source: OSTI; NTIS; INIS; GPO Dep.

The Heat Source/Radioisotopic Thermoelectric Generator shipping counter is a Type B packaging currently under development by Los Alamos National Laboratory. Type B packaging for transporting radioactive material is required to maintain containment and shielding after being exposed to normal and hypothetical accident environments defined in Title 10 of the Code of Federal Regulations Part 71. A combination of testing and analysis is used to verify the adequacy of this packaging design. This report documents the testing portion of the design verification. Six tests were conducted on a prototype package: a water spray test, a 4-foot normal conditions drop test, a 30-foot drop test, a 40-inch puncture test, a 30-minute thermal test, and an 8-hour immersion test.

7172 (SAND–91-2204) **Transportation environments of the AL-SX (H1616).** York, A.R. II. Sandia National Labs., Albuquerque, NM (United States). Nov 1991. 76p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004783. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Tritium gas reservoirs are often transported to a weapon as an individual component packaged in a radioactive materials transportation container. A new transportation container, the AL-SX, has been certified by the Nuclear Explosive Safety Division of the Department of Energy to meet Title 10, Part 71 of the Code of Federal Regulations for transport of radioactive material. The gas reservoir provides containment of tritium gas during normal operating conditions for the AL-SX/2 and the AL-SX/3 (without a tritium getter). It is important to know the environments that the reservoir experiences during shipment to determine if there are any effects on its safety or reliability. This report defines environments and test specifications that may be used to qualify normal transportation environments for reservoirs. Also, a summary of vibration/shock and thermal test results is presented for a few reservoirs that have limiting features (e.g., maximum decay heat, maximum weight, etc.).

7173 (UCID–21756) **Corrosion models for predictions of performance of high-level radioactive-waste containers.** Farmer, J.C. (Lawrence Livermore National Lab., CA (United States)); McCright, R.D.; Gdowski, G.E. Lawrence Livermore National Lab., CA (United States). 1 Nov 1991. 41p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-7405-ENG-48. Order Number DE92004467. Source: OSTI; NTIS; INIS; GPO Dep.

The present plan for disposal of high-level radioactive waste in the US is to seal it in containers before emplacement in a geologic repository. A proposed site at Yucca Mountain, Nevada, is being evaluated for its suitability as a geologic repository. The containers will probably be made of either an austenitic or a copper-based alloy. Models of alloy degradation are being used to predict the long-term performance of the containers under repository conditions. The models are of uniform oxidation and corrosion, localized corrosion, and stress corrosion cracking, and are applicable to worst-case scenarios of container degradation. This paper reviews several of the models.

7174 (UCRL-CR–105696) **LLNL evaluation of the Portacount for determining respirator fit factors.** Biermann, A.H.; da Roza, R.A.; Foote, K.L.; McCormack, C.E.; Sackett, C.R.; Sawyer, S.R. Lawrence Livermore National Lab., CA (United States). Oct 1991. 58p. Sponsored by U.S. Department of Labor. DOE Contract W-7405-ENG-48. Order Number DE92004666. Source: OSTI; NTIS; GPO Dep.

We investigated the use of a portable condensation nucleus counter (the model 8010 Portacount by TSI, Inc.) as a detector for quantitative fit testing of respirators. Fit test results were compared with measurements using an aerosol photometer, which is the instrument of choice for quantitative fit testing of respirators. In the first phase of this study, simultaneous measurements were made with the two instruments using a mannequin head and breathing machine to test the instrumentation without the added variability of human test subjects. The second phase of the study involved characterizing the aerosols in the ambient environment, calculating the effect of fine particles generated by human breathing, and comparing the fit test results obtained by the Portacount and the photometer from human test subjects. The third phase of the study was the production of a supplementary manual of special instructions for using the Portacount, such as the application limit of the instrument, start-up procedure, data collection, and maintenance. In the first phase of our experiment, we fitted a mannequin head with an MSA Ultravue full-face respirator. The fit factors as measured by the Portacount and photometer were compared at several different simulated leak conditions. Two challenge aerosols were selected for these in investigations: an oil mist aerosol and the ambient room aerosol. The oil mist aerosol is similar to that routinely used in fit tests using the photometer as the detector. The room aerosol was of interest because the Portacount can be used with less-concentrated aerosols due to its greater sensitivity. The second phase of our study, which used human subjects, found results that were in agreement with the mannequin/breathing-machine results. The fit testing involved 10 human subjects using the eight exercises from the OSHA asbestos standard.

7175 (UCRL-ID–108596) **Implementation of the J-integral option in NIKE2D.** Zywicz, E. Lawrence Livermore National Lab., CA (United States). 1 Jul 1991. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92004625. Source: OSTI; NTIS; GPO Dep.

Numerical procedures have been incorporated into the finite-deformation finite element (FE) code NIKE2D to extract fracture mechanics parameters directly from the equilibrium solution. The domain integral implementation permits the energy release rate, as measured by the J-Integral to be evaluated under static states from general (non-isothermal) conditions and for restricted thermal conditions. Thermal J extractions are limited to material systems which posses a linearly elastic dilatational response. A mode mixity separation technique, based upon energy interaction integrals, is implemented for planar geometries and permits the mode 1 and 2 components of the static stress intensity factors to be calculated for both homogeneous isotropic elastic and isotropic elastic interfacial cracks. The small-strain mode separation method includes an optional compensator which accounts for large rigid-body crack-tip rotations. User input is minimized because the implementation automatically determines the integration domains from the user specified crack-tip nodes. Several example problems demonstrate the various features and overall accuracies. 31 refs., 4 figs., 6 tabs.

7176 (UCRL-JC–108589) **Applications of intelligent telerobotic control.** Herget, C.J.; Grasz, E.L.; Merrill, R.D. Lawrence Livermore National Lab., CA (United States). Oct 1991. 7p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-48. Order Number DE92004655. Source: OSTI; NTIS; GPO Dep.

The telerobotics laboratory at Lawrence Livermore National Laboratory is a facility for developing and testing new concepts in robotics controls. Research and development is being conducted in computer vision; adaptive control; software architectures for real-time, intelligent control; artificial neural networks; fuzzy logic controllers; telepresence; and path planning and collision avoidance. The equipment in the telerobotics laboratory includes a six degree of freedom articulating robot arm with controller, gripper, and force and torque sensor; a 3D CAD workstation with software to model the work cell environment and simulate the robot dynamics; a six degree of freedom forceball for operator input to the telerobotics controller and the robot simulation; and a computer with a real-time operating system. Soon to be added are a 3D viewing system and a force reflecting hand controller. This paper describes one of the research and development efforts currently in progress on this program. 3 refs., 3 figs.

7177 (UCRL-JC–108735) **Hardening automated equipment for hostile environments.** Allen, D.C. (Lawrence Livermore National Lab., CA (United States)); Hayward, M.; Sievers, R.H.; Cook, L. Lawrence Livermore National Lab., CA (United States). Nov 1991. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-911107–48: Winter meeting of the American Nuclear Society (ANS), San Francisco, CA (United States), 10-15 Nov 1991). Order Number DE92004669. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Lawrence Livermore National Laboratory (LLNL) is developing robotic systems suited to replacing human operations involving the processing of radioactive materials within glove boxes. The glove box enclosures contain a variety of hostile environmental factors that are deleterious to standard commercial robotic components. In addition to the high alpha activity encountered inside the enclosure, the equipment is expected to operated in dusty conditions with a high hardness dust. The gaseous environments include very low concentrations of oxygen and moisture within an inert nitrogen or argon fill. The radiation and the other environmental factors can be hostile to electronics, electrical-mechanical systems, and the materials of which they are composed. The developmental robotic system incorporates materials and components especially selected for improved resistance to these environments. A small commercial overhead gantry robot, the IBM electrical cantilevered robot, was modified and hardened for plutonium processing applications in a glove box. The robotic components are being tested for survivability by operating in a sealed glove box and by testing selected items separately. The results of the developmental effort are projected to be generic and suited to a wide range of DOE special nuclear material processing and system production applications.

4204 Heat Transfer and Fluid Flow

7178 (CONF-9106303–, pp. 126-127) **Mechanics/heat transfer relation for particle flows.** Campbell, C.S. (Univ. of Southern California, Los Angeles (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). Advanced Power Generation and Fundamental Research Div. Jun 1991. DOE Contract FG22-88PC88913. From University coal research program at historically black colleges and universities; Pittsburgh, PA (United States); 25-27 Jun 1991. In *Abstracts and research accomplishments of university coal research projects.* 207p. Order Number DE92003115. Source: OSTI; NTIS.

The objective is to understand the links between the mechanical behavior of a two phase mixture and its heat transfer behavior in a manner akin to Reynolds' analogy that has been long been established for simple fluids. The project studies two systems. The first is simple shear rheometers, which has clearly established a link between the apparent viscosity and thermal conductivity of dry particle flows. The second is to study fluidized beds with the intent to establish a link between the heat transfer behavior and an internal property called the 'particle pressure'. Unfortunately, no such link has been found for the latter problem and the investigation has turned toward examining the rheology of the particle pressure itself. It has been observed that bubbles generate the largest portion of the particle pressure in a gas-fluidized bed. Nearly all of the processing of fossil fuels involves chemical reactions in particle-fluid systems of one form or another, whether they be synthetic fuel retorts or basic fluidized bed crackers. All chemical processes require the addition or removal of heat in order to maintain the reaction process. Hence, understanding the relationship between the state of motion of the multiphase system and its heat transfer properties could strongly influence future designs. Furthermore, the program studying particle pressures is relevant to many studies of multiphase systems that use such quantities in mathematical modeling.

7179 (DOE/ER/13913–4) **Study of interfacial behavior in cocurrent gas-liquid flows: Progres report, November 1, 1990–October 31, 1991.** McCready, M.J. Notre Dame Univ., IN (United States). Dept. of Chemical Engineering. Nov 1991. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER13913. Order Number DE91019081. Source: OSTI; NTIS; GPO Dep.

From video images of the interface of a gas-sheared liquid layer at conditions moving away from neutral stability, a mechanism by which the two-dimensional wave field becomes unstable to transverse disturbances has been observed. It is seen that the first transverse variation is caused by a varicose instability in which two oblique modes with transverse wavenumbers $\pm k_y$ ($k_y=2\pi/\lambda_y$), and streamwise wavenumber, k_x, equal to the fundamental, appear simultaneously. Two-dimensional Fourier-Transforms show that k_y is 0 for the 2-D case (as expected) but moves off axis to a value of k_y which corresponds to a wavelength of about 5-10 cm when transverse variation is observed. A theoretical analysis based on an integral boundary-layer analysis of the Navier-Stokes equations agrees with the observed mechanism of transverse instability of finite amplitude two-dimensional waves – at least for the conditions of the experiment. Because the theory is limited to conditions where the long wavelength, small amplitude assumptions are valid, and also because no viscous boundary conditions are presently included at the side walls of our 30.5 cm wide channel, it is not known if this a generic result. Experiments are planned to investigate this further; we are presently working on a more general theory which will remove the long wavelength restriction.

7180 (EUR–13588) **CEC thermal-hydraulic benchmark exercise on Fiploc verification experiment F2 in Battelle model containment long-term heat-up phase. Results for phase I.** Fischer, K. (Battelle Institut E.V., Frankfurt am Main (DE)); Schall, M.; Wolf, L. Commission of the European Communities, Luxembourg (Luxembourg). 1991. 86p. Contract No ETSN-0045/D. Source: OSTI; NTIS (US Sales Only).

The major objective of the F2 experiment was to investigate the thermal-hydraulic long-term phenomena with special emphasis on natural convection phenomena in a loop-type geometry affected by variations of steam and air injections at different locations as well as dry energy supply into various compartments. The open post-test exercise is being performed in two consecutive phases, with Phase I covering the initial long-term heat-up phase. The exercise received widespread international attention with nine organizations from six European countries participating with seven different computer codes (FUMO, Jericho2, Fiploc, Wavco, Contain, Melcor, Cobra/Fathoms). These codes cover a broad spectrum of presently known European computational tools in severe accident containment analyses. The participants used either the specified mass flow or pressure control boundary conditions. Some exercised their codes for both. In total, 14 different computations were officially provided by the participants indicating strong interests and cooperative efforts by various institutions.

7181 (KAERI/RR–980/90) **Improvement of analysis system for core thermal hydraulic field and CHF.** Hwang, Dae Hyun (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Park, Jong Ryul; Chun, Tae Hyun; Hong, Seung Dug; Kwon, Hyuk Sung. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Mar 1991. 100p. (In Korean). Order Number DE92615043. Source: OSTI; NTIS (US Sales Only); INIS.

The objectives of this research are to establish the analysis system of thermal hydraulic field of KOFA(Korean Fuel Assembly) core using the multichannel analysis code TORC, and to improve the analysis system for critical heat flux (CHF) according to the multichannel analysis system. The thermal hydraulic models included in TORC code were reviewed, and the value of turbulent mixing parameter, which was found to be the most sensitive parameter to the variation of fuel assembly geometry, was determined from the thermal mixing test data of KOFA. The performance of the existing CHF correlations were evaluated through the CHF test data of KOFA using the TORC code models which were adjusted to KOFA. Furthermore, new CHF correlations were developed to improve the performance of CHF analysis system by using TORC code. In addition, the model for the evaluation of transition core DNBR penalty using TORC code was developed, and the application of that model for Ulchin 1/2 mixed core of KOFA and FRA-STD FA shows that about 2% of DNBR margin can be recovered in the transition core. (Author).

7182 (KFK–4850, pp. 109-116) **Investigation of phase transport mechanisms in air-water bubbly flow in vertical channels.** Class, G. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Reaktorentwicklung (IRE)); Eberle, F.; Gering, G.; Kruse, H.; Meyder, R.; Philipp, P.; Lang, G.; Sengpiel, W. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1991. (In German). In *Safety oriented LWR research. Annual report 1990.* 270p. Order Number DE92758922. Source: OSTI; NTIS (US Sales Only); INIS.

Experiments are performed at the NOVA two-phase flow test facility for investigation of the interfacial momentum exchange phenomena which result in characteristic spatial phase distributions in bubbly two-phase flow through vertical channels. They are part of two-phase flow research aiming at the capability of flow pattern analysis by adequate two-phase flow models. In the frame of the NOVA test matrix, experiments have been performed with upward and downward bubbly flows which show clearly the very distinctive development of spatial phase distributions along the test channel as a result of predominant lift forces. For measurement of turbulent static pressure in the liquid phase, the radial profile of which may have an influence on bubble migration, a static pressure probe has been developed. First measurements of static pressure profiles showed qualitatively good results. (orig./DG).

7183 (KFK–4920) **On the propagation of weak shock waves in air cleaning systems.** Neuberger, M. Kernforschungszentrum Karlsruhe GmbH (Germany). Lab. fuer Aerosolphysik und Filtertechnik (LAF); Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung; Essen Univ. (Gesamthochschule) (Germany). Fachbereich 12 - Maschinentechnik. Aug 1991. 135p. (In German). Order Number DE92750156. Source: OSTI; NTIS (US Sales Only); INIS.

In order to be able to calculate HEPA filter margins, both the mechanical loading at the service location and the structural strength of the filter unit must be known. This makes necessary the development of suitable computer codes for modelling fluid dynamic transients and, for extreme accidents, the propagation of weak shock waves. So the interaction of a shock wave with a junction of a straight duct having a side branch is considered. The paper checks the validity of two hypotheses. The first one calculates the shock waves after the junctions only by a geometrical consideration. A comparison with experimental values shows only an unsatisfactory result for weak shock waves. The second theory assumes that the pressure drop across the junction, in the quasi-steady flow which takes place after the incident shock waves, is the same as in steady flow tests. The pressure drops were measured for different junctions and the results of the calculation were compared with experimental values from a shock tube, both for circular and rectangular channels. A good agreement was obtained. Also the interaction of a shock wave with a channel of varying cross section is considered. So a new theory to calculate the changes in shock strength after a nozzle and a diffuser is described. There is the possibility to calculate reflected waves, as shock waves in front of a converging channel and a expansion wave in front of a diverging channel. Also the problem of the influence of dissipation to the change in shock strength is solved. The theory calculates the pressure drop of the 'shock-shock', which takes place in a diffuser, if the flow is accelerated to the velocity of sound from a strong expansion wave. The shock strength was measured for different area ratios and the results of the calculation were compared with experimental values from a shock tube. A good agreement was obtained. (orig.).

7184 (PSI–104) **Assessment of RELAP5/MOD2, Cycle 36.02, using NEPTUN reflooding experimental data: International code assessment programme.** Richner, M. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Analytis, G.T.; Aksan, S.N. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Oct 1991. 98p. (NUREG/IA–00103.). Order Number DE92613719. Source: OSTI; NTIS (US Sales Only); INIS.

Seven NEPTUN reflooding experiments with varying parameters flooding rate, single rod power, pressure and initial rod temperatures were simulated with the code RELAP5/MOD2, version 36.02, to assess the code, especially its reflood model. These calculations were performed with the specific objectives of evaluating the general prediction capability as well as specific problem areas of the RELAP5/Mod2 code in modelling boil-off and reflood behavior. First a study of the effect of the hydraulic and conduction nodalization to the results of the code was performed using a high and a low flooding rate experiment. After the choice of a proper nodalization, base calculations were done for all seven NEPTUN reflooding tests. The differences between code predictions and experiments are described and analysed. Implementing new correlations into the code and modifying or correcting existing correlations, for example for wall heat transfer or interphase friction, some of the weak points of the code during reflooding could be identified. These modifications were checked with all seven NEPTUN experiments. Additionally, two FLECHT-SEASET tests were simulated with the frozen version and also with the modifications mentioned above. (author) 60 figs., 4 tabs., 17 refs.

7185 (UCRL–53868-90, pp. 2.1-2.2) **TOPAZ2D quality assurance.** Shapiro, A.B. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

This year the authors began a software quality assurance program to validate the TOPAZ2D heat transfer code. Their objective is to develop an automatic test suite of benchmark problems that exercise different paths through the program to verify that the program's actual structure matches its intended structure. To date they have run and documented 20 problems.

7186 (UCRL–53868-90, pp. 2.28-2.30) **MONT3E and MONT3D Monte Carlo heat-transfer codes.** Maltby, J.D. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The MONT3E and MONT3D codes calculate heat transfer due, respectively, to electron backscatter and to thermal radiation. Both codes calculate heat transfer in a similar manner and for the same simulated environment: a three-dimensional shaded enclosure without a participating medium. For MONT3E problems, the enclosed space includes a spatially variable magnetic field. Beginning FY 91, MONT3D capability will also include problems involving a participating medium. Current work involves modifying the codes to run on multiple RISC processors, which are well suited to the codes' characteristics. A new magnetic-field preprocessor and improved graphics for MONT3E are briefly discussed.

7187 (UCRL–53868-90, pp. 2.3-2.6) **Code acquisition and development project of the thermo-fluid mechanics group.** Stein, W. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The Thermo-Fluid Mechanics Group identifies, acquires, and develops computer codes that solve fluid-flow and heat-transfer problems. Current work includes: modifying KIVA-11, a time-dependent code that uses finite-volume methods to model compressible flow and heat transfer in three dimensions, the modifications expand the code's ability to handle a greater variety of boundary conditions and geometrical shapes, thereby enabling the code to solve a wider range of problems; updating the SLIC mesh-generator user's manuals; developing an examples manual for the TOPAZ2D finite-element heat-transfer code; modifying the three-dimensional incompressible-flow and heat-transfer code, LMT, to include capabilities to solve turbulent-flow problems.

7188 (ANL/CP–73611) **Shaping particles for ultramicrotomy.** Bradley, C.R.; Dietz, N.L.; Bates, J.K. Argonne National Lab., IL (United States). [1991]. 6p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract W-31109-ENG-38. (CONF-911202–16: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92005242. Source: OSTI; NTIS; GPO Dep.

A technique for preshaping large particles of reacted glass for ultramicrotomy is described. This technique preserves delicate surface layers and results in more sections per block extending deeper into the sample than other techniques.

7189 (ANL/CP–74775) **Residual and applied stress measurements at IPNS.** Richardson, J.W. Jr. Argonne National Lab., IL (United States). [1991]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9103130–5: North Atlantic Treaty Organization (NATO) advanced research workshop on measurement of residual stress and applied stress using neutron diffraction, Oxford (United Kingdom), 18-22 Mar 1991). Order Number DE92004127. Source: OSTI; NTIS; GPO Dep.

The Intense Pulsed Neutron Source (IPNS) at Argonne National Laboratory has operated as a user facility since 1981. From the early days on, highly precise measurement of structural parameters including lattice constants has been a major objective of developments on the powder diffractometers at IPNS. The General Purpose Powder Diffractometer (GPPD) combines excellent instrumental resolution – roughly independent of d-spacing – with good neutron flux to provide an exceptional tool for the measurement of residual and applied stresses.

7190 (FhG-IWM-W–5/90) **A new approach to intensity and background corrections for roentgenographic residual stress measurement using the ω-diffractometer.** Pfeiffer, W. Fraunhofer-Institut fuer Werkstoffmechanik, Freiburg im Breisgau (Germany). Feb 1991. 46p. (In German). Order Number DE92758983. Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the correction of intensity distributions of diffraction lines and background radiation for roentgenographic residual stress determination. The x-ray physical fundamentals of various effects influencing both the measurable intensity distribution of diffraction lines and different proportions of background radiation are compiled and a new method of intensity and background correction is derived. The new approach is tested and verified using residual stress analyses of different material conditions with different levels of background radiation. The results show that the method provides quantitatively correct residual stress analyses even in cases where the previously common procedure for intensity and background correction fails. (orig./MM).

Neutron radiography technique is used for showing the viability of inspecting hydrogenated materials. The experimental disposition is installed in irradiation radial channel n. 10 from IEA-R1 (IPEN-CNEN-SP). The inspetionated materials were munitions for gun and rifle. (C.G.C.).

7194 (KAERI/RR–968/90) **Analysis of the irradiation creep and growth of KMRR structural materials of zircaloy-4.** Rheem, Karp Soon (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Seon Jin; Han, Jung Ho; Jeong, Young Hwan; Lee, Deuk Hyun; Park, Gi Sung. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1991. 63p. (In Korean). Order Number DE92615086. Source: OSTI; NTIS (US Sales Only); INIS.

With relation to the dimensional stability and mechanical integrity of the KMRR core Zircaloy-4 structures during long-term irradiation, in-pile creep/growth behaviors of Zircaloy-4 were investigated by means of stress relaxation tests under neutron irradiation in TRIGA MK-III reactor to secure optimum conditions for the fabrication of of Zircaloy structure for dimensional stability. Since the Zircaloy core structure would be β-treated to maximize dimensional stability, the optimum condition for increasing the toughness as well as strength of β-treated Zircaloy was also investigated. The cooling rate of 5 deg C/sec to 110 deg C/sec was found to show the maximum toughness and strengh. In the in-pile stress relaxation tests under the fast neutron flux of 1.2×10^{17} n/m^{2}sec at 373 deg K in core of the TRIGA Mark-III reactor, the 50 μm thick foils of α/β heat treated Zircaloy-4 specimens showed that creep strain of α-annealed specimens is slightly higher than that of β-annealed specimens. From the result, plate matrix and its welded parts of Zircaloy-4 structures would be negligible when the Zircaloy core materials are properly β-heat treated. Low cycle fatigue life and strength were measured for the α/β heat treated and proton beam irradiated specimens. The fatigue life of β-annealed specimens reduced to 1/5 of that of the α-annealed. Reduction in fatigue life of β-annealed specimens was attributed to the annihilation of textured structures during the cycling of Zircaloy specimens. The effect of proton beam irradiation on the low cycle fatigue life was negligible at room temperature. (Author).

7195 (STU-I–773-1990) **Control of the development of residual stresses and heat affected zone (HAZ) microstructure during welding of low alloy steels and influence on stress relieve cracking.** Storesund, J. (Swedish Inst. for Metals Research, Stockholm (Sweden)); Rui Wu; Sandstroem, R.; von Walden, E. Swedish National Board for Technical Development, Stockholm (Sweden). 1990. 178p. (IM–2619;IM–2705;IM–2706.). Order Number DE92613770. Source: OSTI; NTIS (US Sales Only); INIS.

Creep resistant 1 Cr 0.5 Mo steels are frequently used as steam pipes at operating temperature of 450 degree C to 500 degrees C. Welded joints have been post weld heat treated (PWHT). The results show: - In fully refined microstructures close to the fusion boundary of the weldments a reduction of the grain size by a factor of 3-4 was measured. The impact transition temperature was up to 27 degree C lower for test series notched in the refined HAZ (Heat Affected Zone) than in the coarse grained HAZ of the as welded condition. The overlay heat treatments were not observed to significantly influence the hardness and the room temperature tensile properties of the weldments. - The influence of refinement on impact transition temperature (ITT) and upper shelf energy was beneficial. In the coarse grained HAZ, for which the ITT was significantly higher than for weld metal and base metal, the refinement resulted in a 30 degrees C lower value of the ITT. The influence of PWHT on impact properties was also studied. The PWHT raised the upper shelf energy greatly. The effect on the ITT was smaller than that of refinement. - For cross welds in the as-welded (AW) condition refinement improved the creep properties. After PWHT the creep ductility was significantly increased at the same as a considerable reduction of life was observed. At lower stresses the effects of refinement and especially PWHT were less pronounced. Beneficial influence of refinement in inhibiting the formation of creep cavitation was apparent regardless stress level in both AW and PWHT conditions. (K.A.E).

7196 (STU-I–774-1990) **Crack initiation and propagation in welded joints of turbine and boiler steels during low cycle fatigue.** Lindblom, J. (Swedish Inst. for Metals Research, Stockholm (Sweden)); Sandstroem, R.; Linde, L.; Henderson, P. Swedish National Board for Technical Development, Stockholm (Sweden). 1990. 122p. (IM–2646;IM–2699.). Order Number DE92613771. Source: OSTI; NTIS (US Sales Only); INIS.

Low cycle fatigue (LCF) tests have been performed at 300 and 565 degrees C on welded joints and on microstructures to be found in or near welded joints in a low alloy ferritic steel 0.5 Cr, 0.5 Mo, 0.25 V. The difference in lifetimes between the 300 degrees C and 565 degrees C tests was small comparing the same microstructures and strain ranges, although the stress amplitude was greater at 300 degrees C. Under constant stress conditions the fatigue life depended on the fatigue life of the parent metal but under constant strain conditions the lifetime was governed by that of the bainitic structures. Strain controlled LCF tests have been performed at 750 degrees C on welded joints in the austenitic steel AISI 316 and on different parent and weld metals used in these joints. In continuously cycled samples all cracks were transgranular and initiated at the surface; hold-time samples displayed internally initiated intergranular cracking in the weld metal. Under constant strain conditions the 316 parent and weld metals exhibited similar lifetimes. When considering a constant stress situation the strength of the microsturctures decreased in the following order: Sanicro weld metal, cold deformed parent metal, undeformed parent metal and weld metal (K.A.E.).

7197 (UCRL–53868-90, pp. 7.1-7.3) **Laser generation and detection of ultrasonic energy.** Thomas, G.H.; Lewis, D.K.; Wagner, J.W. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

In nondestructive evaluation (NDE) of a specimen using ultrasonic acoustic energy, an ultrasonic generator directs the energy into the object while a detector, or detectors, on the exterior of the object records the emerging energy, thus providing data from which anomalous conditions such as voids or cracks inside the object can be deduced. Traditional ultrasonic NDE methods require a fluid acoustic couplant between the object being examined and the generator and detector of the ultrasonic energy. This need for acoustic coupling prohibits applying traditional methods when contamination of the object is possible or when the object is in a hostile environment often present in processing operations. The authors are studying the ability of lasers to generate and detect ultrasonic acoustic energy in objects at a distance, with the idea of developing a new technique of ultrasonic NDE that could be carried out without touching the object being examined and hence would widen the applicability of the method.

7198 (UCRL–53868-90, pp. 7.14-7.41) **Computerized tomography.** Martz, H.E.; Perkins, D.E.; Schneberk, D.J.; Azevedo, S.G.; Skeate, M.F.; Roberson, G.P. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors are developing several data-acquisition scanners for computerized tomography (CT) along with associated computational techniques for image reconstruction, analysis, and display. They report here on recent progress in scanner development, reconstruction algorithm research, and applications work. They have sought to advance the state of the art in CT technology while at the same time actively supporting programs. Their goal is to provide reliable and efficient nondestructive evaluation techniques to use in probing the internal structure of fabricated objects and materials associated with a broad spectrum of Laboratory-wide programs.

7199 (UCRL–53868-90, pp. 7.4-7.5) **Quantitative radiography by image digitization without film.** Dolan, K.W.; Ryon, R.W. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

Digital x-ray images are traditionally obtained from a multiple step process involving film exposure, film processing, and film digitization. Nonlinearities introduced at each stage of this process make it difficult to obtain accurate, quantitative information from digitized radiographs. There are at least two methods to eliminate nonlinearities in image digitization. One method makes use of photostimulable phosphor storage plates. The phosphor plates store x-ray exposure images through the process of electronic transitions into trapped lattice sites forming metastable color centers. The plates are read out using a scanning laser beam to stimulate light emission and a photomultiplier tube to measure light output. This technology is gaining acceptance in medical radiology where decreased dosages and higher contrast relative to film have been demonstrated. A second method uses linear diode arrays in which the image is digitized directly from the response of the diode elements. Both of these methods offer high throughput capability, wide dynamic range, and spatial resolution comparable to the faster film digitizing systems, e.g. 5 line pairs per mm. Although neither method offers the spatial resolution inherent in a film image, which can be better than 100 line pairs per mm, the potential for obtaining quantitative information from the digitized images at high throughput rates provides distinct advantages over traditional film radiography.

7200 (UCRL–53868-90, pp. 7.6-7.8) **X-ray optics for microimaging and other applications.** Ryon, R.W. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors are developing x-ray optics primarily so that they can perform scanning x-ray microscopy utilizing fluorescence and other interactions. By this means, they can produce high-resolution images of material characteristics such as chemical composition, electron density, or bulk density. The principal technique they have been employing is known as Kirkpatrick-Baez mirror optics. In this technique, the mirrors effectively increase the efficiency of the system by gathering and focusing the x-ray photons produced by a conventional x-ray source. Most x-ray microscopy to date has been done with soft x rays (<1 keV); they, however, started at 8 keV and are ready to extend the capability to 20 keV. They have also designed a similar system to produce a parallel beam of x rays for long-distance alignment applications. Most of the components for this parallel-beam system are built and ready for testing.

7201 (ENEA-RT-INN–90-17) **Compact kinetic code for discharge pumped XeCl laser modelling.** Letardi, T.; Fu, S.; Fang, H. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 11p. (CONF-900368–12: International congress on optical science and engineering, The Hague (Netherlands), 12-16 Mar 1990; RT/INN–90-17). Order Number DE92744021. Source: OSTI; NTIS (US Sales Only).

From International congress on optical science and engineering SPIE 1990; The Hague, Netherlands (12-15 Mar 1990).

A compact kinetic code for the theoretical modelling of discharge pumped XeCl lasers was developed and used to model the performance and discharge characteristics of x-ray pre-ionized lasers. The results are in good agreement with the experiments. This paper discusses in detail the effects of superelastic and electron-electron collisions which are neglected in the compact code on the modelled results.

7202 (ENEA-RT-INN–90-36) **Observation of coherent mm wave radiation from microtron driven Cherenkov FEL.** Ciocci, F.; Doria, A.; Gallerano, G.P.; Giabbai, I.; Kimmitt, M.F.; Messina, G.; Renieri, A.; Walsh, J.E. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta; Essex Univ., Colchester (United Kingdom); Dartmouth Coll., Hanover, NH (United States). Dept. of Physics and Astronomy. Jun 1991. 12p. (CONF-901293–2: International conference on lasers '90, San Diego, CA (United States), 3-7 Dec 1990; RT/INN–90-39). Order Number DE92744007. Source: OSTI; NTIS (US Sales Only).

From International conference on lasers '90; San Diego, CA, USA (10-14 Dec 1990).

Low energy radio frequency (r.f.) electron beam (e-beam) sources have a potential application as drivers for FELs (free electron lasers) operating in the far-infrared and sub-millimeter (sub-mm) region since they can provide short pulses of coherent radiation in a spectral region not covered by conventional laser sources. A 5 MeV microtron capable of delivering 20 ps bunches with a 4A peak current was utilized at the ENEA (Italian Commission for Nuclear and Alternative Energy Sources) sub-mm FEL facility to drive a Cherenkov free electron laser designed to operate in the spectral region from 100 microns to 2 mm. In this type of device, a beam of relativistic electrons excites TM-like surface waves in a dielectric loaded waveguide when their velocity is close to the phase velocity of the wave in the guide. The longitudinal component of the evanescent electric field causes a bunching of the electrons giving rise to stimulated emission. This paper reports the observation of coherent emission in the microtron driven Cherenkov FEL when power up to 50 W in 4 micron pulses was generated at the wavelengths of 1.6 mm and 0.9 mm by using two different dielectric loaded waveguides. Tunning results obtained by varying the waveguide gap are also reported.

7203 (ENEA-RT-INN–90-38) **Towards generalized version of Madey's theorem.** Dattoli, G.; Giannessi, L.; Mezi, L.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 13p. (RT/INN–90-38). Order Number DE92744019. Source: OSTI; NTIS (US Sales Only).

The paper shows that longitudinal and transverse mode correction to the FEL (free electron laser) low gain formula can be expressed by means of higher order derivatives of the complex spontaneous emission function. The analysis is then extended to the high gain regime.

7204 (ENEA-RT-INN–90-51) **Intensity saturation mechanism in free electron lasers.** Dattoli, G.; Giannessi, L.; Cabrini, S. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 11p. (RT/INN–90-51). Order Number DE92743980. Source: OSTI; NTIS (US Sales Only).

The gain saturation mechanism of a free electron laser (FEL) is different from that of a conventional laser. Furthermore, the interaction itself causes an energy loss of the electron beam and induces an energy spread, thus determining the saturation of the system itself. Albeit apparently different, the FEL gain saturation mechanism is reproduced by an equation analogous to that exploited for conventional lasers. This paper proves that the FEL exhibits a scaling of the gain saturation versus intensity which is analogous to that of conventional lasers; introduces the concept of FEL intensity of saturation and finds its expression in terms of the system parameters; and finds a simple relationship between FEL output intensity and saturation intensity.

7205 (ENEA-RT-INN–90-55) **Study of self-preionized XeCl electron-avalanched discharges.** Letardi, T.; Bollanti, S.; Di Lazzaro, P.; Flora, F.; Zheng, C.E. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Apr 1991. 24p. (RT/INN–90-55). Order Number DE92743978. Source: OSTI; NTIS (US Sales Only).

Preionization of laser gases has proved to be an effective means of initiating a homogeneous discharge at gas pressures higher than one atmosphere, and some papers have been published on preionization requirements for obtaining a homogeneous discharge. Several experimental approaches have been carried out regarding the development of preionization sources. One of the simplest is to use a pin array on the cathode surface to produce a corona discharge which emits photoionizing radiation. By applying a fairly slow-rising discharge voltage with a rise time of about 1 microsec (from 10% to 90%) to this kind of electrode, over 1 J of XeCl laser output energy per pulse, with a pulse duration of about 120 ns (FWHM) and a spot size of 2x7 square centimeters in the near field, was obtained. The device is attractive in its simplicity, as it has neither an additional preionization circuit nor a low-inductance switch between the discharge chamber and pulse-forming line, although the laser efficiency may be rather low. In this paper, based on previous works, the conditions necessary for the formation of a spatially diffuse discharge in this kind of electrode configuration are analyzed, and some characteristics of the discharge at the streamer-formation stage are calculated and compared with the experimental observations.

7206 (ENEA-RT-INN–90-57) **Simple model of gain saturation in free electron lasers.** Dattoli, G.; Giannessi, L.; Cabrini, S. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 9p. (RT/INN–90-57). Order Number DE92744014. Source: OSTI; NTIS (US Sales Only).

This paper analyzes the dynamics of a free electron laser (FEL) in the strong signal regime. A parallel is drawn with the dynamics of a conventional laser. A simple model of gain saturation is developed, and a scaling relation of gain versus the intra-cavity laser intensity is derived.

7207 (ENEA-RT-INN–90-58) **Discharge dynamics study of self-sustained XeCl lasers.** Letardi, T.; Fang, H.Y.; Fu, S. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 14p. (RT/INN–90-58). Order Number DE92744010. Source: OSTI; NTIS (US Sales Only).

Discharge dynamics is crucial for self-sustained discharge pumped XeCl lasers. The stability of the discharge not only limits the energy deposition and laser pulse duration, but also plays a very important role in the laser output beam quality, e.g., intensity spatial distribution, beam divergence, etc. Many efforts have been made, both theoretically and experimentally, to improve discharge stability, and numerous papers devoted to this subject have been published. This paper presents some results of discharge dynamics studies on self-sustained XeCl lasers. The investigations were performed using a kinetic code that included the Boltzmann equation, species density rate equations, and circuit equations. The discharge process was divided into four stages: the initial stage, from spark gap switch-on to the static breakdown field; avalanche build-up stage, from the point at which the gas mixture resistance starts to decrease, to the quasi-steady-state discharge occurrence; quasi-steady-state stage, during which the resistance of the gas mixture and the voltage on the discharge gap are nearly constant; terminal stage, when the lasing stops.

7208 (ENEA-RT-INN–90-59) **Free electron lasers: Contributions to 12th international conference.** ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Apr 1991. 39p. (CONF-9009166–Exc.: 12. international free electron laser conference (FEL-12), Paris (France), 17-21 Sep 1990; RT/INN–90-59). Order Number DE92744002. Source: OSTI; NTIS (US Sales Only).

From 12. International free electron laser conference; Paris, France (17-21 Sep 1990).

Separate abstracts were prepared for three contributions to the 12th International Conference on Free Electron Lasers (FELs). The papers included the following: a discussion, in the small signal small gain approximation both in the homogeneous and inhomogeneous broadening regimes, of the dispersion properties of a guiding structure giving rise to new kinematic and dynamic properties of a free electron laser waveguide; the observation of coherent emission from a Cherenkov FEL driven by a 5 MeV radio frequency microtron; a review of the FEL wave equation accounting for longitudinal or/and transverse mode dynamics in the small signal regime within the context of a general operator approach to non-local integro-differential equations.

7209 (ENEA-RT-INN–90-66) **Extraction efficiency of laser active medium: Optimization.** Flora, F.; Hermsen, T. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 22p. (RT/INN–90-66). Order Number DE92744024. Source: OSTI; NTIS (US Sales Only).

In the design of high power laser sources, the choice of the active medium geometry is of fundamental importance for the optimization of energy extraction capability. This paper compares, by means of simple analytical deductions and numerical simulations, the energy extraction efficiency of different optical configurations ranging from simple resonators such as the plano-plano, the confocal positive branch, or the self-filtering unstable (SFUR) up to more complex systems like multi-pass amplifiers or combined oscillator-amplifiers (MOPA).

7210 (ENEA-RT-INN–90-71) **MOPA FEL Stanford experiment: Simple analysis.** Dattoli, G.; Giannessi, L.; Torre, A.; Fang, H. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. May 1991. 12p. (RT/INN–90-71). Order Number DE92744005. Source: OSTI; NTIS (US Sales Only).

This paper analyzes the results of the FEL (free electron laser) MOPA (master oscillator power amplifier) experiment recently performed at Stanford. A one dimensional model is used and the observed violation of the Madey's theorem is quantitatively reproduced. This note, albeit based on a one dimensional analysis, supports the hypothesis that the observed deviations from Madey's theorem may be essentially due to high gain effects. However, since the inhomogeneous broadening effects strongly suppress the high gain contributions, it can also be argued that most of the observed phenomena are due to the interplay between the high gain dynamics and the modifications induced by the beam energy spread.

7211 (LAMP–91/2) **Development of tunable flashlamp excited dye laser system.** LAMP series report (Laser, Atomic and Molecular Physics). Bhanthumnavin, V. (International Centre for Theoretical Physics, Trieste (Italy)); Apikitmata, S.; Kochareon, P. International Centre for Theoretical Physics, Trieste (Italy). May 1991. 9p. Order Number DE92611160. Source: OSTI; NTIS (US Sales Only); INIS.

A tunable flashlamp excited dye laser (FEDL) was successfully developed for the first time in Thailand by Thai scientists at KMIT Thonburi (Bangmod). The Rhodamine 6G dissolved in ethyl alcohol was utilized as a laser medium and circulated by a pump through a laser head. The dye cuvette had an inner diameter of 4.0 mm and was 90 mm long. The cavity mirrors M_1, and M_2 were concave mirrors with reflectivities of 100% and 73% respectively. A power supply of 0-20 kV and current of 0-50 mA charged a capacitor of 0.3 μ f at 10-15 kV which was then discharged via a spark gap through the flashlamp. The output laser wavelengths was tunable from λ = 550-640 nm. It is the first FEDL system, locally developed, which has a tunable wavelength for the laser output. The laser pulse width is about 1.0 μs with energy of 20 mJ and peak power pf 20 KW. The repetition rate of the laser is 1/15 Hz. (author). 14 refs, 7 figs.

7212 (LA-UR-91-3526) **Measuring neutron fluences and gamma/x-ray fluxes with CCD cameras.** Yates, G.J. (Los Alamos National Lab., NM (United States)); Smith, G.W.; Zagarino, P.; Thomas, M.C. Los Alamos National Lab., NM (United States). [1991]. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-911106–29: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92003863. Source: OSTI; NTIS; INIS; GPO Dep.

The capability to measure bursts of neutron fluences and gamma/x-ray fluxes directly with charge coupled device (CCD) cameras while being able to distinguish between the video signals produced by these two types of radiation, even when they occur simultaneously, has been demonstrated. Volume and area measurements of transient radiation-induced pixel charge in English Electric Valve (EEV) Frame Transfer (FT) charge coupled devices (CCDs) from irradiation with pulsed neutrons (14 MeV) and Bremsstrahlung photons (4–12 MeV endpoint) are utilized to calibrate the devices as radiometric imaging sensors capable of distinguishing between the two types of ionizing radiation. Measurements indicate $\approx$.05 V/rad responsivity with $\geq$1 rad required for saturation from photon irradiation. Neutron-generated localized charge centers or "peaks" binned by area and amplitude as functions of fluence in the 10^5 to 10^7 n/cm^2 range indicate smearing over $\approx$1 to 10% of CCD array with charge per pixel ranging between noise and saturation levels.

7213 High voltage bipolar-CMOS structure using porous silicon. Guilinger, T.R.; Kelly, M.J.; Tsao, S.S. To Dept. of Energy. 1990. Filed date 8 May 1990. USA Patent patent application 7-520,475. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004613. Source: OSTI; NTIS; GPO Dep.

A method for integrating a silicon-on-insulator device and a bulk bipolar device on a semiconductor body. The invention simultaneously forms the two regions for the silicon-on-insulator device and the bipolar device. The invention enables a high voltage CMOS power device to be located on the same chip as a bipolar logic device enabling smart power devices.

7214 Rectifier cabinet static breaker. Costantino, R.A.; Gliebe, R.J. To Dept. of Energy. 1990. Filed date 30 May 1990. USA Patent patent application 7-530,513. 27p. Sponsored by National Aeronautics and Space Administration. Contract N00024-79-C-4026. Order Number DE92004620. Source: OSTI; NTIS; GPO Dep.

A rectifier cabinet static breaker replaces a blocking diode pair with an SCR and the installation of a power transistor in parallel with the latch contactor to commutate the SCR to the off state. The SCR serves as a static breaker with fast turnoff capability providing an alternative way of achieving reactor scram in addition to performing the function of the replaced blocking diodes. The control circuitry for the rectifier cabinet static breaker includes on-line test capability and an LED indicator light to denote successful test completion. Current limit circuitry provides high-speed protection in the event of overload.

7215 Electrical grounding prong socket. Leong, R. To Dept. of Energy. 1990. Filed date 31 May 1990. USA Patent patent application 7-531,437. 29p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003740. Source: OSTI; NTIS; GPO Dep.

The invention is a socket for a grounding prong used in a three prong electrical plug and a receptacle for the three prong plug. The socket being sufficiently spacious to prevent the socket from significantly stretching when a larger, U-shaped grounding prong is inserted into the socket, and having a ridge to allow a snug fit when a smaller tubular shape grounding prong is inserted into the socket. 17 figs.

7216 Apparatus and process for active pulse intensity control of laser beam. Wilcox, R.B. To Dept. of Energy. 1990. Filed date 19 Jun 1990. USA Patent patent application 7-540,237. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003810. Source: OSTI; NTIS; GPO Dep.

An optically controlled laser pulse energy control apparatus and process is disclosed wherein variations in the energy of a portion of the laser beam are used to vary the resistance of a photodetector such as a photoresistor through which a control voltage is fed to a light intensity controlling device through which a second portion of the laser beam passes. Light attenuation means are provided to vary the intensity of the laser light used to control the resistance of the photodetector. An optical delay path is provided through which the second portion of the beam travels before reaching the light intensity controlling device. The control voltage is supplied by a variable power supply. The apparatus may be tuned to properly attenuate the laser beam passing through the intensity controlling device by adjusting the power supply, the optical delay path, or the light attenuating means. 3 figs.

7217 Counterrotating brushless dc permanent magnet motor. Hawsey, R.A.; Bailey, J.M. To Dept. of Energy. 1990. Filed date 30 Jul 1990. USA Patent patent application 7-559,030. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92003825. Source: OSTI; NTIS; GPO Dep.

An brushless DC permanent magnet motor is provided for driving an autonomous underwater vehicle. In one embodiment, the motor comprises four substantially flat stators disposed in stacked relationship, with pairs of the stators being axially spaced and each of the stators comprising a tape-wound stator coil; and a first and second substantially flat rotors disposed between the spaced pairs of stators. Each of the rotors includes an annular array of permanent magnets embedded therein. A first shaft is connected to the first rotor and a second, concentric shaft is connected to the second rotor, and drive unit causes rotation of the two shafts in opposite directions. The second shaft comprises a hollow tube having a central bore therein in which the first shaft is disposed. Two different sets of bearings support the first and second shAfts. In another embodiment, the motor comprises two ironless stators and pairs and rotors mounted no opposite sides of the stators and driven by counterrotating shafts.

7218 (SAND-91-1367C) **The use of modal analysis in the development of advanced lithography machines.** Roach, D.P. Sandia National Labs., Albuquerque, NM (United States). [1991]. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-920234–2: 10. international modal analysis conference (IMAC), San Diego, CA (United States), 3-6 Feb 1992). Order Number DE92004742. Source: OSTI; NTIS; GPO Dep.

The use of modal analysis as a diagnostic tool is rapidly increasing. This paper describes a unique application of this technology in the analysis of an advanced lithography machine. This machine, a "step-and-repeat" system, uses a photographic process to print electronic circuit patterns on wafers with resolutions on the order of nanometers. Consequently, it is imperative for the structural response to be controlled during the machine's normal operations. Modal, vibration, and timing control experiments were conducted in order to assess the various design features which provide optimum machine performance. It was determined that the vibration sources and the stiffness of the machine components are tailored to complement each other such that all potential problem areas are avoided. In addition, special design features are employed to allow the machine to quickly optimize conditions – such as wafer residual motion and positioning error – prior to wafer exposure. The ultimate goal of this investigation is to provide guidelines to improve the accuracy and reliability of lithography equipment and to aid in the development of more advanced machines. 7 refs., 10 figs.

7219 (UCRL–53868-90, pp. 1.14-1.18) **Modeling pulse-driven antennas.** McLeod, R.R.; Pennock, S.T.; Barth, M.J. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors describe an accurate and versatile back-projection technique that predicts field values for pulse-driven microwave antenna systems anywhere in space, given experimental data from only one or a few points. Their approach first models the near-field environment of the antenna system with a standard finite difference time domain electromagnetic modeling code, and then transforms the resultant near-field information to the far field. This technique is valuable in a number of Laboratory programs. For example, intelligence measurements of antenna radiation, combined with knowledge of the antenna itself, can be used as a means of identifying the source.

7220 (UCRL–53868-90, pp. 1.24-1.27) **Localized wave transmission.** Lewis, D.K. (Lawrence Livermore National Lab., CA (United States)); Ziolkowski, R.W. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors are investigating localized wave (LW) transmission, in which the wave energy theoretically does not spread or diminish in amplitude even when propagated over extreme distances. They are using computer modeling and experiments to study the launching and propagation characteristics of LW fields and to investigate potential wave-launching systems. Their current LW experiments to substantiate theory are being performed in an acoustic environment with a launching system consisting of a 25-element array driven by six individually tailored drive signals, at an effective ultrasonic frequency of 320 kHz. Using this same array, they compared the LW results with conventional monochromatic (continuous-wave) tone bursts at 500 kHz. They have achieved the LW effect well beyond 10 Rayleigh distances.

7221 (UCRL–53868-90, pp. 1.28-1.34) **Modeling strained-layer semiconductor superlattices at Lawrence Livermore National Laboratory.** Mailhiot, C.; Khanaka, G.H.; White, W.T. III; Yee, J.H. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

Lawrence Livermore National Laboratory grows superlattice materials for a variety of photonic and electronic devices, including diode lasers and fast, sensitive detectors. To help design, test, and evaluate these novel materials, the authors have recently implemented a boundary-condition method for modeling superlattices, based on $k \cdot p$ techniques. The method is well suited for strained-layer superlattices, and it provides good accuracy in computing energy-band structure near the band edge. By using a large number of zone-center basis functions, they have extended the domain of validity to the entire Brillouin zone. They have applied the new superlattice codes to a variety of problems at LLNL, including infrared photodetectors, electroabsorption optical modulators, and electron transport.

7222 (UCRL–53868-90, pp. 1.6-1.13) **Quantum-well laser modeling.** Wahlstrand, K.J.; Yee, J.H.; Mariella, R.P. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

In recent quantum-well laser modeling, the authors computed the threshold current density as a function of laser-cavity length and compared the resultant values with experiments to validate their calculations. They also obtained new results, including gain with k-selection for several GRIN-SCH potentials of differing shapes; pulse compression in photon density vs energy in the steady-state, rate-equation solutions; and relaxation oscillations observed in transient rate-equation solutions, using gain with k-selection. They observed that multiple-quantum-well potentials show a narrower gain spectrum than single-quantum-well potentials, and that oscillation frequency is linear in the square root of the power, in agreement with experiments.

7223 (UCRL–53868-90, pp. 2.15-2.22) **Microchannel cooling optimization model.** Landram, C.S. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

Electronic circuits are often cooled by pumping a fluid through a microscopic array of thermally conducting fins. Modeling the optimum configuration for such a device is a surprisingly complex problem. A numerical model is presented for calculating an optimal microchannel geometry that will minimize semiconductor operating temperatures.

7224 (UCRL–53868-90, pp. 3.1-3.5) **Gallium arsenide CCDs for high-speed transient recording.** Cooper, G.A.; Davidson, J.C.; Swierkowski, S.P. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The goal of this project is to design and fabricate gallium arsenide charge-coupled devices (CCDs) for imaging and transient-recording applications where sampling rates of 1 to 2 GHz are required. The authors have added a resistive gate process that has improved the charge transfer efficiency (CTE) of their devices, and they have established a modeling capability to explore design changes that could improve their performance.

7225 (UCRL–53868-90, pp. 3.10-3.12) **Microresonator laser array research.** McConaghy, C.F.; Mariella, R.P. Jr. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

Microresonator lasers with cavity lengths of 1.6 μm and mirror reflectivities over 99% were fabricated in GaAs by molecular beam epitaxy (MBE). Optical reflectivity data showed clear Fabry-Perot resonances, and the microresonator lasers lased single mode at wavelength near 850 nm when optically pumped by a dye laser at a wavelength of 796 nm. Streak camera measurements of the microresonators showed response times near 12 ps.

7226 (UCRL–53868-90, pp. 3.13-3.16) **Ion-assisted etching and deposition for microelectronics and microoptics.** Miller, D.E.; Folta, J.A. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

This is the second year of a proposed three-year research and technology development effort to enhance the materials-processing capabilities for microfabrication of advanced ultra-high-speed electronics and optical microstructures. Ion-assisted etching technically includes the more familiar methods of reactive-ion etching and plasma etching. In both of these dry etching techniques, the substrate being etched to form microstructues is immersed in a plasma. The principal focus of their project has been on ion-beam etching (IBE), or ion milling. With IBE, an ion-generating plasma is excited in a chamber separate from the main vacuum chamber that contains the substrate. This IBE arrangement allows dramatic variations in substrate-angle-ndependent etching and separate control of the relative values of the chemical and physical mechanisms that constitute the etching process.

7227 (UCRL–53868-90, pp. 3.21-3.24) **Infrared-sensitivie photocathodes.** Mariella, R.P. Jr. (Lawrence Livermore National Lab., CA (United States)); Cooper, G.A.; Behrendt, W.; Liliental-Weber, Z. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

Photocathodes that can respond to infrared light with useful sensitivities are not available commercially. The long-term objective of their project, started in FY 91, was to make such photocathodes. In preparation for growing IR-active photocathodes this year, they used their molecular beam epitaxy machine (MBE) to grow

$In_yGa_{1-y}As/GaAs$ strained-layer superlattices (SLS) on GaAs substrates in p-i-n structures. The $In_yGa_{1-y}As$ crystal structure has a slightly larger lattice constant than that of pure GaAs, but the layers are thin enough so that the $In_yGa_{1-y}As$ undergoes a coherent strain to match the lattice of the rest of the crystal, hence the term strained layer. The p-i-n devices that they have fabricated have allowed them to determine the absorption characteristics of their superlattices and to estimate their overall quantum efficiencies. This is a critical first step for a photocathode device. For the best superlattice this efficiency is 10% for 1.06 μm light.

7228 (UCRL–53868-90, pp. 3.6-3.9) **High-efficiency semiconductor lasers with custom wavelengths.** Mariella, R.P. Jr. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

In FY 90 the author used his molecular beam epitaxy (MBE) machine under full computer control to grow twenty wafers with graded-index separate-confinement-heterostructure (GRINSCH) strained-layer $In_yGa_{1-y}As$ single-quantum-well diode-laser structures. He processed these wafers into broad area lasers and each wafer produced functioning lasers. He observed threshold current densities, J_{th}, as low as 179 A/cm^2 for 0.35-mm long devices. Only one publication in the literature has reported a lower J_{th} for 0.35-mm long lasers.

7229 (UCRL–53868-90, pp. 6.1-6.6) **Magnetic switch modeling.** Zentler, J.M. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors have developed a model that accurately simulates the behavior of magnetic switches. The model has been integrated into the NET-2 circuit analysis code to allow simulation of a wide variety of magnetic switching circuits. Specific versions of the model have been developed for 2605CO Metglas tape and TDK PE11B ferrite, two commonly used magnetic-core materials at the Laboratory. They have validated the switch model against experiment, and it is presently being applied in designing advanced accelerators in the Beam Research Program.

7230 (UCRL–53868-90, pp. 6.16-6.23) **Ultra-wideband microwave generation using GaAs photoconductive switches.** Hofer, W.W.; Druce, R.L.; Griffin, K.L.; Pocha, M.D. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors developed a 4-6-MW, laser-triggered, GaAs-switched ultra-wideband microwave generator that produced a broad output-power spectrum of 0.5 to 2.0 GHz. Their design is a parallel-plate, mismatched, 1 ns pulsewidth Blumlein generator switched in 150 ps and integrated with a wideband microwave antenna. When they stacked two mismatched Blumlein generators in series, they found that their microwave outputs added in both phase and amplitude, clearly demonstrating the precise timing and low jitter achieved with laser-triggered photoconductive switching. Stacked arrays of Blumlein generators may be capable of producing output power in the multigigawatt range. Their experimental results agreed well with models of circuits and three-dimensional electromagnetic fields of the microwave generator.

7231 (UCRL–53868-90, pp. 6.7-6.15) **High-power microwave generation using a backward-wave oscillator.** Camacho, J.F.; Rosenbury, E.T.; Poole, B.R. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors are investigating the high-power microwave (HPM) generation capability of a backward-wave oscillator (BWO) driven by an intense relativistic electron beam. In FY 90, they began an experimental and modeling effort with two objectives: to establish a BWO research program at LLNL by conducting an experiment based on a Soviet-like BWO design and to develop a source capable of efficiently generating a high-energy pulse ($\sim$ kJ) in the cm-wave regime. Their ultimate goal is to identify and study the mechanisms that prematurely terminate the microwave emission from BWOs operating at high power ($\sim$ 1 GW). They have made substantial progress in developing their BWO modeling capabilities, and have conducted linear theory analysis and nonlinear physics studies of BWO operation. Their experimental results show that their device operated at predominantly a single frequency, as expected, near the predicted operating point. Still, their BWO did not operate as efficiently as anticipated. In the future, they plan to continue their efforts to identify those effects that may be limiting BWO performance, to optimize that performance through hardware changes, and to develop more advanced diagnostics to study both the microwave emission and beam behavior.

7232 (UCRL-CR–108460) **Generation of high-quality petawatt pulses: Final report.** Mourou, G. (Michigan Univ., Ann Arbor, MI (United States)); Bado, Philippe. Lawrence Livermore National Lab., CA (United States); Michigan Univ., Ann Arbor, MI (United States). [1991]. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003965. Source: OSTI; NTIS; GPO Dep.

CPA sources need a front-end capable of generating very short seed pulses. To meet this requirement, present CPA sources rely on actively modelocked solid-state oscillators used in conjunction with non-linear fiber stages. This approach generates pulses with a residual frequency chirp, resulting in a limited peak-to-background intensity contrast ratio. The availability of an oscillator capable of producing directly (i.e. without fiber stage) picosecond or subpicosecond pulses would significantly improve the quality of CPA sources. We have pursued different approaches to replace the standard modelocked oscillator front-end. In an initial phase, we investigated the possible use of Additive Pulse Modelocking (APM) color-center lasers as oscillators for CPA Nd:glass sources. Lately we have developed a Ti:Sapphire modelocked oscillator operating in the one-micron range. In order to generate pulses with very high peak to background contrast ratio, we have built a non-linear coupled-cavity oscillator generating 200-fs pulses. This color-center laser operates in the 1.5–1.6 micron range. A diagram of the oscillator is shown in Fig. 1. The laser is pumped with a modelocked Nd:YAG source. Both KCl and NaCl crystals were tested as gain media. NaCl was found to have a larger tuning range and to generate a higher average power (up to 150 mW). When synchronously mode-locked, the color-center generates pulses in the 10–20 ps range. Once interferometrically coupled to non-linear external-cavity, this oscillator produces very short pulses (85 to 260 fs). This oscillator was first operated with a 2 mm birefringent plate. 85 fs, near transform-limited pulses were generated at 1.54 micron. As the laser was tuned to longer wavelength, the pulse duration increased, as well as the bandwidth-duration product. With a 4 mm birefringent plate, 125 fs, transform-limited pulses were generated over the full tuning range.

7233 (UCRL-JC–107363) **Materials for diode pumped solid state lasers.** Chase, L.L.; Davis, L.E.; Krupke, W.F.; Payne, S.A. Lawrence Livermore National Lab., CA (United States). 14 Jul 1991. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-910717–1: 2. international laser conference: material engineering, medicine, biology, physics and chemistry, Grenoble (France), 9-11 Jul 1991). Order Number DE92003973. Source: OSTI; NTIS; GPO Dep.

The advantages of semiconductor diode lasers and laser arrays as pump sources for solid state lasers are reviewed. The properties desired for solid state laser media for various diode pumping applications are discussed, and the characteristics of several promising media are summarized. 13 refs., 4 tabs.

7234 (UCRL-JC–107982) **Soft x-ray laser source development and applications: Worldwide progress.** Keane, C.J. Lawrence Livermore National Lab., CA (United States). Oct 1991. 50p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9107115–62: Society of Photo-Optical Instrumentation Engineers (SPIE) meeting, San Diego, CA (United States), 21-26 Jul 1991). Order Number DE92005248. Source: OSTI; NTIS; INIS; GPO Dep.

The field of soft x-ray laser research is at a point between the first demonstrations of x-ray amplification and the onset and widespread application of modest-sized x-ray lasers. The past several years have seen great strides in x-ray amplifier performance as well as the demonstration of proof-of-principle x-ray laser applications. In the near term, the challenge for the x-ray laser community will be to develop compact x-ray lasers and to carry out an applications experiment of crucial importance to an identifiable community of interested users. Achieving these goals will require furthering our understanding of basic amplifier physics and increasing our technological capabilities with x-ray lasers. In this paper, we summarize the results obtained to date in these areas, with emphasis on the most recent developments. 146 refs., 11 figs.

7235 (UCRL-JC-108670) **Soft x-ray projection lithography system design and cost analysis.** Ceglio, N.M.; Hawryluk, A.M. Lawrence Livermore National Lab., CA (United States). Jul 1991. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9107115-60: Society of Photo-Optical Instrumentation Engineers (SPIE) meeting, San Diego, CA (United States), 21-26 Jul 1991). Order Number DE92004661. Source: OSTI; NTIS; GPO Dep.

A baseline model providing technical performance specifications and preliminary cost assessments for a prototype Soft X-ray Projection Lithography (SXPL) system is presented. We find that the technical performance requirements for components of the SXPL system are beyond the current state of the technology. We have also conducted a wafer cost analysis for the proposed SXPL system. In our parametric analysis of normalized wafer exposure costs we find that variations in direct cost items (e.g., resist, mask optics, laser) have a small effect on wafer costs. More important are variations in variations in the performance of technical parameters which affect wafer throughput. Of these, mirror reflectivity is by far the most important, followed by optical design (which can reduce the number of mirrors), then parameters related to x-ray generation and collection, and finally resist sensitivity. The lifetime of multilayer coatings is not by itself a critical parameter in determining wafer exposure costs. However, the repairability of such coatings can be important. Indeed, if mirror replacement is required when coatings degrade (i.e., nonrepairable), then mirror lifetime becomes about as important as resist sensitivity in determining wafer exposure costs.

4270 Nuclear Explosions

7236 (LA-12189-MS) **Some new ideas for nuclear explosive spacecraft propulsion.** Solem, J.C. Los Alamos National Lab., NM (United States). Oct 1991. 17p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. Order Number DE92003009. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Because of the deleterious effects of galactic cosmic radiation, solar flares, zero gravity, and psychological stress, there is a strong motivation to develop high-specific-impulse and high-thrust spacecraft for rapid transport of astronauts between the planets. I present a novel spacecraft design using a large lightweight sail (spinnaker) driven by the pressure pulses from a series of nuclear explosions. The spacecraft appears to be a singularly competent and economical vehicle for high-speed interplanetary travel. Remarkably, the mass of the spinnaker is theoretically independent of the size of its canopy or the number or length of its tethers. Consequently, the canopy can be made very large to minimize radiation damage from the nuclear explosions and the tethers can be made very long to mitigate radiation hazard to the crew. I calculate the specific impulse of the nuclear explosive propellant as a function of the mass and yield of the explosives and the thrust as a function of yield and repetition rate. I show that the weight of the sail can be greatly reduced by tethering the canopy in many places on its surface and that the canopy mass is directly proportional to the bomb yield and inversely proportional to the number of tethers. The pressure from the nuclear explosion imparts a large impulsive acceleration to the lightweight spinnaker, which must be translated to a small smooth acceleration of the space capsule by using either the elasticity of the tethers or a servo winch in the space capsule or a combination of the two. Finally, I derive the optimum canopy shape and show that it will generally intercept about 2π of the solid angle from the detonation point. Should the political questions connected with this unconventional use of nuclear explosives be favorably resolved, the invention will be a good candidate for propulsion in the Mars mission.

43 PARTICLE ACCELERATORS

7237 (BNL-46849) **An organizational survey of the Stanford Linear Accelerator Center.** Shurberg, D.A.; Haber, S.B. Brookhaven National Lab., Upton, NY (United States). Nov 1991. 49p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE92005446. Source: OSTI; NTIS; GPO Dep.

At the request of the Department of Energy, an Organizational Survey (OS) was administered at the Stanford Accelerator Center (SLAC). The OS measured employees' opinions on subjects such as organizational culture, communication, commitment, group cohesion, coordination, safety, environmental issues, and job satisfaction. The result of this work was a quantitative measure of the notion of culture at the SLAC site. This report presents these results and discusses their interpretation.

7238 (INS-T-502) **Third collection of technical reports, 1991.** Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Mar 1991. 44p. (In Japanese). Order Number DE92751078. Source: OSTI; NTIS (US Sales Only); INIS.

On February 7, 1991, the third technological report meeting by the engineers in the Institute for Nuclear Study, University of Tokyo, was held as a part of the study and training curriculum in the Institute for Nuclear Study. In the report meeting, three general reports and three reports of official overseas trips were carried out, and these are summarized in this book. It shows the activities of INS engineers in wide fields and the standpoint of engineers in a university research institute clearly. In addition, it seems effective for the interchange in the institute and the technological advance. Though the every day activities of the engineers are diverse, the general reports were only three, and it is a little regrettable. In April, 1990, a step was taken for establishing the system for engineers also in University of Tokyo, and for accelerating this move further to 'special administration post', the technological report meeting and the collection of reports like these have important significance. Three general reports are on NC milling machine, high frequency acceleration in TARN2, and making of CAMAC branch driver for multi-functional terminals in INS. (K.I.).

7241 (INS-892) **Development of an SCRFQ heavy-ion linac for RI beams.** Arai, S.; Imanishi, A.; Morimoto, T.; Tojyo, E.;

Tokuda, N.; Shibuya, S. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Sep 1991. 15p. Order Number DE92751047. Source: OSTI; NTIS (US Sales Only); INIS.

A split coaxial RFQ (SCRFQ) is being developed to accelerate RI beams from 1 to 170 keV/u in the Japanese Hadron Project (JHP). Our SCRFQ is equipped with modulated vanes. On the basis of the studies on a cold model and a proton accelerating one, a 25.5-MHz prototype for the JHP SCRFQ has been constructed. The prototype consisting of three module-cavities is 2.1 m in length and 0.9 m in inner diameter, and accelerates ions with a charge-to-mass ratio (q/A) greater than 1/30 from 1 to 45.4 keV/u. The measured unloaded Q-value of the cavity is 6400 corresponding to about 84% of a calculated value, and the field imbalance between vanes is within ±0.6%. The designed intervane voltage of 109 kV for ions with q/A = 1/30 is achieved with a 70 kW peak power. By using ions of three species N_2^+, N^+ and Ne^+, acceleration tests are conducted. The transmission efficiency attained with a N^+ beam is better than 80% at normalized intervane voltages higher than 1.2. (author).

7242 (KEK–90-25(v.1), pp. 5-13) **ISIS status report.** Finney, J.L. (Rutherford Appleton Lab., Chilton (United Kingdom)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Two years back, I reported at ICANS X that ISIS was running regularly at 100 μA, 750 MeV, with 9 scheduled neutron instruments and one muon beam line. Overall efficiency, measured as a percentage of time beam on target, was about 72%, and our stated priority was to improve reliability at 100 μA current. Over the past two years, major improvements have been made to several component parts of the system, and reliability so far in 1990 is just below 80%. Regular running periods at 100 μA have been achieved, with 100 μA average current achieved over a period of over a week. On 3 November 1989 a record integrated current over 24 hours of 2571 μA hrs was obtained. Trip rates have been significantly reduced. Three more neutron instruments are now scheduled, bringing the total to 12 neutron and 1 muon instruments. Around 350 neutron experiments were run in the 7 cycles of 1989, and about the same number are expected to be run in the 6 cycles of 1990. (author).

After a lengthy period of 'digging-work' which started on 8-8-88 to build the 11 m deep proton transport tunnel, most of the concrete work is now complete and the steel structure for the target and neutron guide halls has been erected. Design work on the target- and supplies system is progressing well and a basis for the safety analysis report has been established. Besides investigations towards protection against air-plane crash and earthquake this also includes research to determine the retention factor of lead-bismuth for polonium and mercury. Studies on the lead bismuth thermal hydraulics and on the D_2-cold moderator system have so far confirmed our expectations and are still in progress. Also in progress is an irradiation endurance test on the target window material at Los Alamos. In addition to intensive development work on the liquid metal target, research on a lead pebble bed target has been initiated. (author).

This paper will describe the general idea of the JHP facility, primarily from the accelerator's point of view, and up-to-data results of the research and development on accelerator components. Among others, the R and D on the proton linac has been pursued at the KEK Laboratory since 1987, efforts having been devoted mainly to the development of prototype rf power sources, the rf structure development for the coupled-cell linac and the realization of a 10-MeV linac. The R and D study on the heavy-ion linac has been made at Institute for Nuclear Study, University of Tokyo, primarily on the split-coaxial RFQ linac. (author).

7249 (KEK-90-25(v.1), pp. 179-189) **Design of the compressor/stretcher ring of the Japanese Hadron Project.** Ohmori, C. (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study); Noda, A.; Kimiya, Y.; Kihara, M.; Yamane, I. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243-: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

A possibility of adopting a racetrack-type design for the compressor/stretcher ring of the Japanese Hadron Project is described. This design has two long straight sections to enable to inject the H$^-$ beam and to produce a high β point for the slow extraction. (author).

7250 (KEK-90-25(v.1), pp. 199-209) **On the way to high-power linear proton accelerator for the long half-life radionuclides transmutation.** Batskikh, G.I. (AN SSSR, Moscow (USSR). Radiotekhnicheskij Inst.); Lupandin, O.S.; Murin, B.P.; Fedotov, A.P. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243-: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

The concept of continuous mode high-power linear proton accelerator with 1.5 GeV energy, 0.3 A current for the long half-life nuclides transmutation into the short ones (waste of atomic power plants (APP)) is proposed. The accelerator design main principles, scheme and parameters are presented. The accent is made on the accelerator efficiency, reliability and radiation purity. (author).

7251 (KEK-90-25(v.1), pp. 134-139) **General aspects of the ISIS upgrade.** Broome, T.A. (Rutherford Appleton Lab., Chilton (United Kingdom)); Gardner, I.S.K.; Rees, G.H. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243-: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

The planned ISIS upgrade program for the accelerator and target station is described. This program aims at the increase of the synchrotron energy from 750 MeV to 800 MeV, and the increase of the intensity from 100 μA towards 200 μA, and also continuing the improvement of the reliability of the facility. In addition, some longer term development is mentioned. As the upgrade program for the accelerator and target station was detailed before, in this conference, only brief outline of the work is given. The main effort in the last two years has been directed at improving the accelerator reliability and reducing the frequency of beam trips which seem to shorten the life time of a uranium target. The failure of targets is discussed. The required and achieved performance figures of the accelerator are shown. The KFK/RAL improvement program is outlined. It was started in 1990, and all the hardwares are expected to be installed by April, 1993. Other development areas are reported. In the target station development, the targets with better resistance to thermal cycling damage will be developed. The design of a second target station for ISIS is considered. (K.I.).

7252 (KEK-90-25(v.1), pp. 279-287) **The accelerator complex of the Moscow Kaon Factory.** Chursin, A.G. (AN SSSR, Moscow (USSR). Inst. Yadernykh Issledovanij); Dubinsky, G.A.; Esin, S.K. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243-: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

The tuning of the linear accelerator in the present Moscow Meson Factory is about to be completed, and the first 600 MeV protons are going to be obtained this year. In accordance with the resolution on high energy physics of the USSR government, the project of Moscow Kaon Factory (MKF) has been designed since 1987. Four institutes collaborate and contribute to the development of the Kaon Factory project, and the proposal of the Moscow Kaon Factory was finished. In the proposal, the linear accelerator in the Moscow Meson Factory is to be used as the injector for the booster which is the first step of the MKF accelerator complex. After charge exchange injection, the H$^+$ beam is accelerated in the booster from 0.6 GeV to 7.5 GeV, and in the main ring, from 7.5 GeV to 45 GeV. At the end of acceleration, the 45 GeV beam is transferred from the main ring to the extender, then extracted slowly with 100% duty cycle. The time-energy structure of the accelerator complex, injection from the linear accelerator, the requirement for the lattice design, booster lattice, extender and synchrotron lattice, slow extraction, RF cavities and beam stability are described. (K.I.).

7253 (LA-UR-91-3436) **Proceedings of the PILAC optics workshop.** Los Alamos National Lab., NM (United States). Nov 1991. 650p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-9108183-: PILAC optics workshop, Los Alamos, NM (United States), 12-13 Aug 1991). Order Number DE92004653. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains viewgraphs on the following topics: PILAC Overview; PILAC Injection Line; PILAC General-Purpose Line Design; Program RAYTRACE; Design & Performance of MRS; Program MOTER; Recent Upgrades of MOTER; Use of MOTER at Michigan State; Spectrometer Design at Michigan State; Use of MOTER at CEBAF & Related Topics; TOSCA Calculations at CEBAF; TOSCA Calculations for PILAC; Measurements of EPICS Quadrupoles; Quadrupole Measurements and Analysis at Bates Laboratory; Analysis of 3D Quadrupole Data; Quadrupole 3D Fringe Fields (Theoretical Lecture); Analysis of 3D Field Data; Analysis of Dipole Fringe Fields; Quadrupoles with Perfect N=2 Symmetry; CEBAF Superconducting Cos (20) Quadrupole; Upgrades to TRANSPORT and TURTLE; Optics using Differential Algebra; and A Possible Test of Quad Optics Using EPICS.

7254 (SLAC-PUB-5709) **The tau-charm factory: Concept and construction.** Perl, M.L.; Niemi, G.D. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Dec 1991. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-911106-32: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004773. Source: OSTI; NTIS; INIS; GPO Dep.

The first part of this paper explains the tau-charm factory concept: a high luminosity, low-energy, two-ring, electron-positron collider which enables precise and probing studies of the physics of the charm quark, tau lepton, and tau neutrino. The second part describes the plans for construction of a tau-charm factory in Spain. 28 refs., 2 figs., 1 tab.

7255 (UM-P-91/37) **The access control and radiation monitoring system for the Austin Hospital PET Centre.** Egan, G.F. (Austin Hospital, Heidelberg (Australia)). Melbourne Univ., Parkville (Australia). School of Physics. [1991]. 9p. Order Number DE92613725. Source: OSTI; NTIS (US Sales Only); INIS.

A Positron Emission Tomography Centre is being established at the Austin Hospital, Melbourne. The cyclotron vault and hotcell laboratories have been categorized according to the National Council on Radiation Protection and Measurements guidelines for access control to radiation areas. An access control system incorporating visual alarm systems, signs, barriers and interlocks has been designed for the safe operation of the Centre. These features are briefly described. 6 refs., 1 fig.

7256 (BNL-46668) **Beam tracking of SXLS with realistic magnetic field.** Huang, Yun-Xiang. Brookhaven National Lab., Upton, NY (United States). Sep 1991. 31p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE92004994. Source: OSTI; NTIS; INIS; GPO Dep.

In early 1977, while working for NSLS at Brookhaven National Lab., Dr. Ohnuma noticed that tunes of NSLS calculated with code SYNCH were significantly different from those obtained with code PATRICIA. This problem surfaced again in 1991 when people at BNL discovered discrepancies in their compact ring SXLS chromaticities calculated with different code. One potential source of the ambiguities is the different treatment of the edge field and the combined function field of dipole magnet. There are two dipoles each of which with the bending angle of 180° instead of at most a few degrees which is common in high energy synchrotrons. The calculation of a three-dimensional field using TOSCA indicates that the fringe field extends to cover the whole region between the dipole and the quadrupole, having a vertical field strength of 250 gauss at the edge of the quadrupole. In this case, the fringe multiple field will undoubtedly play a nontrival role in determining basic machine parameters. Therefore, the classical treatment for simulating particle motion in synchrotron, which uses the isomagnetic approximation plus then lens kicks, no longer accurately models the closed orbit of the machine. In order to correctly calculate tunes, chromaticities as well as the dynamic aperture in such kind of machine with a large magnetic bending angle, it is necessary to integrate the exact equations of motion in a realistic representation of the magnetic field.

7257 (BNL--46751) **Exact analysis to any order of the linear coupling problem in the thin lens model.** Ruggiero, A.G. Brookhaven National Lab., Upton, NY (United States). [1991]. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-9110243--7: 5. International Committee for Future Accelerators (ICFA) beam dynamics workshop, Corpus Christi, TX (United States), 3-8 Oct 1991). Order Number DE92005005. Source: OSTI; NTIS; INIS; GPO Dep.

In this report we attempt the exact solution of the motion of a charged particle in a circular accelerator under the effects of skew quadrupole errors. We adopt the model of error distributions, lumped in locations with zero extensions. This thin-lens approximation provides an analytical insight to the problem to any order. The total solution is expressed in terms of driving terms which are actually correlation factors to several order. An application follows on the calculation and correction of tune-splitting and on the estimate of the role the higher-order terms play in the correction method.

7258 (BNL--46792) **Stochastic cooling with a double rf system.** Wei, J. Brookhaven National Lab., Upton, NY (United States). Oct 1991. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (AD/RHIC--105). Order Number DE92004995. Source: OSTI; NTIS; INIS; GPO Dep.

Stochastic cooling for a bunched beam of hadrons stored in an accelerator with a double rf system of two different frequencies has been investigated. The double rf system broadens the spread in synchrotron-oscillation frequency of the particles when they mostly oscillate near the center of the rf bucket. Compared with the case of a single rf system, the cooling rate is significantly increased. When the rf voltage is raised, the reduction rate of the emittance, instead of decreasing linearly, now is independent of the ratio of the bunch area to the bucket area. With the double rf system, the spread in synchrotron-oscillation frequency is small for particles with synchrotron-oscillation amplitudes comparable to the dimension of the rf bucket. Consequently, stochastic cooling becomes less effective when the bunch area is close to the bucket area.

7259 (BNL--46840) **Electron beam optics for the FEL experiment and IFEL experiment.** van Steenbergen, A. Brookhaven National Lab., Upton, NY (United States). [1990]. 30p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE92005049. Source: OSTI; NTIS; INIS; GPO Dep.

Electron beam transport system parameters for the FEL experiment and for the FEL experiment are given. The perturbation of the "interaction region" optics due to wiggler focussing is taken into account and a range of solutions are provided for relevant Twiss parameters in the FEL or IFEL region. Modifications of the transport optics in specific sections of the overall beam transport lines, for reasons of enhanced diagnostic capability or enhanced beam momentum analysis resolution, is also presented.

7260 (ENEA-RT-INN--90-32) **Bi-unitary transformation and ordinary differential equations: Part 3.** Dattoli, G.; Loreto, V.; Mari, C.; Richetta, M.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Sep 1991. 20p. (RT/INN--90-32). Order Number DE92744018. Source: OSTI; NTIS (US Sales Only).

In two previous papers, the authors introduced the concept of binormal differential equations. It was shown that invariants of the Courant-Snyder type are associated with the scalar products of the column vectors associated to an ordinary differential equation and to its binormal. This paper shows the equivalence of the above invariant and the Lewis form. It also introduces a density matrix for a second-order differential equation and clarifies the geometrical meaning of Twiss parameters. Within the framework of accelerator physics, the importance of the above results in the analysis of quantum problems such as the evolution of squeezed states is stressed.

7261 (ENEA-RT-INN--90-49) **Wave theory of charged beam propagation.** Dattoli, G.; Gallerano, G.P.; Giannessi, L.; Richetta, M.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 24p. (RT/INN--90-49). Order Number DE92744016. Source: OSTI; NTIS (US Sales Only).

Using a recent quantum mechanical treatment of charged beam propagation in which the emittance plays the role of Planck's constant, this paper constructs a wave theory of the beam transport along guiding systems. It shows that the distribution of a beam passing through quadrupole lenses can be described in terms of gaussian beams; discusses the role of Twiss parameters within this context; and derives an ABCD law for charged beam transport.

7262 (ENEA-RT-INN--90-50) **Perturbative analysis of Kapchinskij-Vladimirskij problem in emittance dominated regime.** Dattoli, G.; Giubileo, C.; Mezi, L.; Richetta, M.; Ronsivalle, C.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 14p. (RT/INN--90-50). Order Number DE92744011. Source: OSTI; NTIS (US Sales Only).

Making reference to the Kapchinskij-Vladimirskij electron beam envelope evolution equation, this paper presents a first order perturbative analysis of the space-charge effect on a charged beam with cylindrical symmetry. Particular attention is given to the modification induced in the propagation through a drift space and a thin lens.

7263 (ENEA-RT-INN--90-54) **Formal quantum theory of electronic rays.** Dattoli, G.; Giannessi, L.; Mari, C.; Richetta, M.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 21p. (RT/INN--90-54). Order Number DE92744012. Source: OSTI; NTIS (US Sales Only).

A quantum theory of charged beam propagation in transport magnetic structures is developed. The time coordinate of quantum mechanics is replaced by the propagation coordinate and the beam emittance takes the place of Planck's constant. Coherent beam distributions are also discussed.

7264 (ENEA-RT-INN--90-60) **Coupled transverse motion in charged beam transport dynamics and generalized Twiss coefficients.** Dattoli, G.; Mari, C.; Ronsivalle, C.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Apr 1991. 14p. (RT/INN--90-60). Order Number DE92744006. Source: OSTI; NTIS (US Sales Only).

Within the framework of accelerator physics beam dynamics modelling, this paper discusses a generalized Courant-Snyder theory for n-dimensional quadratic Hamiltonians. It stresses the usefulness of the obtained results both for transverse mode coupling in accelerators and in quantum mechanics for the generation of squeezed states.

7265 (ENEA-RT-INN--90-68) **Twiss parameters and evolution of quantum harmonic oscillator states.** Dattoli, G.; Gallerano, G.P.; Mari, C.; Torre, A.; Richetta, M. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 22p. (RT/INN--90-68). Order Number DE92744013. Source: OSTI; NTIS (US Sales Only).

This paper shows that the evolution of a quantum state, driven by a harmonic oscillator type Hamiltonian, can be studied by using tools exploited to characterize the evolution of a charged beam in a transport channel. Within the framework of accelerator physics, the relevance of the Courant-Snyder invariant and of Twiss-like parameters to characterize, e.g., the amount of squeezing, is carefully pointed out.

7266 (ENEA-RT-INN–90-70) **Ordinary differential equation with non constant coefficients theory: Miscellaneous results.** Dattoli, G.; Giannessi, L.; Mari, C.; Richetta, M.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 26p. Order Number DE92744017. Source: OSTI; NTIS (US Sales Only).

Within the framework of accelerator physics beam dynamics problems, this paper applies the Courant-Snyder theory to second-order ordinary differential equations with non-constant complex coefficients. The same theory is exploited in the case of third-order equations with non-constant real coefficients. The usefulness of the Magnus expansion to get approximate solutions is finally discussed.

7267 (ENEA-RT-INN–90-72) **XUV FELs by harmonics amplification: Parametric analysis in two-undulator schemes.** Dipace, A.; Sabia, E. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 16p. (RT/INN–90-72). Order Number DE92744015. Source: OSTI; NTIS (US Sales Only).

A two-undulator FEL (free electron laser) amplifier for the production of XUV (extreme ultraviolet) radiation by harmonics generation is analyzed in the framework of the exponential gain regime. Some criteria to design the composite undulator are then described.

7268 (FNAL/C–91/300) **Longitudinal beam dynamics at transition crossing.** Bogacz, S.A. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-9110243–6: 5. International Committee for Future Accelerators (ICFA) beam dynamics workshop, Corpus Christi, TX (United States), 3-8 Oct 1991). Order Number DE92004122. Source: OSTI; NTIS; INIS; GPO Dep.

A brief outline of the longitudinal single particle dynamics at transition is presented in terms of phase-space mappings. Simple quantitative prediction about the phase-space dilution is made. More realistic simulation (ESME) of the transition crossing is carried out (including various collective and single particle effects contributing to the longitudinal emittance blow up). The simulation takes into account the longitudinal space-charge force (bunch length oscillation), the transverse space-charge (the Umstaetter effect) and finally the dispersion of the momentum compaction factor (the Johnsen effect). As a result of this simulation one can separate relative strengths of the above mechanisms and study their individual effects on the longitudinal phase-space evolution, especially filamentation of the bunch and formation of a "galaxy-like" pattern. 7 refs., 2 figs.

In *Fourth advanced ICFA beam dynamics workshop on collective effects in short bunches.* 202p. Order Number DE92713858. Source: OSTI; NTIS (US Sales Only); INIS.

Short-range wake functions are usually obtained using time-domain computer programs. We demonstrate that frequency domain methods can also be usefully applied to this end. In addition, we show that the speed and ease of the required computations can be greatly improved if the calculations are performed at complex, rather than at real, frequencies. (author).

7275 (KEK–90-21, pp. 151-160) **Shielded coherent synchrotron radiation and its effect on very short bunches.** Warnock, R.L. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1991. (CONF-9009292–: 4. advanced ICFA beam dynamics workshop on collective effects in short bunches, Tokyo (Japan), 22-29 Sep 1990). In *Fourth advanced ICFA beam dynamics workshop on collective effects in short bunches.* 202p. Order Number DE92713858. Source: OSTI; NTIS (US Sales Only); INIS.

Shielded coherent synchrotron radiation is discussed for two cases: (1) a beam following a circular path midway between two parallel conducting plates, and (2) a beam circulating in a toroidal chamber. Wake fields and the energy radiated are computed for both cases. Under conditions like those of the high-energy bunch compressor of the Next Linear Collider (NLC), in which bunches as short as 40 microns are contemplated, the shielded coherent radiated power is estimated to be small compared to the incoherent power, but can still amount to a few hundred KeV over the compressor arc. (author).

7276 (KEK–90-21, pp. 161-170) **Impedance scaling and synchrotron radiation intercept.** Chou, W. (Superconducting Super Collider Lab., Dallas, TX (United States)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1991. (CONF-9009292–: 4. advanced ICFA beam dynamics workshop on collective effects in short bunches, Tokyo (Japan), 22-29 Sep 1990). In *Fourth advanced ICFA beam dynamics workshop on collective effects in short bunches.* 202p. Order Number DE92713858. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents several scalings in 2-D and 3-D impedance calculations. Most of the scalings are empirical and are found by using the boundary perturbation method and numerical simulations. As an application of these scalings, it is calculated, the impedance of one type of the synchrotron radiation intercept. The results are then compared with that of several other types of intercept designs. (author).

7277 (KEK–90-21, pp. 171-180) **Coherent synchrotron radiation.** Nakazato, T. (Tohoku Univ., Sendai (Japan). Lab. of Nuclear Science). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1991. (CONF-9009292–: 4. advanced ICFA beam dynamics workshop on collective effects in short bunches, Tokyo (Japan), 22-29 Sep 1990). In *Fourth advanced ICFA beam dynamics workshop on collective effects in short bunches.* 202p. Order Number DE92713858. Source: OSTI; NTIS (US Sales Only); INIS.

The complete spectrum of coherent synchrotron radiation were measured at wavelengths from 0.16 to 3.5 mm. A bunch shape was estimated by the Fourier analysis for this spectrum. This result agrees with that of simulation for the bunching process in the injector of the accelerator. The interferential effects between radiation which were emitted by the different bunches were observed by an interferometer. It was shown that every radiation had the same phase when it was emitted by a bunch. (author).

This paper is concerned with the synchrotron radiation from an undulating electron beam in a rectangular waveguide. The analysis is based on the dyadic Green's function approach to solve Maxwell's equations in terms of the vector potential. It is shown analytically and numerically that the radiated energy spectrum may differ significantly from the free space result when the undulator length divided by the Lorentz factor of the electron beam is larger than the transverse size of the waveguide. Then, the appearance of the spectrum is changed into a small number of sharp peaks, each corresponding to an excited waveguide mode. The undulator radiation is identified with the wake field in beam instabilities. The concepts of wake function and impedance are introduced to formulate the present problem in the same manner as the beam instability problem, so that the accumulated techniques of the latter can be applied. It is shown that the obtained impedances satisfy the Panofsky-Wenzel theorem and other properties inevitable for wake fields. (author).

7280 (KEK–90-21, pp. 109-115) **Suppression of single bunch beam breakup by BNS damping.** Gluckstern, R.L. (Maryland Univ., College Park, MD (United States). Dept. of Physics); Neri, F.; Van Zeijts, J.B.J. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1991. (CONF-9009292–: 4. advanced ICFA beam dynamics workshop on collective effects in short bunches, Tokyo (Japan), 22-29 Sep 1990). In *Fourth advanced ICFA beam dynamics workshop on collective effects in short bunches.* 202p. Order Number DE92713858. Source: OSTI; NTIS (US Sales Only); INIS.

The intense narrow beams now used or planned in linear colliders lead to strong wake fields which are capable of increasing the transverse emittance to unacceptable values. A brief analysis of this phenomenon, known as single bunch beam breakup, was outlined for a coasting beam, using the cumulative beam breakup formalism. It was suggested that by decreasing the energy of the tail of a bunch relative to its head, the resulting increased focusing force on the tail of the bunch could offset the effect of single bunch beam breakup. This method is a form of Landau damping now known as BNS damping. A variant of BNS damping in which all particles in a bunch oscillate with the same transverse frequency, amplitude and phase was suggested recently. In this study, the single bunch beam breakup with BNS damping for a uniform coasting beam was analyzed in order to explore the dependence on parameters. An earlier formulation for cumulative beam breakup was used, and finally the transverse beam growth was expressed in terms of two universal parameters. The analysis of single bunch beam breakup and BNS damping is reported. (K.I.).

7281 (KFTI–89-54) **Nonlinear theory of the relativistic electron flow instability in laminated plasma based on the Smith-Purcell effect.** Balakirev, V.A.; Tkach, Yu.V.; Tolstoluzhskij, A.R. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1989. 19p. (In Russian). Order Number DE92610955. Source: OSTI; NTIS (US Sales Only); INIS.

Linear and non-linear theory of short-wave electromagnetic radiation excitation by an electron beam moving along plasma diffraction lattice is constructed. A case is considered when an electromagnetic wave is emitted at an angle to the beam. It is shown that depending on the beam and plasma parameters both vacuum and plasma radiation excitation regimes can be realized. In the first case instability is linked with charge density show wave energy losses for radiation. The plasma regime is characterized by the fact that the effective dielectric permittivity of the system is negative. In this case beam modulation occurs under effect of the fields induced in plasma. Clusters produced in such a way, emit an electromagnetic wave by crossing the lattice. 9 refs.; 12 figs.

7282 (LBL–30674) **Achromatic and isochronous electron beam transport for tunable free electron lasers.** Bengtsson, J.; Kim, K.J. Lawrence Berkeley Lab., CA (United States). Sep 1991. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (ESG–133;CONF-9108118–34: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE92003908. Source: OSTI; NTIS; INIS; GPO Dep.

We have continued the study of a suitable electron beam transport line, which is both isochronous and achromatic, for the free electron laser being designed at Lawrence Berkeley Laboratory. A refined version of the beam transport optics is discussed that accommodates two different modes of FEL wavelength tuning. For the fine tuning involving a small change of the electron beam energy, sextupoles are added to cancel the leading nonlinear dispersion. For the main tuning involving the change of the undulator gap, a practical solution of maintaining the beam matching condition is presented. Calculation of the higher order aberrations is facilitated by a newly developed code. 11 refs., 4 figs., 3 tabs.

7283 (LBL–31242) **Polarized nature of synchrotron radiation.** Kim, K.J. Lawrence Berkeley Lab., CA (United States). Sep 1991. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-9107127–1: Conference on scanning microscopy instrumentation, San Diego, CA (United States), 21-26 Jul 1991). Order Number DE92003903. Source: OSTI; NTIS; INIS; GPO Dep.

Synchrotron radiation is inherently highly polarized, and this fact makes synchrotron radiation useful for probing the directional and/or helical nature of the matter via polarization sensitive experiment. Here we summarize briefly the nature of the polarization experiments and the polarization characteristics of synchrotron radiation. 12 refs., 3 figs.

7284 (SAND-91-2587C) **Phase mixing of transverse oscillations in the linear and nonlinear regimes for IFR relativistic electron beam propagation.** Shokair, I.R. Sandia National Labs., Albuquerque, NM (United States). [1991]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9106276-4: Charged particle beam conference, Silver Springs, MD (United States), 25-27 Jun 1991). Order Number DE92003956. Source: OSTI; NTIS; INIS; GPO Dep.

Phase mixing of transverse oscillations changes the nature of the ion hose instability from an absolute to a convective instability. The stronger the phase mixing, the faster an electron beam reaches equilibrium with the guiding ion channel. This is important for long distance propagation of relativistic electron beams where it is desired that transverse oscillations phase mix within a few betatron wavelengths of injection and subsequently an equilibrium is reached with no further beam emittance growth. In the linear regime phase mixing is well understood and results in asymptotic decay of transverse oscillations as $1/Z^2$ for a Gaussian beam and channel system, Z being the axial distance measured in betatron wavelengths. In the nonlinear regime (which is likely mode of propagation for long pulse beams) results of the spread mass model indicate that phase mixing is considerably weaker than in the regime. In this paper we consider this problem of phase mixing in the nonlinear regime. Results of the spread mass model will be shown along with a simple analysis of phase mixing for multiple oscillator models. Particle simulations also indicate that phase mixing is weaker in nonlinear regime than in the linear regime. These results will also be shown. 3 refs., 4 figs.

7285 (SLAC-PUB-5294) **Observation and analysis of oscillations in linear accelerators.** Seeman, J.T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Nov 1991. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890786-4: US particle accelerator school, Upton, NY (United States), 24 Jul - 4 aug 1989). Order Number DE92004715. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following on oscillation in linear accelerators: Betatron Oscillations; Betatron Oscillations at High Currents; Transverse Profile Oscillations; Transverse Profile Oscillations at High Currents.; Oscillation and Profile Transient Jitter; and Feedback on Transverse Oscillations.

7286 (SLAC-PUB-5695) **Review of lattice measurement techniques at the SLC.** Barklow, T.; Emma, P.; Krejcik, P.; Walker, N. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Nov 1991. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-9110243-5: 5. International Committee for Future Accelerators (ICFA) beam dynamics workshop, Corpus Christi, TX (United States), 3-8 Oct 1991). Order Number DE92004712. Source: OSTI; NTIS; INIS; GPO Dep.

A technique is described for reconstructing the first order transport matrix (R) for a given beam line. Emphasis is placed on the rigorous error analysis of the data, and the use of powerful statistical techniques to estimate unknown systematic errors. The application of the technique to the measurement and subsequent correction of the SLC Arcs is briefly described. 5 refs., 4 figs.

7287 (SLAC-PUB-5700) **GLAD: A Generic LAttice Debugger.** Lee, M.J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Nov 1991. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-911116-14: International conference on accelerator and large experimental physics control systems, Tsukuba (Japan), 11-15 Nov 1991). Order Number DE92004949. Source: OSTI; NTIS; INIS; GPO Dep.

Today, numerous simulation and analysis codes exist for the design, commission, and operation of accelerator beam lines. There is a need to develop a common user interface and database link to run these codes interactively. This paper will describe a proposed system, GLAD (Generic LAttice Debugger), to fulfill this need. Specifically, GLAD can be used to find errors in beam lines during commissioning, control beam parameters during operation, and design beam line optics and error correction systems for the next generation of linear accelerators and storage rings.

7288 (SLAC-PUB-5716) **Observation and cures of wakefield effects in the SLC Linac.** Seeman, J.T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Dec 1991. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-9110243-9: 5. International Committee for Future Accelerators (ICFA) beam dynamics workshop, Corpus Christi, TX (United States), 3-8 Oct 1991). Order Number DE92006432. Source: OSTI; NTIS; INIS; GPO Dep.

The acceleration and transport of beams with high currents and low emittances are very carefully controlled for the SLC Linac. Both longitudinal and transverse wakefields affect strongly the trajectory and emittance corrections used for operations during collisions. Longitudinal beam loading introduces an internal energy spread. This loading produces the expected doubled peaked energy spectra while reducing the overall available energy for acceleration. Transverse wakefields cause rapid oscillation amplitude growth with injection errors but can be ameliorated with transverse wakefield (BNS) damping. Transverse wakefields cause an apparent change in the lattice strength, affecting the interpretation of lattice diagnostics. Oscillations also produce non-gaussian transverse density distributions, which must be controlled for emittance and background reduction. Finally, the small misalignments of the accelerating structure enlarge the emittances of the beam. They can be controlled through off-axis trajectories and through systematic waveguide movements.

7289 (ANL/CP-72872) **A shutter design for time domain studies using synchrotron radiation at the advanced photon source.** Norris, J.R.; Bowman, M.K.; Chen, L.; Tang, J.; Thurnauer, M.C.; Knapp, G.S.; Montano, P.A. Argonne National Lab., IL (United States). Sep 1991. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-910730-24: 4. international conference on synchrotron radiation instrumentation, Chester (United Kingdom), 15-19 Jul 1991). Order Number DE92003405. Source: OSTI; NTIS; GPO Dep.

In general a variable repetition rate of the x-ray bunches is needed to explore time domain problems using x-ray radiation. In some instances the results of several hundreds or thousands of x-ray pulses must be averaged requiring the sample to be in the same time dependent state each time the monitoring pulse strikes. In the most advanced and most detailed version of this type experiment an intense laser pulse would be used to create an excited state from a relaxed ground state. An additional "probe-pulse" that follows the laser "pump-pulse" would examine the sample. The important point is that before a second x-ray pulse hits the sample, the system must return to its initial relaxed ground state prior to another laser pulse in order to prepare the same excited state again. Otherwise the second x-ray probes a different condition of the system than the previous x-ray bunch such that any data averaging scheme would be invalid. Our system is primarily designed for the Advanced Photon source (APS) at Argonne National Laboratory. In the 20-bunch mode of APS an x-ray pulse will occur every 177 nanoseconds, requiring each edge of a conventional two-blade "shutter" to travel at least 0.25 mm in ~177 nanoseconds. Our key design principle employs a subsonic, rotating mirror whose period is slaved to the synchrotron intra-pulse period. The synchrotron x-ray bunches will be reflected a distance of about two meters to a narrow 0.5 mm slit just in front of the sample. The time that the reflected synchrotron spends striking the slit is given by $1/(4\pi rf)$ where r is the radius from the center of the spindle to the slit, and f is the frequency of rotation of the spindle. A mirror rotating at a low 7,500 rpm (125 Hz) is sufficient to select a single synchrotron pulse. The very precise phase stability required by this method is currently available in rotating mirror devices for laser scanning. 11 refs., 2 figs.

7290 (ANL/CP–73788) **A high-current, high-voltage power supply with special output current waveform for APS injector synchrotron dipole magnets.** Fathizadeh, M.; Despe, O.D.; McGhee, D.G.; Mills, F.E.; Turner, L.R. Argonne National Lab., IL (United States). [1991]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-911106–41: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004132. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a high-voltage, high-current power supply for the injector synchrotron dipole magnets at APS. In order to reset the dipole magnets in each cycle two different current waveforms are suggested. The first current waveform consists of three sections, namely: dc-reset, linear ramp, and recovery sections where injection is done "on the fly". The second current waveform consists of six different sections, dc-reset, transition to injection level, injection flat level, parabolic, linear ramp and recovery sections. The effect of such waveforms on the beam is discussed and the power supply limitations to follow such waveforms are given. The power supply limitations are due to the power components and control loops. The reference for the current loop is generated by a DAC which is discussed.

7291 (ANL/CP–74078) **High heat load performance of an inclined crystal monochromator with liquid gallium cooling on the CHESS-ANL undulator.** Macrander, A.T.; Lee, W.K.; Smither, R.K.; Mills, D.M.; Rogers, S.; Khounsary, A. Argonne National Lab., IL (United States). Nov 1991. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9110146–4: 7. national conference and exhibition on synchrotron radiation instrumentation, Baton Rouge, LA (United States), 28-31 Oct 1991). Order Number DE92004131. Source: OSTI; NTIS; GPO Dep.

Results for the performance of a novel double crystal monochromator subjected to high heat loads from an APS prototype undulator at the Cornell High Energy Synchrotron Source (CHESS) are presented. The monochromator was designed to achieve symmetric diffraction from asymmetric planes to spread out the beam footprint thereby lowering the incident power density. Both crystals had (111) oriented surfaces and were arranged such that the beam was diffracted from the $(11\bar{1})$ planes at 5 KeV. Rocking curves with minimal distortion were obtained at a ring electron current of 96 mA. This corresponded to 370 Watts total power and an peak power density of 48 Watts/mm^2 normal to the incident beam. These results are compared to data obtained from the same crystals in the standard geometry (diffracting planes parallel to surface). The footprint area in the inclined case was three times that of the standard case. We also obtained rocking curve data for the {333} reflection at 15 KeV for both standard and inclined cases, and these data also showed a minimal distortion for the inclined case. In addition, thermal data were obtained via infrared pyrometry. Not only the diffraction data but also the thermal data revealed a dramatically improved performance for the inclined crystal case.

7292 (ANL/CP–74827) **Man-machine interface builders at the Advanced Photon Source.** Anderson, M.D. Argonne National Lab., IL (United States). [1991]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-911271–1: FedUNIX/Motif '91, Washington, DC (United States), 8-12 Dec 1991). Order Number DE92004716. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory is constructing a 7-GeV Advanced Photon Source for use as a synchrotron radiation source in basic and applied research. The controls and computing environment for this accelerator complex includes graphical operator interfaces to the machine based on Motif, X11, and PHIGS/PEX. Construction and operation of the control system for this accelerator relies upon interactive interface builder and diagram/editor type tools, as well as a run-time environment for the constructed displays which communicate with the physical machine via network connections. This paper discusses our experience with several commercial CUI builders, the inadequacies found in these, motivation for the development of an application- specific builder, and design and implementation strategies employed in the development of our own Man-Machine Interface builder. 5 refs.

7293 (ANL/CP–74843) **First operation of ATLAS using the PII linac and a comparison to tandem injection.** Pardo, R.C.; Bollinger, L.M.; Billquist, P.J.; Bogaty, J.M.; Clifft, B.E.; Markovich, P.; Munson, F.H.; Shepard, K.W.; Zinkann, G.P. Argonne National Lab., IL (United States). [1991]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9110258–4: Symposium of northeastern accelerator personnel, Albuquerque, NM (United States), 15-19 Oct 1991). Order Number DE92004724. Source: OSTI; NTIS; INIS; GPO Dep.

The ATLAS Positive Ion Injector (PII) is designed to replace the tandem injector for the ATLAS heavy-ion facility. When the PII project is complete, ATLAS will be able to accelerate all ions through uranium to energies above the Coulomb barrier. PII consists of an ECR ion source on a 350 kV platform and a very low-velocity superconducting linac. The PII project is nearing completion. First beam from the complete system is expected in early 1992. Beam tests and experiments using a partially completed PII linac have demonstrated that the technical design goals are being met. The results of the early beam tests and first experiments will be discussed and compared to the performance of ATLAS with tandem injection. 10 refs., 2 figs.

7294 (ANL/CP–74952) **Offset calibration of the beam position monitor using external means.** Chung, Y.; Decker, G. Argonne National Lab., IL (United States). [1991]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9110118–4: Accelerator instrumentation workshop, Newport News, VA (United States), 28-31 Oct 1991). Order Number DE92005232. Source: OSTI; NTIS; INIS; GPO Dep.

Determination of the offset of the electrical center of the beam position monitor (BPM) relative to the mechanical center is required for the absolute beam position measurement in the injector synchrotron and the storage ring of the APS. Conventionally, RF signal is sent to an antenna or through a wire carefully aligned in the vacuum chamber and the signal is measured at each electrode. A new method using only external means which does not involve mechanical alignment inside the vacuum chamber was applied to the injector synchrotron BPM unit in this work. The result shows a good agreement with the wire method within 15 μm error. A similar measurement on the storage ring BPM will also be discussed.

7295 (BNL–46121) **Object-oriented programming techniques for the AGS Booster.** Skelly, J.F. Brookhaven National Lab., Upton, NY (United States). [1991]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-911116–15: International conference on accelerator and large experimental physics control systems, Tsukuba (Japan), 11-15 Nov 1991). Order Number DE92005032. Source: OSTI; NTIS; INIS; GPO Dep.

The applications software developed for the control system of the AGS Booster Project was written in the object-oriented language, C++. A the start of the Booster Project, the programming staff of the AGS Controls Section comprised some dozen programmer/analysts, all highly fluent in C but novices in C++. During the coarse of this project, nearly the entire staff converted to using C++ for a large fraction of their assignments. Over 100 C++ software modules are now available for Booster and general AGS use, of which a large fraction are broadly applicable tools. The transition from C to C++ from a managerial perspective is discussed and an overview is provided of the ways in which object classes have been applied in Booster software development.

7296 (BNL–46165) **Photoemission using femtosecond laser pulses.** Srinivasan-Rao, T.; Tsang, T.; Fischer, J. Brookhaven National Lab., Upton, NY (United States). Oct 1991. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-9108118–35: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE92004997. Source: OSTI; NTIS; INIS; GPO Dep.

Successful operation of short wavelength FEL requires an electron bunch of current >100 A and normalized emittance < 1 mm-mrad. Recent experiments show that RF guns with photocathodes as the electron source may be the ideal candidate for achieving these parameters. To reduce the emittance growth due to space charge and RF dynamics effects, the gun may have to operate at high field gradient (hence at high RF frequency) and a spot size small compared to the aperture. This may necessitate the laser pulse duration to be in the subpicosecond regime to reduce the energy spread. We will present the behavior of metal photocathodes upon irradiation with femtosecond laser beams, comparison of linear and nonlinear photoemission, and scalability to high currents. Theoretical estimate of the intrinsic emittance at the photocathode in the presence of the anomalous heating of the electrons, and the tolerance on the surface roughness of the cathode material will be discussed.

7297 (BNL–46679) **Performance of the Brookhaven photocathode rf gun.** Batchelor, K. (Brookhaven National Lab., Upton, NY (United States)); Ben-Zvi, I.; Fernow, R.C.; Fischer, J.; Fisher, A.S.; Gallardo, J.; Ingold, G.; Kirk, H.G.; Leung, K.P.; Malone, R.; Pogorelsky, I.; Srinivasan-Rao, T.; Rogers, J.; Tsang, T.; Sheehan, J.Brookhaven National Lab., Upton, NY (United States). [1991]. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-9108118–38: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE92005008. Source: OSTI; NTIS; INIS; GPO Dep.

The Brookhaven Accelerator Test Facility (ATF) uses a photocathode rf gun to provide a high-brightness electron beam intended for FEL and laser-acceleration experiments. The rf gun consists of $1\frac{1}{2}$ cells driven at 2856 MHz in π-mode with a maximum cathode field of 100 MV/m. To achieve long lifetimes, the photocathode development concentrates on robust metals such as copper, yttrium and samarium. We illuminate these cathodes with a 10-ps, frequency-quadrupled Nd:YAG laser. We describe the initial operation of the gun, including measurements of transverse and longitudinal emittance, quantum efficiencies, and peak current. The results are compared to models.

7298 (BNL–46750) **What's new with FASTBUS and what's it done in the particle accelerator laboratories.** Costrell, L. (National Inst. of Standards and Technology, Gaithersburg, MD (United States)); Dawson, W.K.; Ponting, P.J.; Platner, E.D.; Paffrath, L.; Barsotti, E.J.; Downing, R.W. Brookhaven National Lab., Upton, NY (United States). [1991]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-911106–53: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92005002. Source: OSTI; NTIS; INIS; GPO Dep.

The FASTBUS modular high-speed data acquisition and control system has been described in earlier papers. Implementations have since been made in accelerator laboratories world-wide resulting in clarifications, modifications and extensions. Of tremendous benefit to users have been FASTBUS Standard Routines. The availability of such standard software is unique for high speed bus systems and resulted from the involvement of hardware and software specialists in all aspects of the development. FASTBUS is the highest performance instrumentation and data acquisition bus in existence and its development was essential to handle the outputs of detectors used with high energy accelerators now in operation. It has been an important factor in recent experiments, including the Z^0 measurements at CERN, Fermilab and SLAC. Also among numerous FASTBUS implementations are those for TPC systems at KEK and BNL. 2 refs., 5 figs.

7299 (BNL–46773) **Beam instrumentation in the AGS Booster.** Witkover, R.L. Brookhaven National Lab., Upton, NY (United States). [1991]. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-9110118–2: Accelerator instrumentation workshop, Newport News, VA (United States), 28-31 Oct 1991). Order Number DE92004999. Source: OSTI; NTIS; INIS; GPO Dep.

The AGS Booster was designed to accelerate low intensity (2×10^{10}) polarized protons, high intensity (1.5×10^{13}) protons and heavy ions through Au^{+33}. Coping with this wide range of beams, the 3×10^{-11} Torr vacuum and the radiation environment presented challenges for the beam monitors. Some of the more interesting instrumentation design and performance during the recent Booster proton commissioning will be described.

7300 (BNL–46794) **Analysis of a high brightness photo electron beam with self field and wake field effects.** Parsa, Z. Brookhaven National Lab., Upton, NY (United States). [1991]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-9108118–39: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE92004983. Source: OSTI; NTIS; INIS; GPO Dep.

High brightness sources are the basic ingredients in the new accelerator developments such as Free-Electron Laser experiments. The effects of the interactions between the highly charged particles and the fields in the accelerating structure, e.g. R.F., Space charge and Wake fields can be detrimental to the beam and the experiments. We present and discuss the formulation used, some simulation and results for the Brookhaven National Laboratory high brightness beam that illustrates effects of the accelerating field, space charge forces (e.g. due to self field of the bunch), and the wake field (e.g. arising from the interaction of the cavity surface and the self field of the bunch).

7301 (BNL–46795) **Effects of variation of the laser pulse width on the laser induced photoelectrons.** Parsa, Z. Brookhaven National Lab., Upton, NY (United States). [1991]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-9108118–40: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE92004984. Source: OSTI; NTIS; INIS; GPO Dep.

The effects of the variation of the Laser pulse width on the laser induced photoelectrons, from the BNL gun is presented, including the variation in the emittance of the beam, which is crucial to the operation of a Free Electron Laser (FEL). The radio-frequency (RF) electron gun with a photocathode in the end wall of an RF cavity is excited by a laser pulse that is synchronized with the RF, is powered by a conventional type SLAC klystron, and is designed to produce a low emittance beam of 4.65 MeV at the gun exit with the field gradient of 100 MV/m on the Cathode.

7302 (BNL–46827) **Design and operation of the AGS Booster Ionization Profile Monitor.** Stillman, A.N.; Thern, R.E.; Van Zwienen, W.H.; Witkover, R.L. Brookhaven National Lab., Upton, NY (United States). [1991]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-9110118–3: Accelerator instrumentation workshop, Newport News, VA (United States), 28-31 Oct 1991). Order Number DE92004987. Source: OSTI; NTIS; INIS; GPO Dep.

The AGS Booster Ionization Profile Monitor (IPM) must operate in a vacuum of about 3×10^{-11} Torr. The ultra-high vacuum imposes certain requirements on detector gain and restrictions on construction techniques. Each detector is a two-stage micro-channel plate with an integral substrate containing sixty-four printed anodes. Formed electrodes provide uniform collection fields without the use of resistors, which would be unacceptable in these vacuum conditions. An ultra-violet light calibrates the detector in its permanent mounting. An extra set of electrodes performs a first order correction to the perturbations imposed by the horizontal and vertical collection electrodes. This paper will present details of the design of the profile monitor and recent operational results. 4 refs., 6 figs.

7303 (BONN-IR–91-33) **Construction and test of a source of polarized electron beams for the injection into the Bonn accelerator facility ELSA.** Voigt, S. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Jun 1991. 43p. (In German). Order Number DE92758863. Source: OSTI; NTIS (US Sales Only); INIS.

The construction and test of a source of polarized electrons is described. The electrons are produced by photoemission with circular polarized Laser light on a GaAs-crystal. The electron beam is accelerated up to an energy of 120 keV which is adapted to the injection energy into the Linac. A spin rotator changes the spin vectors from longitudinal to transversal orientation. The spin rotation is a necessary condition for the further acceleration in the 2.5 GeV-Synchrotron and in ELSA. For the measurement of the polarization degree Mott-scattering on a thin gold target is used. A polarization degree of 30% has been measured. (orig.).

Sponsored by U.S. DOE Energy Research. DOE Contract AS03-89ER40527. Order Number DE92003774. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses research in the following areas of accelerator physics: analysis and design of rf cavities; and rf power sources. (LSP)

7305 (FNAL/C–91/204) **Magnet end design: The main injector dipoles.** Ostiguy, J.F. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1991. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-910505–429: 1991 Institute of Electrical and Electronics Engineers (IEEE) particle accelerator conference (PAC), San Francisco, CA (United States), 6-11 May 1991). Order Number DE92005109. Source: OSTI; NTIS; INIS; GPO Dep.

From the accelerator designer standpoint, one of the quantities of interest in a magnet is the axially integrated transverse field. It is easily shown that the latter satisfies the equations of 2D magnetostatics. This is the basic theoretical result needed to design accelerator magnet ends. Unfortunately, axially integrated fields must be obtained from accurate 3D field maps and magnets ends have historically been designed using a cut and try approach. To a certain extent, this remains true even today; however, the advent of reliable 3D magnet design codes now permits to substantially reduce the costs associated with the construction of various prototypes. In this paper, the theory of magnet end design is reviewed. The design of the end of the dipole magnets of the proposed Fermilab Main Injector is analyzed in a detailed manner using TOSCA, a well-established 3D finite element code. Provided the limitations of the code are well understood by the user, the integrated field profile is satisfactorily predicted.

7306 (FNAL/C–91/218) **An overview of the multilayer insulation system for the Superconducting Super Collider.** Boroski, W.; Nicol, T.; Schoo, C.J. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1991. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (SSCL–503;CONF-910803–6: International congress on refrigeration: new challenges in refrigeration, Montreal (Canada), 10-17 Aug 1991). Order Number DE92005108. Source: OSTI; NTIS; INIS; GPO Dep.

The MLI system for the SSC is designed to meet strict performance requirements over the 25 year life of the accelerator. Thermal measurements at 80K and 20K have been used to create an MLI system that limits heat flow to design values while incorporating features that permit the use of large-scale fabrication techniques. The result is a cost-effective means of mass-producing MLI blankets of consistent geometry and thermal performance.

7307 (FNAL/C–91/246) **Test results from Fermilab 1.5 m model SSC collider dipole magnets.** Koska, W.; Bossert, R.; Carson, J.; Coulter, K.J.; Delchamps, S.; Gourlay, S.; Jaffery, T.S.; Kinney, W.; Lamm, M.J.; Ozelis, J.P.; Strait, J.; Wake, M. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1991. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-910881–29: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92004531. Source: OSTI; NTIS; INIS; GPO Dep.

We will present results from tests of 1.5 m model SSC collider dipole magnets. These R&D magnets are identical to the 15 m full length dipoles currently being assembled at Fermilab in all important aspects except length. Because of their small size they can be built faster and tested more extensively than the long magnets. The model magnets are used to optimize design parameters for, and to indicate the performance which can be expected from, the 15 m magnets. The are instrumented with voltage taps over the first two current blocks for quench localization and with several arrays of strain gauge transducers for the study of mechanical behavior. The stress at the poles of the inner and outer coils is monitored during construction and, along with end force and shell strain, during excitation. Magnetic measurements are made several times during each magnet's lifetime, including at operating temperature and field. We will report on studies of the quench performance, mechanical behavior and magnetic field of these magnets.

7308 (FNAL/C–91/254) **Magnetic field measurements of 1.5 meter model SSC collider dipole magnets at Fermilab.** Lamm, M.J. (Fermi National Accelerator Lab., Batavia, IL (United States)); Bleadon, M.; Coulter, K.J.; Delchamps, S.; Hanft, R.; Jaffery, T.S.; Kinney, W.; Koska, W.; Ozelis, J.P.; Strait, J.; Wake, M.; DiMarco, J. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1991. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (SSCL–541;CONF-910662–16: 12. international conference on magnet technology, Leningrad (USSR), 23-28 Jun 1991). Order Number DE92004530. Source: OSTI; NTIS; INIS; GPO Dep.

Magnetic field measurements have been performed at Fermilab on 1.5 m magnetic length model dipoles for the Superconducting Supercollider. Harmonic measurements are recorded at room temperature before and after the collared coil is assembled into the yoke and at liquid helium temperature. Measurements are made as a function of longitudinal position and excitation current. High field data are compared with room temperature measurements of both the collared coil and the completed yoked magnet and with the predicted fields for both the body of the magnet and the coil ends.

7309 (FNAL/C–91/255) **Mechanical behavior of Fermilab-built 1.5 m model SSC collider dipoles.** Strait, J. (Fermi National Accelerator Lab., Batavia, IL (United States)); Bossert, R.; Carson, J.; Coulter, K.J.; Delchamps, S.; Jaffery, T.S.; Kinney, W.; Koska, W.; Gourlay, S.; Lamm, M.J.; Wake, M.; Sims, R.; Winters, M. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1991. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (SSCL–542;CONF-910662–14: 12. international conference on magnet technology, Leningrad (USSR), 23-28 Jun 1991). Order Number DE92004529. Source: OSTI; NTIS; INIS; GPO Dep.

Several model SSC collider dipole magnets (50 mm aperture, 1.5 m magnetic length) have been built and tested at Fermilab. These magnets are instrumented with strain gauges to measure stresses in the coil, the cold mass shell, and the coil end clamp assembly. Measurements are made of these quantities during assembly, cooldown, excitation, and warmup. Additional mechanical measurements are made on magnet sub-assemblies during manufacturing. Data from these measurements are presented and compared with expectations from the design calculations.

7310 (FNAL/C–91/257) **Quench behavior of 1.5 m model SSC collider dipole magnets at Fermilab.** Wake, M. (Fermi National Accelerator Lab., Batavia, IL (United States)); Bossert, R.; Carson, J.; Coulter, K.; Delchamps, S.; Gourlay, S.; Jaffery, T.S.; Kinney, W.; Koska, W.; Lamm, M.J.; Strait, J.; Sims, R.; Winters, M. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1991. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-910662–15: 12. international conference on magnet technology, Leningrad (USSR), 23-28 Jun 1991). Order Number DE92004528. Source: OSTI; NTIS; INIS; GPO Dep.

The quench behaviors of 10 model dipole magnets for the Superconducting Super Collider have been studied. Horizontally split yoke, vertically split yoke and the latest 50 mm diameter design were compared in the quench characteristics. The excitation results showed a good progress of the R&D program. SSC magnets can now be built with no training to the required field of 6.65 T at 4.3 K.

7311 (FNAL/C–91/311) **A TRD Trigger for the tevatron collider experiment at D0.** Utes, M.; Johnson, M.; Martin, M. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-911106–40: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004118. Source: OSTI; NTIS; INIS; GPO Dep.

A VME-based module for use as an input to the D0 Detector Level 1.5 Trigger is described. Its main function will be the confirmation of electron candidates flagged by the First Level Calorimeter

Trigger using digitized data from the Transition Radiation Detector. Features of the board include the use of fast FIFOs to store incoming track coordinates, dual ported SRAM lookup tables for addressing integrated charge data and forming scalars, multiplier/accumulators for speed of calculation, and a single synchronous finite state machine to control all board operations. 4 refs., 3 figs.

7312 (FNAL-TM–1726) **The effect of particulate debris on the insulation integrity of SSC coils during molding and collaring.** Nehrlich, E.; Markley, F.; Rogers, D. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1991. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-910340–51: 3. annual international industrialization symposium on the super collider (IISSC), Atlanta, GA (United States), 13-15 Mar 1991). Order Number DE92003885. Source: OSTI; NTIS; INIS; GPO Dep.

In order to simulate the effect of accidentally introduced debris on SSC coil insulation integrity, models consisting of two pieces of insulated SSC cable have been loaded in an hydraulic press after introducing foreign particles between the layers. The tests were originally suggested by R. Palmer of the SSC Laboratory. A high voltage (2 Kv) was continually applied between the two cables and the load gradually increased until an electrical short occurred. The high voltage was used as an easy method of detecting insulation punctures and to continue the general type of testing begun at Brookhaven by J. Skaritka, now at the SSC Laboratory, and continued at Fermilab by F. Markley and presented at last year's session of the Conference. A range of particles of different size, shape, and hardness were used, and both conducting and insulating particles were included. Fine wires were also used. When the data are normalized using the control (no particles added), data for each cable batch used, there is a slight correlation between pressure at breakdown and particle size for cables insulated with Kapton only. Adjustment must be made for soft particles that tend to deform and for particles with aspect ratios greater than one. Additional measurements have also been made where the opoxy-fiberglass layer was added to the Kapton insulation overwrap. These show a correlation between conductivity and breakdown pressure. 1 ref., 7 figs.

7313 (FNAL-TM–1728) **Stress relaxation in SSC collared coils and their component materials.** Markley, F.; Corpus, O.; Herdt, B.; Lautenschlager, A.; Rogers, D.; Stadtler, L. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1991. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-910340–52: 3. annual International Industrialization Symposium on the Super Collider (IISSC), Atlanta, GA (United States), 13-15 Mar 1991). Order Number DE92004676. Source: OSTI; NTIS; INIS; GPO Dep.

Previous work, reported at last year's meeting, has been continued. One model section of an SSC outer coil has had it's stress relaxation measured for nearly two years. In addition, the stress relaxation of SSC cable without insulation has been measured. Kapton insulation alone has been studied both in creep and stress relaxation. Creep has been measured parallel to the plane of the film. These measurements are dependent on internal stresses that may be present in the film and on the moisture content of the film. They indicate that any measurements of coil relaxation are not likely to be repeatable if these factors are not controlled. The measurements on Kapton film alone are being done at different temperatures to obtain a time-temperature shift factor so that measurements at one temperature may be used to predict relaxation at any other temperature. 12 refs., 8 figs.

7314 (FNAL-TM–1761) **T839 fiber tracking transporter at New Muon Lab.** Krider, J. Fermi National Accelerator Lab., Batavia, IL (United States). 23 Oct 1991. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE92003899. Source: OSTI; NTIS; INIS; GPO Dep.

A darkbox and its transporter have been designed for T839 fiber tracking tests. The darkbox is 3.35 m x 0.76 m x 0.25 m (1·w·h) and contains a scintillating fiber ribbon suspension system and mechanical hardware to support the readout electronics. The transporter provides 3.0 m of horizontal motion transverse to the beam for linear scans of fiber characteristics. In addition, 70 degrees of rotation about a vertical axis is provided to simulate tracking of particles emanating from a collision point at lab angles in the range 0°–70°. The transporter, which is located inside a radiation area, is remotely controlled to permit scanning the fiber array through the region defined by four small stationary triggering scintillators without disabling beam. The transporter rails extend 20 feet to the west beyond a gate in the radiation enclosure fencing. This provides a staging area to work on the apparatus, while the beam is on. 4 figs.

7315 (INFN-TC–89-12) **Analog control loops for the Milan K800 cyclotron RF system.** Bosotti, A. (Istituto Nazionale di Fisica Nucleare, Milan (Italy)); Pagani, C.; Di Giacomo, M.; Gallo, A. Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1989. 16p. Order Number DE92612846. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper the desing criteria and the main features of the two analog feedback loops which are used to control the phase and the amplitude stability of the Milan Superconducting Cyclotron accelerating voltage are described, together with the resonator fine tuning system. The experimental results, obtained during the full power tests of the first RF cavity, are also presented. A phase stability better than ±0.2 grade centigrades and an amplitude modulation noise below $5 \cdot 10^{-5}$ at 100 kV peak dee voltage were routinely achieved all over the frequency range (15/48 MHz).

7328 (JHP–17) **Brief report of the design work on buildings of the Japanese Hadron Project, 1.** Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Apr 1991. 32p. (In Japanese). Order Number DE92751042. Source: OSTI; NTIS (US Sales Only); INIS.

A brief report of the design work on buildings of the Japanese Hadron Project has been published as a JHP-report (JHP-15). The design of the buildings has to be modified to fulfill the detailed design works on accelerators and experimental facilities which are in still progress. Modification of drawings ie easy if they are prepared as data in a CAD system. Most of the drawings have therefore been newly prepared as data in the CAD system. Some of the drawings in JHP-15 have been modified to meet the recent study of the beam line optics requirements for the JHP beam line. The CAD system used is MiniCad+ by GRAPHSOFT INC. Data of drawings in 3.5 inch floppy disks can be distributed. (author).

7329 (JHP–18) **Report of the workshop on the radiation safety system for the high-intensity high-energy accelerator facility.** Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jun 1991. 128p. (In Japanese). Order Number DE92751043. Source: OSTI; NTIS (US Sales Only); INIS.

A workshop on the radiation safety system for the high-intensity high-energy accelerator facility was held to discuss variety of subjects related to the radiation safety system for the accelerator facility. As several large accelerator facilities are now under construction; a ring cyclotron (RCNP, Osaka Univ.), a cyclotron of the Ion-Beam Facility (JAERI-TRCRE), a heavy-ion synchrotron (National Institute of Radiological Sciences), and a large synchrotron radiation facility (SPring-8), and high-intensity high-energy accelerator facilities are now being planned; JHP (INS, Univ. of Tokyo), high-intensity linear accelerator complex (JAERI, Tokai R.E.), and high-intensity electron accelerator complex (PNC, Tokai), it is a good chance to have a workshop to discuss with those who are working for the design of the radiation safety system for these facilities. The subjects discussed were shielding calculations, experiments on shielding, development of high-intensity beam line components, radiation control at the high-intensity beam facility, monitoring system, and design of shielding for accelerator facilities. (author).

This paper describes progress that has been made at the Manuel Lujan Jr. Neutron Scattering Center (LANSCE) during the past two years. Presently, LANSCE provides a higher peak neutron flux than any other pulsed spallation neutron source. There are seven spectrometers for neutron scattering experiments that are operated for a national user program sponsored by the U.S. Department of Energy. Two more spectrometers are under construction. Plans have been made to raise the number of beam holes available for instrumentation and to improve the efficiency of the target/moderator system. (author).

7331 (KEK–90-25(v.1), pp. 119-133) **Enriched vs non-enriched vs non-fissile targets for pulsed spallation neutron sources.** Carpenter, J.M. (Argonne National Lab., IL (United-States)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Numerous options exist among alternatives for target material and design of the neutron producing target in pulsed spallation neutron sources. This report surveys the advantages, disadvantages and limitations of some of the alternatives, including discussions of neutron yields, delayed neutron backgrounds, source pulse widths, source-to-moderator coupling, materials performance, fabrication problems, safeguards and security and hazards questions. Status of the INR linear accelerator, the proton storage ring as a compressor ring of the Moscow meson factory are discussed. (author).

7334 (KEK–90-25(v.1), pp. 218-223) **High-power 'Regotron'-type microwave generator for intensive technological accelerators.** Batskikh, G.I. (AN SSSR, Moscow (USSR). Radiotekhnicheskij Inst.); Murin, B.P.; Durkin, A.P.; Shlygin, O.Yu.; Shumakov, I.V. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Theoretical principles and the construction scheme of the super-power microwave relativistic electron beam (REB) 'Regotron'-type generator are presented. The generator is supposed to be used for the accelerating cavities power supply of the intensive accelerator. To increase the device efficiency the autophasing-principle is used. The regotron efficiency can reach 70...80% with output power up to 5...10 MW in the continuous mode. (author).

7335 (KEK–90-25(v.1), pp. 224-234) **Treatment of H^0 and H^- beams spilled at the stripper foil at full energy charge-exchange injection scheme.** Yamane, Isao (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

The charge-exchange injection into a synchrotron to generate high-intensity pulsed proton beams for a spallation neutron source is reviewed while focusing on the treatment of H^0 and H^- beams spilled at the stripper foil. After charge-exchange injection is briefly outlined, scattering by foil atoms and causes to spill H^0 and H^- beams are described. These spilled beams can amount to several μA and should be carefully treated. It is then shown that a direct H^- injection system needs to be considerably long and requires a very long straight section. Because of its simplicity, two-step H^0 injection has very wide applicability to various types of rings. However, it has a problem of emittance growth due to angular divergence in the stripper magnet and an ionoptical mismatch at the stripper foil. These problems are discussed, including a new proposal for a measure to remedy this problem. The laser photoionization injection is also briefly mentioned. (author).

7336 (KEK–90-25(v.1), pp. 235-241) **Perfect matching for two-step H^0 injection into a ring with a DBFO lattice and minimization of the overall emittance growth.** Yamane, Isao (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

A procedure is given for achieving perfect matching in two-step H^0 injection into a DBFO lattice. It is at first shown that the foil should be located between B and F and the stripper magnet should be set so that the bending plane is vertical in order to make the H^0 beam match the ring optics. Then, the Twiss parameters of the H^- beam are determined so as to be converted to those of the H^0 beam which matches the ring optics through the charge-exchange process in the stripper magnet. It is shown that, though perfect matching at the foil can be achieved, the emittance growth in the stripper magnet can not be made to completely disappear. A factor K is defined as a measure of the emittance growth in the stripper magnet. When C is the mismatch factor at the foil, (KxC) is a measure of the total emittance growth during the entire charge-exchange process. The (KxC) factor should be minimized in an actual application, resulting that a small K as well as a small C will remain. (author).

7337 (KEK–90-25(v.1), pp. 242-246) **System for generating double-pulsed magnetic fields in a kicker magnet.** Kawakubo, Tadamichi (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Tazawa, Sichiro; Arakida, Yosio; Murasugi, Sigeru. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Two bunched beams are accelerated in the 1A ring of JHF. They are extracted for meson experiments and for neutron experiments successively. Therefore, the extraction kicker magnet should generate double-pulsed magnetic fields at intervals of about 100 μsec, with a repetition rate of 50 Hz. In order to test the feasibility of generating double pulses, we used two sets of thyratron housings and a kicker magnet for the KEK-PS-extraction system, which has an impedance of 25 Ω. Using a thyratron cathode-loaded system, the first firing induces a second misfire by a rapid voltage drop of the second thyratron cathode. A thyratron anode-loaded system does not have the above-mentioned trouble, and has succeeded in generating the desired double pulses with half of the voltage required for the usual operation of JHF (≈ 80kV). (author).

7338 (KEK–90-25(v.1), pp. 251-258) **Present status of the test rf system for the KEK PS Booster.** Ninomiya, S. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Takano, S.; Yoshii, Y.; Toda, M.; Katori, T. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Since 1988 we have been constructing a new accelerating system for the KEK PS Booster. The system cancels the beam loading effect. The system test operation result is reported. Our analysis on the beam loading effect is also described. (author).

7339 (KEK–90-25(v.1), pp. 262-269) **Experimental RF proton accelerator with superconducting solenoid beam focusing.** Bondarev, B.I. (AN SSSR, Moscow (USSR). Radiotekhnicheskij Inst.); Griasnov, N.A.; Keilin, V.E. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Theoretical and applied aspects of a beam current increase in ion linacs by using superconducting solenoid focusing are considered. Results of the SIU-1 experimental RF proton accelerator development and testing are presented. The main accelerator parameter are : the 1.5 MeV energy, the 1.75 MeV/m accelerating rate, the 200 MHz operating frequency. (author).

7340 (KEK–90-25(v.1), pp. 270-278) **Particle tracking in the BSF beamline.** Adachi, T. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

A particle-tracking program for transverse motion was developed. It is used to calculate the particle trajectory affected by dipole and quadrupole magnetic fields. The calculation also considers multiple Coulomb scattering and energy loss in matter. The program was applied to a transport line for a 500-MeV proton beam. The result was compared with beam profiles and residual radioactivities measured along the beamline. (author).

7341 (KEK–90-25(v.1), pp. 319-334) **The neutronic performance of solid-target alternatives for SINQ.** Atchison, F. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

The results from calculations of the neutronic performance of three possible 'solid' targets and that of the current version of the liquid Pb-Bi target are presented. Two are 'conventional' transverse cooled plate structures, one using tantalum, the other tungsten. The third is a Pb-shot based pebble-bed design. Some general results on the effect of neutron absorption on the performance of the Pebble-bed target are given. (author).

7342 (KEK–90-25(v.1), pp. 335-339) **Split-target neutronics.** Russell, G.J. (Los Alamos National Lab., NM (United States)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Monte Carlo simulations show that, for the LANSCE split-target of machineable tungsten, about 60% of the low-energy (<20 MeV) neutron leakage from the target comes from primary (800-MeV) proton interactions. The remaining 40% occurs from secondary high-energy reactions in the split-target. Primary protons are forward directed; secondary high-energy (>20 MeV) particles are also forward directed. Consequently, the neutronic performance of the LANSCE Target-Moderator-Reflector-Shield (TMRS) system is not adversely impacted by employing a split-target. Implementing a split-target allows us to use flux-trap moderators around the void zone between the targets to simultaneously service twelve neutron flight paths. (author).

7343 (KEK–90-25(v.1), pp. 340-353) **Neutron emission from an extended lead target under the action of light ions in the GeV region.** Vassil'kov, R.G. (AN SSSR, Moscow (USSR). Radiotekhnicheskij Inst.); Yurevich, V.I. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental data are presented on yields and spectra of neutrons, emitted from a lead cylinder ϕ20 x 60 cm, bombarded by beams of p, d, ^{3}He, ^{4}He, ^{12}C with energies 1-7, 3 GeV per unit of ion charge. Measurements have been carried out by the neutron moderation technique and with solid state nuclear track detectors (SSNTD). The results obtained will be used as a scientific base for the power accelerator-based neutron sources. (author).

7344 (KEK–90-25(v.1), pp. 369-375) **Shutter system for the SINQ neutron guides.** Anderson, I. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Ehrat, J.; Suhi, D.; Wagner, W. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Viewing the liquid D_2 cold moderator of the spallation source SINQ, a neutron guide system will be provided to achieve an efficient transport of subthermal neutrons to the instruments in the remote experimental hall. Four separate neutron guides are forseen, with an option for a fifth one to be installed in future. The concept of guide shielding and performance includes a set of shutters, situated at the outside of the main target shielding, with the dual purpose of shielding the radiation from the target and inner shielding in the closed position and guiding the neutron beam in the open position. This latter function imposes strict requirements on alignment accuracy and mechanical stability while the necessity of shielding high energy neutrons from the spallation target implies the use of bulky shielding. The technical concept elaborated to fulfill these requirements is presented. (author).

7345 (KEK–90-25(v.1), pp. 379-387) **Recent experience with IPNS moderators.** Carpenter, J.M. (Argonne National Lab., IL (United States)); Scott, T.L. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

We describe experience with the moderators of IPNS in the two years since the installation of the Enriched Uranium Booster Target. (author).

7346 (KEK–90-25(v.1), pp. 388-400) **Optimization studies on coupled liquid hydrogen moderator.** Kiyanagi, Y. (Hokkaido Univ., Sapporo (Japan). Faculty of Engineering); Iwasa, H.; Fujikawa, I.; Watanabe, N.; Furusaka, M. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

Optimization studies on a coupled liquid-hydrogen-moderator system were performed experimentally and the results were compared with those of decoupled liquid hydrogen and solid methane moderators. A very high gain factor is obtained. Pulse characteristics were also studied and it is found that the pulse broadening by coupling is rather modest. (author).

7347 (KEK–90-25(v.1), pp. 401-407) **Reflector optimization for coupled liquid hydrogen moderator.** Kiyanagi, Y. (Hokkaido Univ., Sapporo (Japan). Faculty of Engineering); Iwasa, H.; Watanabe, N.; Furusaka, M. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

As a part of optimization studies on a coupled liquid hydrogen moderator system, the optimal thickness of the reflector, the effects of neutron absorbing liners and other beam hole/moderator on the cold-neutron-beam intensity were studied experimentally. It turns out that the optimal thickness is rather thick in this system and the existence of Cd liners around the beam extraction hole considerably reduces the cold neutron beam intensity, while the existence of other beam hole and moderator does not give an important intensity reduction. (author).

7348 (KEK–90-25(v.1), pp. 408-415) **Some neutronic studies on flux-trap type moderator.** Kiyanagi, Y. (Hokkaido Univ., Sapporo (Japan). Faculty of Engineering); Watanabe, N. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

The neutronic performance of a flux-trap type moderator was studied by computer simulation in connection with the KENS-II target-moderator system. It was confirmed that this system can provide 1.3-1.4 times higher neutron intensity than a traditional wing-geometry moderator system. (author).

7349 (KEK–90-25(v.1), pp. 416-429) **Theoretical thermal-hydraulic investigations of the operational and safety features of the cold D_2-moderator for SINQ.** Skala, K. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Spitzer, H.; Bauer, G.S. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

In order to be able to investigate the behaviour of the gas-liquid mixture in the rather complex vessel and pipe system of the cold D_2-moderator with heat exchanger and ballast volume, a computational model of the system has been set up. The model was first benchmarked against experimental data from the cold moderator mockup for the second cold source at the ILL Grenoble. It was then used to predict operational parameters such as pressure, velocity, moisture content and others of the system under normal conditions with the anticipated distribution of heat influx. Finally, the case of total loss of insulating vacuum was investigated. (author).

7350 (KEK–90-25(v.1), pp. 430-443) **Technical concept of the liquid D_2-cold moderator for SINQ.** Spitzer, H. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Hoechli, A.; Bauer, G.S.; Wagner, W. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

At the continuous, high power Spallation Source SINQ design provisions have been made in the D_2O-moderator tank for both, a D_2- and H_2-cold moderator. While the H_2-moderator will be available as a long term option, the D_2-moderator, equipped with a neutron guide system will be a day-one facility to provide the low-energy neutrons for the guide-hall instrumentation. The paper describes details of the technical concept of the D_2-cold moderator which takes into account boundary conditions, considerations on flux optimization, operational feasibility and safety. (author).

7351 (KEK–90-25(v.1), pp. 444-453) **Thermodynamic considerations on self-regulating characteristics of a cold neutron source with a closed thermosiphon.** Kawai, Takeshi (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.); Utsuro, Masahiko; Ogino, Fumimaru. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

The present report describes that a cold neutron source (CNS) having a closed-thermosiphon cooling loop shows a self-regulating characteristic under thermal disturbances if the effect of the moderator transfer tube is negligible. Due to this property, the liquid level in the moderator cell is kept almost constant under thermal disturbances. The thermodynamic meaning of the self-regulating property in the idealized closed-thermosiphon and the effect of the moderator transfer tube to the self-regulation are described. (author).

7352 (KEK–90-25(v.1), pp. 463-470) **Simultaneous pulsed/integral neutron facility optimization.** Thorson, I.M. (TRIUMF, Vancouver, BC (Canada)). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

The possibilities and compromises necessary in the design of a neutron facility that would serve both pulsed and time integral users simultaneously are examined. (author).

7353 (KEK–90-25(v.1), pp. 471-477) **A design concept of target-moderator-reflector assemblies for KENS-II: A high-efficiency pulsed spallation neutron source.** Watanabe, N. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. (CONF-9010243–: International collaboration on advanced neutron sources (ICANS), Tsukuba (Japan), 21-26 Oct 1990). In *Proceedings of the eleventh meeting of the international collaboration on advanced neutron sources (ICANS-XI).* 654p. Order Number DE92713960. Source: OSTI; NTIS (US Sales Only); INIS.

A design concept of KENS-II target-moderator-reflector assemblies is described. One of the assemblies is dedicated to the cold neutron source, and the other, to the thermal and epithermal neutron source. A flux-trap type moderator-configuration was adopted with a vertical proton-beam injection scheme. All moderators for the cold neutron source are coupled liquid hydrogen moderators with premoderators. A new scheme of proton beam delivery is proposed. The new system can provide several times higher total performance than a reference system based on a traditional single assembly with all decoupled moderators in a wing geometry and with a horizontal proton-beam injection scheme. (author).

7354 (KEK–91-4) **Evaluation of wake fields of disk loaded structure for Japan Linear Collider.** Takao, M.; Higo, T.; Takata, K. National Lab. for High Energy Physics, Tsukuba, Ibaraki

(Japan). Jul 1991. 25p. Order Number DE92751023. Source: OSTI; NTIS (US Sales Only); INIS.

The numerical estimation of the long range wake fields of the accelerating structure for JLC was carried out by using various computer codes; TBCI, KN7C, TRANSVRS, and URMEL. It provides the basis of the argument on the energy distribution or the emittance growth of a multi-bunched beam. A large portion of the transverse wake field was found to be occupied by a dominant mode, lowest in frequency, while the contribution of the other modes were found at most twenty percent. On the wake field of the dominant mode, the estimation of the amount calculated by the above codes agreed within ten percent. The dependence of the wake fields on a geometric variation, i.e. an aperture, was also investigated. (author).

7355 (KEK–91-6) **Progress during the decade of the BSF beam-line.** Irie, Yoshiro; Adachi, Toshikazu; Yano, Yoshiharu; Fujimori, Hiroshi; Kaneko, Naokatsu; Kobayashi, Yasuo; Tahara, Toshihiro. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jul 1991. 39p. Order Number DE92751025. Source: OSTI; NTIS (US Sales Only); INIS.

Since the Booster Synchrotron Utilization Facility (BSF) came into operation in June, 1980, ten years have passed. This report summarizes the development of beam-line hardware and software system during the decade. Especially, the result on radiation protection along the beam-line is satisfactory. (author).

7356 (KURRI-TR–345, pp. 48-56) **Development of high performance neutron source using spallation: Neutron experiment facilities in the Japanese Hadron Project.** Watanabe, Noboru (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Mar 1991. (In Japanese). (CONF-9008225–: Specialists' meeting on physics and engineering of fission and spallation; Specialists' meeting on physics and engineering of fission and spallation, Kumatori (Japan); Kumatori (Japan), 2 Aug 1990; 10 jan 1991; CONF-9101117–). In *Proceedings of the specialists' meeting on physics and engineering of fission and spallation, 1990.* 118p. Order Number DE92713857. Source: OSTI; NTIS (US Sales Only); INIS.

One of the most important applications of nuclear fission and nuclear spallation is high performance neutron sources. The neutron sources mentioned here are those used for beam experiment in the research on material science and the basic physics of atomic nuclei and others. In the spallation neutron sources using medium energy proton accelerators, in the case of using nonactinide targets, nuclear fission takes part in addition to nuclear spallation, and in actinide system, nuclear fission and nuclear spallation coexist. The most important thing as high performance spallation neutron sources is that cold, thermal and epithermal neutron fluxes as high as possible can be obtained. As the spallation neutron source in Japan, KENS-1 was completed in 1980 for the first time in the world. KENS-2 is planned as a part of the Japanese Hadron Project. The optimization of a proton accelerator, the targets for generating neutrons, the coupling of a target with moderator, cold neutron sources and the distribution of proton pulses to a target, moderator and reflector assembly, and the new method of proton beam incidence are reported. (K.I.).

7357 (LA-UR–91-3908) **Existing muon beams at LAMPF.** Pillai, C. Los Alamos National Lab., NM (United States). [1991]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-9105295–1: Philsosphenweg 12, Heidelberg (Germany), 7-9 May 1991). Order Number DE92005073. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the production of muon beams at LAMPF. The backward decay beam, forward decay beam, surface beam, cloud muon beam, and pion beams are all briefly discussed. (LSP)

7358 (LA-UR–91-4150) **Theory and modeling of a relativistic klystron amplifier with high space charge for microsecond applications.** Carlsten, B.E.; Fazio, M.V.; Faehl, R.J.; Kwan, T.J.; Rickel, D.G.; Stringfield, R.M. Los Alamos National Lab., NM (United States). [1992]. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-920124–1: Society of Photo-Optical Instrumentation Engineers' international symposium on laser spectroscopy as part of SPIE's symposium on optics, electro-optics and laser applications in science and engineering, Los Angeles, CA (United States), 19 Order Number DE92004576. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss basic Relativistic Klystron Amplifier physics. We show that in the intense space-charge regime the maximum power extraction does not coincide with the maximum harmonic bunching. In addition, we show that as the beam is bunched, the additional power stored in the Coulomb fields does not add significantly to the overall power extraction. Because of these effects, the power extraction at 1.3 GHz for a 500 kV, 5 kA beam with reasonable beam-to-wall spacing is limited to around 35%. 3 refs., 17 figs.

7359 (LBL–29973-Rev.) **Magnetic measurements at Lawrence Berkeley Laboratory: Revision.** Green, M.I.; Barale, P.; Callapp, L.; Case-Fortier, M.; Lerner, D.; Nelson, D.; Schermer, R.; Skipper, G.; Van Dyke, D.; Cork, C.; Halbach, K.; Hassenzahl, W.; Hoyer, E.; Marks, S.; Harten, T.; Luchini, K.; Milburn, J.; Tanabe, J.; Zucca, F.; Keller, R.; SLawrence Livermore National Lab., CA (United States). Aug 1991. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-910662–13-Rev.: 12. international conference on magnet technology, Leningrad (USSR), 23-28 Jun 1991). Order Number DE92004305. Source: OSTI; NTIS; INIS; GPO Dep.

Recent magnetic measurement activities at LBL have been concentrated in two separate areas, electro-magnets and permanent magnets for the Advanced Light Source (ALS), and superconducting magnets for the Superconducting Super Collider Laboratory (SSCL). A survey of the many different measurement systems is presented. These include: AC magnetic measurements of an ALS booster dipole engineering model magnet, dipole moment measurements of permanent magnet blocks for ALS wigglers and undulators, permeability measurements of samples destined for wiggler and undulator poles, harmonic error analysis of SSC one meter model dipoles and quadrupoles and five meter long SSC prototype quadrupoles, harmonic error analysis of ALS dipoles, quadrupoles, and sextupoles, precision Hall probe mapping of ALS storage ring combined function magnets, and the design of the ALS insertion device magnets mapping system. We also describe a new UNIX based data acquisition system that is being developed for the SSC. Probes used for magnetic measurements include Helmholtz coils, integral coils, point coils, and bucking harmonic analysis coils, several different types of Hall probes, and nuclear magnetic resonance magnetometers. Both analog and digital integrators are used with the coils. Some problems that occurred and their rectification is described. The mechanisms used include rotating systems with optical encoders, X-Y mapping systems with optical encoders and a laser position measuring device. 10 refs., 3 figs., 1 tab.

7360 (LBL–30672) **Performance of hole coupling resonator in the presence of asymmetric modes and FEL gain.** Xie, Ming; Kim, Kwang-Je. Lawrence Berkeley Lab., CA (United States). Aug 1991. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-9108118–33: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE92003907. Source: OSTI; NTIS; INIS; GPO Dep.

We continue the study of the hole coupling resonator for free electron laser (FEL) application. The previous resonator code is further developed to include the effects of the azimutally asymmetric modes and the FEL gain. The implication of the additional higher order modes is that there are more degeneracies to be avoided in tuning the FEL wavelengths. The FEL interaction is modeled by constructing a transfer map in the small signal regime and incorporating it into the resonator code. The FEL gain is found to be very effective in selecting a dominant mode from the azimuthally symmetric class of modes. Schemes for broad wavelength tuning based on passive mode control via adjustable apertures are discussed. 12 refs., 7 figs., 1 tab.

7361 (ORNL/TM–11854) **A short report on voltage-to-frequency conversion for HISTRAP RF system tuning control loops.** Hasanul Basher, A.M. Oak Ridge National Lab., TN (United States). Sep 1991. 26p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92004106. Source: OSTI; NTIS; INIS; GPO Dep.

One of the requirements of the HISTRAP RF accelerating system is that the frequency of the accelerating voltage for the cavity must keep in step with the change in the magnetic field. As the energy of the particle increases, the magnetic field is increased to keep the radius of the particle orbit constant. At the same time, the frequency of the electric field must be changed to insure that it is synchronized with the angular movement of the particle. So we need to generate the frequency of the accelerating voltage in relation to the magnetic field. The frequency generation can be accomplished in two stages. The first stage of frequency generation consists of measuring the magnetic field in terms of voltage which is already developed. The second stage is to convert this voltage into frequency. Final frequency precision can be achieved by deriving a frequency-correcting signal from the beam position. This project is concerned with generating the frequency from the analog voltage. The speed of response required will place very stringent requirements on both hardware and software. Technology is available to carry out this task. A hardware configuration has been established and software has been developed. In the following section, we describe the implementation strategy, the hardware configuration, and the desired specifications. Next, we present the software developed, results obtained, along with capabilities and limitations of the system. Finally, we suggest alternate solutions to overcome some of the limitations toward meeting our goal. In the appendices, we include program listings.

7362 (ORNL/TM–11928) **Development of a remote control console for the HHIRF 25-MV tandem accelerator.** Hasanul Basher, A.M. Oak Ridge National Lab., TN (United States). Sep 1991. 40p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92004107. Source: OSTI; NTIS; INIS; GPO Dep.

The CAMAC-based control system for the 25-MV Tandem Accelerator at HHIRF uses two Perkin-Elmer, 32-bit minicomputers: a message-switching computer and a supervisory computer. Two operator consoles are located on one of the six serial highways. Operator control is provided by means of a console CRT, trackball, assignable shaft encoders and meters. The message-switching computer transmits and receives control information on the serial highways. At present, the CRT pages with updated parameters can be displayed and parameters can be controlled only from the two existing consoles, one in the Tandem control room and the other in the ORIC control room. It has become necessary to expand the control capability to several other locations in the building. With the expansion of control and monitoring capability of accelerator parameters to other locations, the operators will be able to control and observe the result of the control action at the same time. Since the new control console will be PC-based, the existing page format will be changed. The PC will be communicating with the Perkin-Elmer through RS-232 and a communication software package. Hardware configuration has been established, a communication software program that reads the pages from the shared memory has been developed. In this paper, we present the implementation strategy, works completed, existing and new page format, future action plans, explanation of pages and use of related global variables, a sample session, and flowcharts.

7363 **A Stripline Fast Faraday Cup for measuring GHz structure of ion beams.** Bogaty, J.M. To Dept. of Energy. 1990. Filed date 3 Jul 1990. USA Patent patent application 7-547,748. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE92003819. Source: OSTI; NTIS; GPO Dep.

The Stripline Fast Faraday Cup is a device which is used to quantitatively and qualitatively measure gigahertz time structure characteristics of ion beams with energies up to at least 30 Mev per nucleon. A stripline geometry is employed in conjunction with an electrostatic screen and a Faraday cup to provide for analysis of the structural characteristics of an ion beam. The stripline geometry allows for a large reduction in the size of the instrument while the electrostatic screen permits measurements of the properties associated with low speed ion beams.

7364 (SLAC-PUB–5640) **Stanford Linear Collider magnet positioning.** Wand, B.T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Aug 1991. 75p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-920332–1: 1992 American Society for Photogrammetry and Remote Sensing/American Congress on Surveying and Mapping (ASPRS/ACSM) annual convention, Albuquerque, NM (United States), 3-5 Mar 1992). Order Number DE91018883. Source: OSTI; NTIS; INIS; GPO Dep.

For the installation of the Stanford Linear Collider (SLC) the positioning and alignment of the beam line components was performed in several individual steps. In the following the general procedures for each step are outlined. The calculation of ideal coordinates for the magnets in the entire SLC will be discussed in detail. Special emphasis was given to the mathematical algorithms and geometry used in the programs to calculate these ideal positions. 35 refs., 21 figs.

7365 (SLAC-PUB–5698) **High current transistor pulse generator.** Nesterov, V.; Cassel, R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1991. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-911106–31: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004774. Source: OSTI; NTIS; INIS; GPO Dep.

A solid state pulse generator capable of delivering high current trapezoidally shaped pulses into an inductive load has been developed at SLAC. Energy stored in the capacitor bank of the pulse generator is switched to the load through a pair of Darlington transistors. A combination of diodes and Darlington transistors is used to obtain trapezoidal or triangular shaped current pulses into an inductive load and to recover the remaining energy in the same capacitor bank without reversing capacitor voltage. The transistors work in the switch mode, and the power losses are low. The rack mounted pulse generators presently used at SLAC contain a 660 microfarad storage capacitor bank and can deliver 400 amps at 800 volts into inductive loads up to 3 mH. The pulse generators are used in several different power systems, including pulse to pulse bipolar power supplies and in application with current pulses distributed into different inductive loads. The current amplitude and discharge time are controlled by the central computer system through a specially developed multichannel controller. Several years of operation with the pulse generators have proven their consistent performance and reliability. 8 figs.

7366 (SSCL–340) **Phase-control scheme for synchronous beam transfer from the low energy booster to the medium energy booster.** Mestha, L.K. Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1991. 41p. Sponsored by U.S. DOE Energy Research. DOE Contract AC35-89ER40486. Order Number DE92004112. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the design philosophy of the new synchronization scheme for beam transfer from the Low Energy Booster (LEB) to the Medium Energy Booster at the Superconducting Super Collider. The fundamental principle of controlling the LEB acceleration is discussed. A generalized mathematical model is derived to facilitate the design of multiple feedback loops to control the synchronizing phase and the radial position of the beam. Applications of state feedback, sliding-mode and model reference controllers are discussed. Although the state feedback controller is easy to design and implement, the simulation results show that the controller properties are not useful to handle disturbance due to field errors and variation in the system parameters. The sliding-mode and model reference controllers are shown to have more suitable properties. At the end, mention of the hardware used to establish the "proof-of-principle" is given. 17 refs., 35 figs.

7367 (SSCL–479) **Supercomputing activities at the SSC Laboratory.** Yan, Y.; Bourianoff, G. Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1991. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC35-89ER40486. Order Number DE92005177. Source: OSTI; NTIS; INIS; GPO Dep.

Supercomputers are used to simulate and track particle motion around the collider rings and the associated energy boosters of the Superconducting Super Collider (SSC). These numerical studies will aid in determining the best design for the SSC.

7368 (SSCL–559) **Beam control feedback loops for the low energy booster.** Mestha, L.K. Superconducting Super Collider

Lab., Dallas, TX (United States). Oct 1991. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC35-89ER40486. Order Number DE92004955. Source: OSTI; NTIS; INIS; GPO Dep.

There are several feedback loops associated with a basic low-level rf system for the Low Energy Booster (LEB) of the Superconducting Super Collider. The goal of the system is to be able to bunch the beam, accelerate it, and extract it to the Medium Energy Booster (MEB). A precise control of the frequency, phase, and amplitude of the cavity gap voltage is required. Although, the number of parameters to be ultimately controlled does not appear to be high, in practice controlling them is complicated. Hence we have made an effort here to outline all the necessary feedback loops, including those being used for the cavity. Requirements and design goals for some of them are highlighted.

7369 (SSCL-Preprint–6) **About the mechanics of SSC dipole magnet prototypes.** Devred, A. (Superconducting Super Collider Lab., Dallas, TX (United States)); Bush, T.; Coombes, R.; DiMarco, J.; Goodzeit, C.; Kuzminski, J.; Puglisi, M.; Radusewicz, P.; Sanger, P.; Schermer, R.; Spigo, G.; Tompkins, J.; Turner, J.; Wolf, Z.; Yu, Y.; ZheSuperconducting Super Collider Lab., Dallas, TX (United States). Nov 1991. 63p. Sponsored by U.S. DOE Energy Research. DOE Contract AC35-89ER40486. (LBL–31571;FNAL/Pub–91/330;CONF-8908289–1: The physics of particle accelerator school, Brookhaven, IL (United States), Aug 1989). Order Number DE92004526. Source: OSTI; NTIS; INIS; GPO Dep.

During the last two years, nine 4-cm-aperature, 17-m-long dipole magnet prototypes were produced by Brookhaven National Laboratory (BNL) under contract with the Superconducting Super Collider (SSC) Laboratory. These prototypes are the last phase of a half-decade-long R&D program, carried out in collaboration the Fermi National Accelerator Laboratory and Lawrence Berkeley Laboratory, and aimed at demonstrating the feasibility of the SSC main-ring dipole magnets. They also lay the groundwork for the 5-cm-aperture dipole magnet program now underway. After reviewing the design features of the BNL 4-cm-aperature, 17-m-long dipole magnets, we describe in detail the various steps of their fabrication. For each step, we discuss the parameters that need to be mastered, and we compare the values that were achieved for the nine most recent prototypes. The data appear coherent and reproducible, demonstrating that the assembly process is under control. We then analyze the mechanical behavior of these magnets during cooldown and excitation, and we attempt to relate this behavior to the magnet features. The data reveal that the mechanical behavior is sensitive to the collar-yoke interference and that the magnets exhibit somewhat erratic changes in coil end-loading during cooldown.

7370 (UCRL–53868-90, pp. 1.19-1.23) **AMOS accelerator modeling code development.** Shang, C.C.; DeFord, J.F. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90*. 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors describe a new numerical procedure by which field calculations in AMOS are upgraded to more accurately model rotationally symmetric cavity structures such as accelerator cells. Their development work is aimed at implementing a modified finite difference update scheme on an irregular grid system. Elements of an irregular grid may be chosen to fit object boundaries more closely, giving an increased solution accuracy. Their approach involves the placement of field components on a conforming electric field grid and on a magnetic field dual grid which is orthogonal to the primary grid. They find that this procedure retains several important computational advantages, including the ability to exploit the implied spatial relationships between nodes. Propagating fields on an irregular grid system have been observed, and comparisons between finite difference AMOS and Modified-Yee AMOS field calculations are provided.

7371 (BNL–46799) **40-Å FEL designs for the PEP storage ring.** Fisher, A.S. (Brookhaven National Lab., Upton, NY (United States)); Gallardo, J.C.; Nuhn, H.D.; Tatchyn, R.; Winick, H.; Pellegrini, C. Brookhaven National Lab., Upton, NY (United States). [1991]. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016 ;AC03-76SF00515. (CONF-9108118–37: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE92005037. Source: OSTI; NTIS; INIS; GPO Dep.

We explore the use of the 2.2-km PEP storage ring at SLAC to drive a 40-Å free-electron laser in the self-amplified spontaneous emission configuration. Various combinations for electron-beam and undulator parameters, as well as special undulator designs, are discussed. Saturation and high peak, in-band, coherent power (460 MW) are possible with a 67-m, hybrid permanent-magnet undulator in a ring bypass. A 100-m, cusp-field undulator can achieve high average, in-band, coherent power (0.25 W) in the main ring. The existing, 25.6-m, Paladin undulator at LLNL, with the addition of optical-klystron dispersive sections, is considered for both peak and average power. 35 refs., 4 figs., 1 tab.

7372 (BNL–46810) **Performance and upgrades of the NSLS storage rings and photon sources.** Brookhaven National Lab., Upton, NY (United States). [1991]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-910730–27: 4. international conference on synchrotron radiation instrumentation, Chester (United Kingdom), 15-19 Jul 1991). Order Number DE92004993. Source: OSTI; NTIS; INIS; GPO Dep.

The usefulness of synchrotron radiation sources is not only determined by current, energy and magnetic field but also orbit stability and lifetime. The status and developments at NSLS in storage ring performance are discussed. Efforts at NSLS to look toward the future in source development are presented. In particular, small gap undulator development and studies toward development of UV Free Electron Laser at the Accelerator Test Facility are described. 5 refs., 2 figs., 1 tab.

7373 (JAERI-M–91-155) **The effect of magnetic field shape on undulator radiation spectrum.** Matsuki, Nobuo (JAERI-RIKEN SPring-8 Project Team, Tokyo (Japan)); Sasaki, Shigemi. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1991. 23p. (In Japanese). Order Number DE92751045. Source: OSTI; NTIS (US Sales Only); INIS.

Comparisons of the undulator radiation spectra from various ideal shapes of the on-axis magnetic field strengths in undulator were made. The computations were performed for the 'sinusoidal' shape, the 'triangular' shape, the 'rectangular' shape and the 'power of sinusoidal' shape of magnetic fields. For all cases, 0.3 GeV electron energy, 80 mm magnetic period length and 12 magnetic periods were assumed. The remarkable changes of peak intensities for the third harmonic and the fifth harmonic of undulator radiations were observed. Whereas the fundamental peaks had no remarkable changes. The peak intensities of the 5th harmonics for the triangular and the rectangular shapes of magnetic fields were 1.5 and 0.6 times higher than that for the sinusoidal shape, respectively. Higher peak intensities for higher harmonics of undulator radiation were observed for higher power of sinusoidal shape of magnetic fields. (author).

7374 (KEK–90-21, pp. 49-63) **A review of self-consistent integral equations for the stationary distribution in electron bunches.** Zotter, B. (European Organization for Nuclear Research, Geneva (Switzerland)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1991. (CONF-9009292–: 4. advanced ICFA beam dynamics workshop on collective effects in short bunches, Tokyo (Japan), 22-29 Sep 1990). In *Fourth advanced ICFA beam dynamics workshop on collective effects in short bunches*. 202p. Order Number DE92713858. Source: OSTI; NTIS (US Sales Only); INIS.

Several versions of the self-consistent integral equation for bunch lengthening have been used by various authors. They all derive from the 'Haissinski equation' and differ mainly in the integration limits. Using only causality, it can be shown that all of them are equivalent. We discuss various techniques used to obtain solutions and the calculations of their stability. An explicit analytic solution is possible for the case of a purely resistive impedance, while an inductive impedance leads to an implicit algebraic equation. Approximate solutions are presently being developed also for resonator impedances. The threshold for 'turbulent' bunch lengthening has been obtained from perturbation solutions of the time-dependent Vlasov equation. The values agree with simulation, but appear to be rather large, in particular for very short bunches. (author).

7375 (KEK–90-21, pp. 64-72) **Effects of the potential-well distortion on the longitudinal single-bunch instability.** Oide, Katsunobu (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1991. (CONF-9009292–: 4. advanced ICFA beam dynamics workshop on collective effects in short bunches, Tokyo (Japan), 22-29 Sep 1990). In *Fourth advanced ICFA beam dynamics workshop on collective effects in short bunches.* 202p. Order Number DE92713858. Source: OSTI; NTIS (US Sales Only); INIS.

Effects of the potential-well distortion on the longitudinal single-bunch instability in an electron storage ring are examined. A method which calculates the intensity threshold including the potential well is proposed. As the result, the spectra of the eigenvalues and the threshold of the instability become greatly different from those calculated without the potential-well distortion. (author).

7376 (KEK–90-21, pp. 73-82) **A new type of bunch lengthening.** Hirata, Kohji (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Petracca, S.; Ruggiero, F. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1991. (CONF-9009292–: 4. advanced ICFA beam dynamics workshop on collective effects in short bunches, Tokyo (Japan), 22-29 Sep 1990). Using a constant wake localized at one point in a ring as an example, it is shown how the feature of the bunch lengthening for the highly localized wake is different from that predicted by the conventional theory where the wake force is averaged over one turn. For this example, the space of parameters (strength of the wake force, synchrotron tune and the damping time) is classified into three regions: (1) only a period-one fixed point exists, (2) only a period-two fixed point exists and (3) both types of fixed points can exist (bistable regime). This feature is predicted by a Gaussian model and confirmed by multi-particle tracking. (author).

National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1991. (CONF-9009292–: 4. advanced ICFA beam dynamics workshop on collective effects in short bunches, Tokyo (Japan), 22-29 Sep 1990). In *Fourth advanced ICFA beam dynamics workshop on collective effects in short bunches.* 202p. Order Number DE92713858. Source: OSTI; NTIS (US Sales Only); INIS.

The new device for damping the longitudinal single bunch instability in storage rings is proposed. This simple device is the dielectric canal insert of definite length in vacuum chamber. The structure of wake fields, induced by intensive bunch in such a canal is that, that backward action on bunch particles not only preserves but also decreases bunch length, i.e. leads to bunch selffocusing. The conditions under which this phenomenon reveals itself and can be applied to storage rings are considered. (author).

In storage rings, the bunch length and momentum spread can increase with the intensity. In many cases, such effects are associated with the unstable longitudinal coherent oscillation of the bunch and the related turbulent phenomena. The theoretical and experimental studies of this subject show that depending on the specific conditions, the instability stops when the bunch momentum spread either reaches the value corresponding to the threshold of instability or overshoots it. In this paper, the simplest case when beam and its coherent oscillation evolve near the threshold of negative mass instability is discussed. Besides the mathematical simplification, the results of such calculation can be used as heuristic ones to predict the behavior of very short bunches, when it may be expected that instability rate significantly exceeds the frequency of synchrotron oscillation. From the equation for negative mass instability, the phase trajectory of a particle is determined. The basic properties of the solution and the influence of nonlinear terms are discussed. (K.I.).

7379 (KEK–90-21, pp. 83-89) **Longitudinal transient problems.** Wang, Jiunn-Ming (Brookhaven National Lab., Upton, NY (United States)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1991. (CONF-9009292–: 4. advanced ICFA beam dynamics workshop on collective effects in short bunches, Tokyo (Japan), 22-29 Sep 1990). In *Fourth advanced ICFA beam dynamics workshop on collective effects in short bunches.* 202p. Order Number DE92713858. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper, a simplified method of treating the longitudinal transient problems in a linac or in a storage ring is proposed. The simplification comes about because the Vlasov equation is solved accurately only up to the first order in the frequency slip factor. To this order of approximation, Landau damping is ignored. The longitudinal position of a beam particle is characterized by a variable s. In a linac, s is the distance from the entrance of the linac to where the particle is, and in a storage ring, it is the longitudinal Serret-Frenet coordinate. This variable is treated as the independent variable of the equation of motion. The equation of motion and the Vlasov equation corresponding to the equation of motion are written. For the purpose of investigating the change of the energy spread in a linac or a storage ring, the energy moments are defined. The simplified equation is derived. The longitudinal electric field induced by beam current is given. The simplified equation can be solved easily as an initial value problem for the case of a coasting beam in a storage ring. The well known results describing the longitudinal instability of a small bunch inside a storage ring, Robinson mode, are derived. (K.I.).

The design of Super-ACO foresaw two main modes of operation : high flux (all bunches filled), and temporal structure (one or a few bunches filled). The intensity in the last mode would be limited to about 30 mA per bunch due to the transverse mode coupling instability. In this paper we show that an increase of chromaticity pushes the limit away, keeping the transverse modes well separated. The intensity per bunch can be increased above 165 mA only limited by injection rate and beam lifetime. Consequently, the mode operation for temporal structure 2 bunches with 240 mA suits also to users who need high flux, then time is presently equally shared between the two modes of operation. (author).

Numerous coherent instabilities of bunched beams in storage rings can be associated with the interaction of particles with the low Q-value elements of the vacuum chamber. Traditionally this scope of problems is solved by the calculation of the eigenfrequency spectra for the linearized system of Vlasov's equation. In this report, only the main features of fast transverse coherent single-turn instability and the main stabilizing factors for these oscillations are briefly discussed. For the sake of simplicity, it is assumed that only vertical coherent oscillations are excited in beam. The formula for the unperturbed oscillations of particles is described. The mathematical procedure is explained. The damping of considered instability is discussed. By the detuning of head-on and tail-on particles, the oscillations can be damped. The action of beam cooling and Landau damping on fast coherent oscillations is considered. The BNS damping is discussed. The simple calculation of the BNS damping can be done. It sufficiently uses the resonant nature of instability, and assumes suppression by the introduction of the deviation of particle oscillation frequency along a bunch. (K.I.).

7383 (KEK–91-5) **Report from 'Orbit sub-group' of task force for MR synchrotron radiation project.** Kobayashi, M. (ed.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jul 1991. 133p. (In Japanese). Order Number DE92751024. Source: OSTI; NTIS (US Sales Only); INIS.

This report includes feasibility studies for a new synchrotron radiation source using TRISTAN Main Ring (MR) of KEK now being used as an electron and positron collider. A task force for the feasibility study started in the spring of 1990, and a sub-group was organized to study and discuss the problems related to the lattice of MR. The main subject in this report is how to realize both very small emittance and large dynamic aperture in a new lattice. Two long straight sections in the present lattice called 'Nikko' and 'Oho' must be modified like a gable roof, 1) to get free space for insertion devices, 2) to extract their synchrotron radiation to the experimental hutches which will be set in the ring tunnel in those sections and 3) to add a radiation shielding wall between the ring and the beam channel for the synchrotron radiation. The other two long straight sections called 'Fuji' and 'Tsukuba' will be used for injection, RF cavities and damping wigglers necessary for the very low emittance. The ultimate emittance will be 1.6 nm rad with the horizontal dynamic aperture of 36 x 10^{-6} m rad that is about half the aperture experienced at the present MR. (author).

7384 (KEK–91-7) **Reinforcement of the high-power RF source at the Photon Factory storage ring.** Sakanaka, S.; Izawa, M.; Kobayakawa, H.; Tokumoto, S.; Kiuchi, T. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1991. 65p. Order Number DE92751026. Source: OSTI; NTIS (US Sales Only); INIS.

Four single-cell cavities are used for beam acceleration in the Photon Factory storage ring. An RF power was supplied by two 180-kW klystrons until July, 1988. The maximum stored current of the ring was 370 mA, limited by the available RF-power. In order to store more high-current beams, the RF-power source was reinforced by an addition of two klystrons in 1988. Hence, each cavity is driven by a single klystron. Related devices such as a high-voltage power supply for the klystron, a circulator, waveguides and low-level RF circuits were newly installed. The reinforcement allowed us to achieve a stored current of 500 mA at 2.5 GeV. (author).

7385 (LBL–30457) **Diagnostic beam line for a third generation storage ring.** Perera, R.C.C.; Melczer, M.E.; Warwick, A.; Jackson, A.; Kincaid, B.M. Lawrence Berkeley Lab., CA (United States). 15 May 1991. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE92003969. Source: OSTI; NTIS; GPO Dep.

A knowledge of the position, size, and stability of the source and the angle of emission of synchrotron radiation (SR) from the storage ring are essential for optimizing the operation of storage ring, insertion device and monochromators. Berkeley's Advanced Light Source (ALS) has a natural emittance of 3.4 x 10^{-9} m-rad, and has beam sizes σ_h and σ_v (assuming a 10% emittance ratio into the vertical direction) in bending magnet 1 (BM1) of 44 μm and 83 μm respectively. Simple diffractive optical calculations show that imaging this beam using visible light optics is not feasible and imaging must be performed using photon energies greater than 50 eV. This will be the same for all third generation low emittance storage rings. The synchrotron radiation diagnostics at ALS will consist of an imaging system for 200 eV photons and a "white beam" port with a streak camera to obtain the timing information. The imaging system will employ two crossed spherical mirrors in a Kirkpatrick-Baez configuration, to eliminate astigmatism. Use of 1:1 imaging will eliminate coma, resulting in an image of the source which is only limited by the residual aberrations of the optics. Real time imaging of the beam is deemed feasible by the use of a high resolution CCD, and the associated electronics necessary to read the CCD. The design of the imaging system of the diagnostic beam line for ALS and the detection system will be discussed with a view toward applications in other third generation SR sources. 6 refs.

7386 (LBL–31434) **Beam-beam dynamics during the injection process at the PEP-II B-Factory.** Chin, Yong Ho. Lawrence Berkeley Lab., CA (United States). Oct 1991. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE92004097. Source: OSTI; NTIS; INIS; GPO Dep.

This paper is concerned with beam-beam effects during the injection process at the proposed asymmetric SLAC/LBL/LLNL B-Factory based on PEP (PEP-2). For symmetric colliders, the primary source of the beam-beam effect is the head-on collision at the interaction point (IP), and this effect can be mitigated by separating the beams during the injection process. For an asymmetric collider, which intrinsically consists of two separate rings, the bunches not only collide at the IP but experience a long-range beam-beam force on the way into and out of the IP region. These collisions are called "parasitic crossings (PC)." The parasitic crossings emerge as a potential source of far stronger beam-beam impact during the injection process for the following reason. In the proposed injection scheme of the APIARY-6.3d design, the bunches are injected horizontally into the two rings with large horizontal offset of $8\sigma_{Ox}{}^{sptm}$ where $\sigma_{Ox}{}^{sptm}$ is the nominal horizontal storage ring beam size at the end of the septum magnet. Then, the injected beam starts to travel around the ring oscillating horizontally. For the sake of discussion, let us assume that the beam in the other ring has already been fully stored. When the injected beam arrives at the 1st PC, where the two nominal orbits are separated horizontally by about 7.6 times the nominal horizontal beam size of the low energy ring, it may pass through the other beam far more closely than at the nominal separation distance, or it may even strike the other beam head-on.

44 INSTRUMENTATION

7387 (ORNL–6635/V2) **Instrumentation and Controls Division progress report for the period July 1, 1988 to June 30, 1990: Volume 2.** Klobe, L.E. (ed.). Oak Ridge National Lab., TN (United States). Dec 1990. 56p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE92004584. Source: OSTI; NTIS; INIS; GPO Dep.

The format of this Instrumentation and Controls Division progress report is a major departure from previous reports. This report has been published in two volumes instead of one, and the description of individual activities have been shortened considerably to make it easier document to scan and to read. Volume 1 of this report presents brief descriptions of a few highly significant programmatic and technological efforts representative of Instrumentation and Controls Division activities over the past two years. This volume contains information concerning the publications, presentations, and other professional activities and achievements of I&C Division staff members.

7388 (ANL/CP–74511) **New radiation hodoscope developments for Arms Control Treaty verification.** Dickerman, C.E.; Doerner, R.C.; Regis, J.P.; Rhodes, E.A.; Stanford, G.S.; Travis, D.J.; DeVolpi, A. Argonne National Lab., IL (United States). [1991]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-31109-ENG-38. (CONF-911106–15: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92003391. Source: OSTI; NTIS; GPO Dep.

New developments in hodoscope radiation detection technology offer a wide range of unique capabilities for arms control treaty verification (ACTV) applications. Originally developed for civilian nuclear power research by Argonne National Laboratory, this concept uses an array of radiation detectors to image or detect objects inside opaque containments. Hodoscope systems may detect neutrons and/or gamma-rays. The systems may be based on transmission of radiation through the objects; may detect radiation stimulated in the objects, or may detect intrinsic object radiation. ACTV hodoscopes do not require the high-speed data acquisition systems or the heavy shielding and collimation of reactor hodoscopes, and relatively weak radiation sources are sufficient. We have performed laboratory measurements to demonstrate a range of potential applications. Gamma-ray transmission hodoscopes can be used to inspect canisters, rail cars, etc. to monitor objects such as rocket motors. The use of relatively weak radiation sources makes it unnecessary to employ expensive and high-intensity accelerators. The heavy metal of nuclear warheads is characterized by strong gamma-ray absorption, and these materials could be counted by low-resolution tomography. Absorbers located in line with objects will themselves be detected, and sources located in the object region will be subtracted out as background. Intrinsic gamma-ray radiation from warheads also can be detected in a passive-instrument mode. Neutron hodoscopes can utilize neutron transmission, intrinsic neutron emission, or neutron-producing reactions (either prompt or delayed) stimulated by a neutron source. Monitoring of rocket motors enclosed in canisters/rail cars is the focus of the most recent ACTV hodoscope research and development activities. 3 refs., 5 figs., 2 tabs.

7389 (ANL/CP–74572) **Associated-particle sealed-tube neutron generators and hodoscopes for NDA applications.** Rhodes, E. (Argonne National Lab., IL (United States)); Peters, C.W. Argonne National Lab., IL (United States). [1991]. 23p. Sponsored by U.S. DOE Defense Programs; U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract W-31109-ENG-38. (CONF-9111125–1: 20. Japan conference on radiation and radioisotopes, Tokyo (Japan), 12-14 Nov 1991). Order Number DE92003423. Source: OSTI; NTIS; INIS; GPO Dep.

With radioisotope sources, gamma-ray transmission hodoscopes can inspect canisters and railcars to monitor rocket motors, can detect nuclear warheads by their characteristic strong gamma-ray absorption, or can count nuclear warheads inside a missile by low-resolution tomography. Intrinsic gamma-ray radiation from warheads can also be detected in a passive mode. Neutron hodoscopes can use neutron transmission, intrinsic neutron emission, or reactions stimulated by a neutron source, in treaty verification roles. Gamma-ray and neutron hodoscopes can be combined with a recently developed neutron diagnostic probe system, based on a unique associated-particle sealed-tube neutron generator (APSTNG) that interrogates the object of interest with a low-intensity beam of 14-MeV neutrons, and that uses flight-time to electronically collimate transmitted neutrons and to tomographically image nuclides identified by reaction gamma-rays. Gamma-ray spectra of resulting neutron reactions identify nuclides associated with all major chemicals in chemical warfare agents, explosives, and drugs, as well as many pollutants and fissile and fertile special nuclear material. 5 refs., 12 figs.

7390 (ANL/CP–74584) **Self-recovering superconducting strip detectors.** Gabutti, A.; Gray, K.E. Argonne National Lab., IL (United States). Sep 1991. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9109317–1: 4. international workshop on low temperature detectors and dark matter, Oxford (United Kingdom), 4-7 Sep 1991). Order Number DE92004148. Source: OSTI; NTIS; INIS; GPO Dep.

Using a 1.8 μm wide superconducting strip made of granular tungsten, we have observed self-recovering pulses when the detector is irradiated with a ^{55}Fe 6 keV X-rays source. For low values of the bias current (i.e. $I_b<30\mu A$ at $T_b=1.5K$) the superconducting state is recovered in 10–50 ns giving voltage pulses across the strip of few hundred μv in amplitude. At high bias currents the detector did not self-recover and a constant counting efficiency has measured at different operating temperatures. There are good indications that this high counting rate can be extended to all the reduced bias currents where the detector is able to reset itself after every switch. The current threshold between collapsing and propagating switches and the time evolution of the voltage pulses can be described using a thermal propagation model developed in previous works. The ability of detectors to automatically recover the superconducting state in a short period of time after sensing a particle is encouraging in the feasibility study of fast superconducting microvertex detectors and also confirm the potential application of superconducting strips as high fast resolution X-rays detectors.

7391 (ANL-HEP-TR–91/100) **Some physics requirements for triggering in the intermediate tracking system of SDC.** Trost, H.J. Argonne National Lab., IL (United States). High Energy Physics Div. 22 Nov 1991. 30p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE92005226. Source: OSTI; NTIS; INIS; GPO Dep.

I have investigated trigger requirements for the intermediate tracking system of the SDC detector, using muons in the final states of some physics processes of interest and relevance to the program envisaged to be pursued at the SSC. The study is done at the physics event generator level with the PYTHIA package, augmented by a very simplistic simulation of the momentum measurement expected from the intermediate tracking system. For the range in pseudorapidity of $|\eta|$ = 1.7–2.5, I find a subdivision into four basic bins sufficient to ensure that the width of the transverse momentum trigger threshold will not be dominated by the lack of knowledge of the polar angle. In addition, the azimuthal resolution has be better than 1 mrad to allow transverse momentum thresholds from $p_t\approx10$ GeV/c up to and beyond $p_t=20$ GeV/c to be implemented which are needed to accomplish the physics goals. 10 figs., 1 tab.

7392 (BONN-IR–90-31) **Driving of the laser beam in the calibration system of the jet chamber of the OPAL detector.** Neumann, H. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Jun 1990. 54p. (In German). Order Number DE92759284. Source: OSTI; NTIS (US Sales Only); INIS.

The OPAL jet chamer is calibrated by means of UV-Laser beams. A complex optical system containing 226 mirrors has been set up to guide the beams into the chamber. The distance between Laser and chamber is about 16 m and the beams have to be positioned in the chamber with an accuracy better than 0.5 mm. The beam position is measured by 96 Lateral Effect Diodes with a spatial resolution of about 80 μm and controlled by microcomputer systems (VME) which steer 4 movable mirrors with a precision of 5 μm. A control program has been tested first with a simulation of the Laser calibration system. It operates successfully since LEP start. Stability has been investigated - especially the independence of the control program on critical mechanical parameters. (orig.).

7393 (BONN-IR–91-12) **Search for possible geometrical deformations of the anode planes of the OPAL jet chamber.** Bug, S. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Feb 1991. 72p. (In German). Order Number DE92758860. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of geometrical deformations of the anode planes of the OPAL jet chamber has been investigated. Using an UV laser beam, which passes through the chamber under various well-known angles Θ wrt the symmetry axis, possible deformations can be determined from studies of the track sagittae as function of the angle Θ. A small torsion of the detector end cones has been found, resulting in a displacement at outer radii of about 100 μm. The deformations of the suspensions of the anode wires are smaller than about 20-30 μm. The extra error of the transverse momentum due to geometrical deformations is $\sigma P_t/P_t \simeq 3\%$ for momenta of 45 GeV/c and a magnetic field of 4.35 kG. (orig.).

7394 (BONN-IR–91-23) **The uranium calorimeter of the ZEUS detector - studies on the uniformity of the energy measurement of electrons.** Prange, K. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Apr 1991. 45p. (In German). Order Number DE92758861. Source: OSTI; NTIS (US Sales Only); INIS.

To meet the physics goals at the ep-collider HERA, the compensating uranium scintillator sandwich calorimeter for the ZEUS-Detector has an energy resolution $\sigma/E = 35\%/\sqrt{E} + \sigma_{cal}$; the total calibration error σ_{cal} including overall spatial nonuniformity should be less than 2%. Inhomogeneities occur at the edges of scintillator readout segments. They influence the spatial uniformity of the response of EMC-sections within a calorimeter module as well as between adjacent modules. Both items have been investigated in beam measurements with a spatial granularity of about 1 mm. The nonuniformity for electrons due to the EMC-segmentation within a calolrimeter module is less than 8.3%. That effect is observed in a region of ±4 mm [FWHM] for perpendicular electron incidence. The inhomogeneity at the transition of two modules is compensated by a lead foil of 2.6 mm. Investigations with the prototype calorimeter show the effect on average energy measurement for the ZEUS geometry to be below 2%. (orig.).

7395 (BONN-IR–91-24) **Construction of a test facility for the readout electronics of the ZEUS calorimeter.** Geitz, G. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. May 1991. 77p. (In German). Order Number DE92758862. Source: OSTI; NTIS (US Sales Only); INIS.

The Uranium-Scintillator Calorimeter for the ZEUS Detector at HERA is read out by pulse-shaping front-end electronics which take samples on the stretched photomultiplier pulses and store them as analog voltages. After each trigger decision, the data is then digitized. By equalizing the calorimeter response to hadrons and electrons of the same energy and by minimisation of systematic errors a hadronic resolution of $\sigma_E/E = 35\%/\sqrt{(E/GEV)} + 2\%$ is achieved. To ensure a calibration of the calorimeter to better than 2%, an electronics calibartion has to be done for each readout channel which corrects for inequalities and sets the energy scale. A test facility designed to carry out series measurements and special investigations on the analog electronics has been built. A description of this facility and of the first measurements made with it are given. (orig.).

7396 (BONN-IR–91-25) **Calibration of the electromagnetic part of the ZEUS calorimeter with electrons.** Bargende, A. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. May 1991. 42p. (In German). Order Number DE92759275. Source: OSTI; NTIS (US Sales Only); INIS.

Ten modules of the Uranium-Scintillator-Calorimeter for ZEUS were exposed to the X5-beam at CERN. The momentum of the beam is determined with an accuracy of better than 1.1%. From measurements with electrons in the energy range of 10 to 110 GeV we obtain the following results. The energy resolution is found to be better than $18\% /\sqrt{E/GeV}$. A worse resolution measured in the HACO-towers is explained by averaging effects over the beam size. The uranium noise provides an intercalibration of the calorimeter sections within 1.1% for electron signals in the FCAL (1.5% in RCAL). The linearity of the FCAL is better than 0.5%. Nonlinearities of 2% in the RCAL are mainly caused by the photomultipliers. (orig.).

7397 (BONN-IR–91-37) **Changing of the ELAN data acquisition to an integrated system with VME frontend acquisition and VAX work station analysis.** Foerster, W. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Jul 1991. 61p. (In German). Order Number DE92758858. Source: OSTI; NTIS (US Sales Only); INIS.

A new data acquisition system for the experiment ELAN at the electron stretcher accelerator ELSA had become necessary due to changes in the experimental setup. The data acquisition and analysis which formerly both were performed by a single computer system are now separately done by a VMEbus-Computer and a VAX-Workstation. Based on the software components MECDAS (Mainz Experiment Control and Data Acquisition System) and GOOSY (GSI Online Offline System) a powerfull tool for data acquisition and analysis has been adapted to the requirements of the ELAN experiment. (orig.).

7398 (BONN-IR–91-38) **The LED monitoring system of the PHOENICS experiment.** Urban, D. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Jul 1991. 52p. (In German). Order Number DE92758857. Source: OSTI; NTIS (US Sales Only); INIS.

The PHOENICS experiment at ELSA uses a LED monitoring system to control pulse height and time measurement with scintillation counters. A green LED is mounted at the light guide of each of the 304 involved photomultiplier tubes. The LEDs are driven by fast voltage pulses of 5 ns FWHM width and about 20 V amplitude. Simulation of single events is possible by computer controlled switching of individual LEDs. In order to correct for the temperature dependence of the LED intensity an automatic temperature recording system was coupled to the computer. This monitor system allows to control the pulse height and time measurement with an accuracy of about 2% and 100 ps respectively. (orig.).

7399 (BONN-IR–91-39) **Procedure for monitoring and calibration of the photon detection system of the SAPHIR spectrometer.** Guse, B. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Jul 1991. 93p. (In German). Order Number DE92758914. Source: OSTI; NTIS (US Sales Only); INIS.

The SAPHIR detector at the ELSA storage ring of the Physics Institute of Bonn University is designed to measure multi-particle final states. The momenta of the charged particles are measured by a drift chamber system. Different types of particles are identified by their time of flight using a scintillation counter system. Photons are detected by a large area (16 m^2 in forward direction) shower counter arrangement. The shower counter system consisting of 98 modules is a metal-gas sandwich type which combines a good energy resolution (13.5% $1/\sqrt{E[GeV]}$) with a good spatial resolution (13 mm at 1 GeV). This paper describes the monitor system which has been built to measure and control the gas gain. Different methods are discussed. The gain is stabilized by using a system of small proportional tubes having the same geometry as those to be stabilized. These tubes are irradiated through a thin window by an ^{55}Fe source. The spectra are analysed by a computer program which detects gain drifts and compensates them by controlling the HV accordingly. A second measurement of the gas gain is performed using cosmic muons. Combining these two methods a stabilization of the detector pulse height better than 3% could be achieved. Cosmic muons have also been used to calibrate the single modules relative to each other. The last part of the paper describes a first absolute calibration of the shower counter system done in two different ways. First the e^+e^- pairs were used to calibrate the modules in the middle plain of the calorimeter. The second method exploited the decay photons of neutral pions. Both methods were found to yield consistent results. (orig.).

7400 (BONN-IR–91-43) **The data acquisition system PHON for the detectors of the PHOENICS experiment.** Schneider, W. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Jul 1991. 70p. (In German). Order Number DE92759278. Source: OSTI; NTIS (US Sales Only); INIS.

The PHON data acquisition system for the PHOENICS experiment at the stretcher ring ELSA in Bonn and its development is described. PHON is based on a fast parallel CAMAC readout with VME front-end processors and a VAX/VMS computer, allowing c omfortable control and programming. The current configuration of the PHON system at the PHOENICS detector uses two CAMAC branches that are read out in parallel. The data is transferred to the VAX by either the ethernet (max. rate 100 kByte/sec) or a bus coupler device (max. rate 650 kByte/sec). On the VAX the data can be stored on a harddisk and analyzed by several PHON online tasks. The harddisk limits the maximum data rate to a value of approximately 180 kByte/sec. The maximum trigger rate achieved is about 150 Hz. Two kinds of user shells are realized to control the PHON system. A command shell follows the standard of the control language of the VMS operating system and a graphic user interface uses the 'X Window System'. The modular structure of the PHON system and the unique kind of creation of all PHON programs makes a further development of the system easy to do. (orig.).

7401 (BONN-IR--91-47) **Studies on the space-drift time relation in the inhomogeneous magnetic field in the planar drift chambers of the ZEUS detector.** Kirch, U. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Aug 1991. 160p. (In German). Order Number DE92759282. Source: OSTI; NTIS (US Sales Only); INIS.

The ZEUS-detector at the electron-proton-collider HERA at DESY in Hamburg contains planar drift chambers (FTDs and RTD) in the proton forward and rear direction. These particle tracking devices will operate in a strong and highly inhomogeneous magnetic field (gradient up to 3 T/m), because they are located at both ends of the coil of the superconducting solenoid. The space drifttime relation (SDR) depends significantly on the relative configuration of the magnetic and electric field, i.e. it depends on the position of a track inside the chambers and on its angle of incidence. In this paper we study symmetries of the SDR throughout the chambers. We give a detailed description of the magnetic field measurements in the inner tracking region of the ZEUS-detector. We numerically study the effects of magnetic field measurement uncertainties on the SDR. In order to exploit the full spatial resolution of 100 μm, we need to know the field with an accuracy of 0.005 T in the regions of FTD1 and RTD and with 0.01 T in the regioins of FTD2 and FTD3. Finally we study a three dimensional parametrization of the SDR. We obtain a parametrization fullfilling the required criteria of accuracy, which allows a fast computation of the drift time as a function of the three basic parameters: the position of a track along the wire, the distance to the wire and the angle of incidence. (orig.).

7402 (BONN-IR--91-50) **Determination of the detection probability of neutron counters.** Harpes, N. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. 22 Jul 1991. 56p. (In German). Order Number DE92759277. Source: OSTI; NTIS (US Sales Only); INIS.

At the PHOENICS experiment neutron detection is done by scintillation counters consisting of 100x20x20 cm^3 NE110 or Nuplex3 bars with photomultiplier tubes mounted on both ends. Calibration measurements to determine the neutron detection efficiency have been done for 4 counters at the LNS (Laboratoire National Saturne, Saclay, France). The method to obtain neutrons of well-defined energy and angle was neutron-tagging in elastic np-scattering off a CH_2-target. The efficiency was measured at different impact positions and for up to five neutron energies between 20 and 175 MeV. The efficiency shows a strong energy dependence for low energies and becomes rather constant (ca. 20%) at higher energies. The detection thresholds were varied between 1.1 and 15 MeV. Especially for low energies, the detection efficiency depends strongly on the threshold. The results of Monte Carlo simulation are in good agreement with the measurements. (orig.).

7403 (BONN-IR--91-51) **Principal components analysis and polynomials as methods for the track extrapolation/interpolation for SAPHIR.** Juengst, H.G. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Apr 1991. 92p. (In German). Order Number DE92759280. Source: OSTI; NTIS (US Sales Only); INIS.

A program to investigate the possibility of track extrapolation and interpolation for drift chambers with the Principal Components Analysis and polynoms was written for SAPHIR. The results for the most significant configurations at SAPHIR were pointed out. It was shown that the Principal Components Analysis is a good basis to write a fast track reconstruction program for a drift chamber using a global track model in an inhomogeneous magnetic field. A data input/output package was written, too. (orig.).

7404 (BONN-IR--91-53) **Studies on the intercalibration as well as construction and test of a gas-flow monitoring facility of the SAPHIR shower detector.** Ritz, B. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Sep 1991. 69p. (In German). Order Number DE92759281. Source: OSTI; NTIS (US Sales Only); INIS.

At the SAPHIR detector a large electromagnetic calorimeter has been built to detect photons in forward direction. This photon detection system consists of 98 identical gas sampling calorimeters with signal wires perpendicular to the converters. For a single calorimeter module an energy resoltuion of $\sigma(E)/E^{*}\sqrt{E(GeV)}$ = 13.6% was achieved. Measurements to determine the relative calibration factors of the calorimeter channels have been made. To examine the influence of saturation effects on these factors, data of ionisation tracks directed parallel and perpendicular to the signal wires have been taken. The MOP algorithm is discussed as a possible method of finding a relevant physical quantity for the calculation of the calibration factors. The results of both measurements are compared. The second part of this paper describes the arrangement of the gas flow control of the photon detection system at SAPHIR. Each of nine gas flows can be selected by a special developed gas switch and is conducted to a thermic mass flow meter. There are 11 such gas switches. A computer takes control over the selection and the periodic measurements. The data are available at any time and give the experimentalist reliable information on the gas flow of all 98 calorimeter moduls. (orig.).

7405 (BONN-IR--91-59) **Construction and test of an apparatus for the measurement of the photon-definition probability at the SAPHIR experiment.** Hannappel, J. Bonn Univ. (Germany). Physikalisches Inst.; Bonn Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Oct 1991. 43p. (In German). Order Number DE92759317. Source: OSTI; NTIS (US Sales Only); INIS.

An apparatus for the measurement of the tagging efficiency P_γ for use with the SAPHIR-detector was built and tested together with it's readout and analysis software. Preliminary results show that a P_γ of 70% can be reached over the total tagged energy range, varying far more between adjacent channels than over the total energy range. Also some software was written to measure profiles of the electron and the photon beam at the SAPHIR-experiment. (orig.).

7406 (CNIC--00428) **Si(Li) X-ray detector.** Yuan Xianglin (Beijing Nuclear Instrument Factory, BJ (China)); Li Zhiyong; Hong Xiuse. China Nuclear Information Centre, Beijing, BJ (China). Aug 1990. 6p. (In Chinese). (BNIF--0004.). Order Number DE92613846. Source: OSTI; NTIS (US Sales Only); INIS.

The fabrication technology of the 10≈80 mm^2 Si(Li) X-ray detectors are described and some problems concerning technology and measurement are discussed. The specifications of the detectors are shown as well. The Si(Li) X-ray detector is a kind of low energy X-ray detectors. Owing to very high energy resolution, fine linearity and high detection efficiency in the range of low energy X-rays, it is widely used in the fields of nuclear physics, medicine, geology and environmental protection, etc,. It is also a kernel component for the scanning electron microscope and X-ray fluorescence analysis systems.

7407 (CONF-911107--49) **The Pulsed Interrogation Neutron and Gamma (PING) inspection system.** Schultz, F.J. (Oak Ridge National Lab., TN (United States)); Hensley, D.C.; Coffey, D.E.; Chapman, J.A.; Caylor, B.A.; Bailey, R.D.; Vourvopoulos, G.; Kehayias, J. Oak Ridge National Lab., TN (United States). [1991].

22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society (ANS); San Francisco, CA (United States); 10-15 Nov 1991. Order Number DE92004401. Source: OSTI; NTIS; GPO Dep.

Explosives and chemical warfare (CW) agents possess elements and characteristic elemental ratios not commonly found in significant quantities in other items. These elements include nitrogen, oxygen, fluorine, phosphorus, sulfur, and chlorine. The research described herein discusses the results to date of the development of a pulsed-neutron interrogation and gamma (γ)-ray system for detecting concealed explosives and for discriminating munitions containing CW agents and conventional explosives. Preliminary experimental data has suggested that distinct classes of chemical agents could also be distinguished, for example, nerve agents and mustard gases. Based on there results, the system is currently being designed for the detection of explosives concealed, for example, in airline luggage. Nuclear and x-ray technologies possess unique characteristics to quickly and reliably search for explosives. Both oxygen and nitrogen, present in sufficient concentrations, when detected, uniquely determine the presence of explosives. Carbon would be a third element that is common in all explosives, although it does not correlate uniquely with all known explosives. A system which identifies and quantifies all three elements would provide more reliable information about the interrogated material. We have previously demonstrated that the technique described in this paper can identify certain elements through fast- and slow-neutron interrogation and subsequent prompt- and delayed-γ-ray detection. The identification of CW agent elements such as chlorine, phosphorus, sulfur, and fluorine, is also accomplished through the detection of characteristic capture γ-rays. The Pulsed Interrogation Neutron and Gamma (PING) inspection system is based upon technology developed over twelve years for the determination of fissile mass quantities in radioactive waste, for the determination of sulfur in coal, and for in-vivo body composition measurements.

7408 (CONF-9105106–35) **DUMAND-II progress report.** Wilkes, R.J. DUMAND Collaboration. Washington Univ., Seattle, WA (United States). Visual Techniques Lab. [1991]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-91ER40614. (UWSEA-PUB–91-09). From Conference on the intersections between particle and nuclear physics; Tucson, AZ (United States); 23-29 May 1991. Order Number DE92004380. Source: OSTI; NTIS; INIS; GPO Dep.

The design, scientific goals, and capabilities of the DUMAND II detector system are described. Construction was authorized by DOE in 1990, and development of various detector subsystems is under way. Current plans include deployment of the shore cable, junction box and three strings of optical detector modules in 1992, with expansion to the full 9-string configuration about one year later.

7409 (CTH-RF–86) **The development of a spectrometer for 14 MeV neutrons from fusion.** Aronsson, D. Chalmers Univ. of Tech., Goeteborg (Sweden). Dept. of Reactor Physics. 1991. 40p. Order Number DE92615123. Source: OSTI; NTIS (US Sales Only); INIS.

A spectrometer for 14 MeV neutrons, to be used for fusion plasma diagnostics at JET, was developed. The spectrometer utilizes neutron scattering in a polyethylene foil with the detection of the scattered neutron and its associated recoil proton. For the detection of 12 MeV protons we have tested silicon surface barrier detectors, lithium-drifted silicon detectors and high purity germanium detectors. The lithium-drifted detectors were finally selected for use in the spectrometer. The lithium-drifted silicon diodes have also been used for direct spectrometry, utilizing the neutron induced charged particle reactions in silicon. The methods used for the energy calibration and the timing calibration of the diodes, both during the installation of the spectrometer and during operation, are described. The detection of 2 MeV neutrons is done by fast plastic scintillators. Since the neutron generator which was used to test the detectors supplies 14 MeV or 2.5 MeV neutrons only, a neutron energy converter has to be constructed to study the detectors at other neutron energies. In the actual spectrometer an array of scintillation neutron detectors is used. A method of calibrating such an array of detectors with a gamma source was elaborated and is also described here. The result of the calibration is a set of parameters than can be used to determine the high voltage settings and the discriminator levels that are needed to achieve homogeneous sensitivity for all the detectors of the array. The energy scale itself was then calibrated by using gamma sources of various energies. To test the spectrometer as a whole at a neutron generator, a test bed was constructed. A lithium-drifted silicon diode was used to measure the neutron flux and the neutron energy resolution in the test bed. (au).

7410 (DESY–91-083) **Plastic scintillators in magnetic fields.** Bloemker, D. (Hamburg Univ. (Germany). 1. Inst. fuer Experimentalphysik); Holm, U.; Klanner, R.; Krebs, B. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jul 1991. 22p. Order Number DE92758918. Source: OSTI; NTIS (US Sales Only); INIS.

The dependence of the light yield and the transmission on magnetic field has been measured with different methods up to 0.45 T for the plastic scintillators NE-102A, SCSN-38, and Polivar. The scintillators were excited by 25 MeV protons, 5.9 keV X-rays and UV light. When excited with ionizing radiation an increase of light yield is observed. For SCSN-38 of 2.6 mm thickness it amounts to 0.3%, 0.9%, 1.1% and 3.3% at 1, 10, 100 and 450 mT, respectively. NE-102A behaves similar, whereas an acrylic scintillator shows a stronger field dependence. The effect is independent of the direction of the field but increases for the Polivar scintillator with its thickness. No change in the decay time of the scintillator has been observed. The response of the scintillators did not change when excited by UV light in a magnetic field. (orig.).

7411 (DOE/ER/10699–T10) **[Calorimeter based detectors for high energy hadron colliders]: [Progress report].** State Univ. of New York, Stony Brook, NY (United States). Dept. of Physics. [1991]. 57p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-80ER10699. Order Number DE92004331. Source: OSTI; NTIS; GPO Dep.

This report discusses the DO experiment; Central Tracking; Calorimetry; Test Beam studies; Analysis Efforts; Upgrading the DO Detector; The EMPACT/TEXAS and R&D; SSC Detector R&D; and SSC Detector Prospects.

7412 (DOE/ER/40257–6) **Non-accelerator particle physics: Final report, February 1, 1986–April 30, 1991.** Steinberg, R.I.; Lane, C.E. Drexel Univ., Philadelphia, PA (United States). Dept. of Physics. Aug 1991. 92p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-86ER40257. Order Number DE92004833. Source: OSTI; NTIS; INIS; GPO Dep.

The goals of this research were the experimental testing of fundamental theories of physics such as grand unification and the exploration of cosmic phenomena through the techniques of particle physics. We have worked on the MACRO experiment, which is employing a large area underground detector to search for grand unification magnetic monopoles and dark matter candidates and to study cosmic ray muons as well as low and high energy neutrinos; the νIMB project, which seeks to refurbish and upgrade the IMB water Cerenkov detector to perform an improved proton decay search together with a long baseline reactor neutrino oscillation experiments using a one kiloton liquid scintillator (the Perry experiment); and development of technology for improved liquid scintillators and for very low background materials in support of the MACRO and Perry experiments and for new solar neutrino experiments.

7413 (DOE/ER/40513–1) **Vectorization of GEANT for generic detector research and event simulation: Final report.** Martin, W.R. (Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering); Wilderman, S.J.; Ball, R.C. Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering. Mar 1991. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-89ER40513. Order Number DE92004023. Source: OSTI; NTIS; INIS; GPO Dep.

The Monte Carlo method for particle transport simulation is an essential tool in both the design process and the analytical evaluation process for detectors in the current and coming generation of high energy physics (HEP) experiments. Currently, the GEANT [1] Monte Carlo shower simulation code is the primary research tool being used in modeling all aspects of particle transport in HEP detectors. As with most Monte Carlo programs, the effectiveness and range of applicability of GEANT is limited primarily by the excessive run time required to provide statistically reliable results. Since the number of tracks which must be simulated, and hence the computational effort required, increase dramatically as higher energy events are modeled, the need for increased computational speed will become more urgent as the HEP community continues to explore physics at ever increasing energies. Part of this need may be met by efficient utilization of the existing capabilities of current vector supercomputers, such as the Cray YMP/48 and the IBM 3090. Using such resources effectively with Monte Carlo programs involves alteration of the program from a scalar history based algorithm to a vectorized event based algorithm. Results of a preliminary evaluation of the suitability of GEANT for adaptation to a fully vectorizable event based algorithm are presented here. 22 refs., 5 figs.

7415 (DOE/OR/00033–T464) **Producing a known neutral particle beam for the purpose of calibrating a neutral particle detector.** Lindley, R.A. Illinois Univ., Urbana, IL (United States). Dept. of Nuclear Engineering. 15 Aug 1989. 56p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-76OR00033. Order Number DE92004538. Source: OSTI; NTIS; INIS; GPO Dep.

On Earth, gravitational confinement of a plasma is not possible, so plasmas are studied in vacuum chambers where the confinement of the plasma consists mainly of the chamber walls and magnetic fields. Here, the interaction of the plasma with the walls around it is unavoidably significant. The energetic ions and electrons of the plasma strike the walls and a number of different particles leave the surface, most of which are electrically neutral. Sometimes, plasma-surface interactions are beneficial such an in plasma processing. In other cases, the plasma-surface interaction is a hindrance such as in magnetic fusion systems. In either case, it is important to study plasma-surface interactions in order to predict and control its effect on the experimental system. In an effort to understand the composition of the particles leaving the surface, Ph.D. candidate Bruce Cain and Associate Professor David Ruzjc at the University of Illinois have designed and built a system to examine the neutral particles scattered from light ions hitting a surface with a beam energy of 10 to 900 eV. According to the design of the system, the neutral particles are ionized by a glow discharge ionizer and then enter into an energy analyzer. In order to calibrate the ionizer and the energy analyzer, a known particle beam is made by a charge exchange cell that is placed in the path of an ion beam. The design and use of the charge exchange cell is the subject of this paper, which will present the underlying theory, followed by the experimental design, and finally the procedures and the results of the experiments undertaken.

7416 (EGG–10617-2103) **The effect of charge trapping on the spectrometric performance of HgI_2 gamma detectors.** Iwanczyk, J.S. (Xsirius, Inc., Marina Del Rey, CA (United States)); Schnepple, W.F.; Masterson, M.J. EG and G Energy Measurements, Inc., Goleta, CA (United States). 15 Oct 1991. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-88NV10617. (CONF-9109209–3: 7. international workshop on room temperature - semiconductor X-ray and gamma-ray detectors and associated electronics, Ravello (Italy), 23-28 Sep 1991). Order Number DE92003688. Source: OSTI; NTIS; INIS; GPO Dep.

The paper presents a theoretical model to describe the charge collection process for HgI_2 gamma detectors. The standard deviations of full energy peak distributions are shown as a function of mean drift lengths of electron and holes. Calculated spectra shape changes versus variation in the internal detector electrical field distribution are studied. Simulated spectra are compared wit experimental data. The model assumptions and results are discussed. 18 refs., 4 figs.

7417 (FNAL/C–91/205) **Three-dimensional field map of the Fermilab D0 detector.** Ostiguy, J.; Yamada, R. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1991. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-910505–428: 1991 Institute of Electrical and Electronics Engineers (IEEE) particle accelerator conference (PAC), San Francisco, CA (United States), 6-11 May 1991). Order Number DE92004804. Source: OSTI; NTIS; INIS; GPO Dep.

The D0 detector is a general purpose hadron collider detector presently under construction at Fermilab and scheduled to be put in operation in the fall of 1991. The D0 muon detection system is composed of three major toroids referred to respectively as the Central Field (CF) toroid and the End Field (EF) toroids. The complete detector weighs in excess of 4000 metric tons and rests on a steel platform. The muon detection system was designed using standard 2D codes and flux maps inside were obtained for each of the toroids taken separately. Various magnetic field measurements were performed; discrepancies with the design calculations have been observed and attributed to three dimensional effects. In this paper, we compare the predictions of the 2D computations to 3D calculations for a fully assembled detector. We also estimate the electromagnetic forces between the toroids and discuss other 3D effects, in particular, the effect of the supporting platform. 4 refs., 3 figs.

7418 (FNAL/C–91/297) **The Fermilab D0 Master Clock System.** Rotolo, C.; Fachin, M.; Chappa, S.; Rauch, M.; Needles, C.; Dyer, A. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-911106–38: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004120. Source: OSTI; NTIS; INIS; GPO Dep.

The Clock System provides bunch crossing related timing signals to various detector subsystems. Accelerator synchronization and monitoring as well as timing signal generation and distribution are discussed. The system is built using three module types implemented in Eurostandard hardware with a VME communications interface. The first two types of modules are used to facilitate synchronization with the accelerator and to generate 23 timing signals that are programmable with one RF bucket (18.8 ns) resolution and 1 ns accuracy. Fifty-four of the third module type are used to distribute the timing signals and two synchronous 53 MHz and 106 MHz clocks to various detector subsystems. 6 refs., 5 figs.

7419 (FNAL/C–91/302) **Status of the silicon strip high-rate FASTBUS readout system.** Gonzalez, H.; Barsotti, E.; Bowden, M.; Christian, D.; Chramowicz, J.; Fachin, M.; Haldeman, M.; Hoff, J.; Holmes, S.; Rotolo, C.; Romero, A.; Slimmer, D.; Swoboda, C.; Trendler, R.; Urish, J.; Yarema, R.; Zimmerman, T.; Zimmermann, S.; Kowald, W.; MacManuFermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-911106–37: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004121. Source: OSTI; NTIS; INIS; GPO Dep.

Our new readout system was developed in collaboration with, and largely to the specification of, the E771 experimenters. E771 is a fixed target experiment designed to study the production of B hadrons by an 800 GeV/c proton beam. The experiment will operate at rates of up to 200 million beam protons per second and 10 million interactions per second. The experimental apparatus will consist of an open geometry magnetic spectrometer featuring good muon and electron identification (much of which was used in E705), and a compact 16000 channel Silicon Strip Detector. In order to satisfy the experimenter's desire to instrument 16000 SSD elements in a package only 5 cm wide, 5 cm high, and 21 cm deep, and in order to meet the performance specifications, we have made extensive use of "Application Specific Integrated Circuits" (ASIC's).

7420 (FNAL/C–91/314) **Performance and system flexibility of the CDF Hardware Event Builder.** Shaw, T.M. (Fermi National

Accelerator Lab., Batavia, IL (United States)); Schurecht, K.; Sinervo, P. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-911106–49: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004806. Source: OSTI; NTIS; INIS; GPO Dep.

The CDF Hardware Event Builder [1] is a flexible system which is built from a combination of three different 68020-based single width Fastbus modules. The system may contain as few as three boards or as many as fifteen, depending on the specific application. Functionally, the boards receive a command to read out the raw event data from a set of Fastbus based data buffers ("scanners"), reformat data and then write the data to a Level 3 trigger/processing farm which will decide to throw the event away or to write it to tape. The data acquisition system at CDF will utilize two nine board systems which will allow an event rate of up to 35 Hz into the Level 3 trigger. This paper will present detailed performance factors, system and individual board architecture, and possible system configurations.

7421 (FNAL/C–91/315) **Commissioning of the control and data acquisition electronics for the CDF Silicon Vertex Detector.** Tkaczyk, S.M. (Fermi National Accelerator Lab., Batavia, IL (United States)); Turner, K.J.; Nelson, C.A.; Shaw, T.M.; Wesson, T.R.; Bailey, M.W.; Kruse, M.C.; Castro, A. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-911106–46: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004809. Source: OSTI; NTIS; INIS; GPO Dep.

The SVX data acquisition system includes three components: a Fastbus Sequencer, an SVX Rabbit Crate Controller and a Digitizer. These modules are integrated into the CDF DAQ system and operate the readout chips. The results of the extensive functional tests of the SVX modules are reported. We discuss the stability of the Sequencers, systematic differences between them and methods of synchronization with the Tevatron beam crossings. The Digitizer ADC calibration procedure run on the microsequencer is described. The microsequencer code used for data taking and SVX chip calibration modes is described. Measurements of the SVX data scan time are discussed.

7422 (FNAL/C–91-316) **Software development tools for the CDF MX scanner.** Stuermer, W.; Turner, K.; Littleton-Sestini, S. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-911106–48: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004807. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discuses the design of the high level assembler and diagnostic control program developed for the MX, a high speed, custom designed computer used in the CDF data acquisition system at Fermilab. These programs provide a friendly productive environment for the development of software on the MX. Details of their implementation and special features, and some of the lessons learned during their development are included.

7423 (FNAL/C–91/317) **Control and data acquisition electronics for the CDF Silicon Vertex Detector.** Turner, K.J.; Nelson, C.A.; Shaw, T.M.; Wesson, T.R. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-911106–39: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004119. Source: OSTI; NTIS; INIS; GPO Dep.

A control and data acquisition system has been designed for the CDF Silicon Vertex Detector (SVX) at Fermilab. The system controls the operation of the SVX Rev D integrated circuit (SVX IC) that is used to instrument a 46,000 microstrip silicon detector. The system consists of a Fastbus Sequencer, a Crate Controller and Digitizer modules. 11 refs., 6 figs., 3 tabs.

7424 (FNAL/C–91/319) **The upgraded CDF front end electronics for calorimetry.** Drake, G.; Frei, D.; Hahn, S.R.; Nelson, C.A.; Segler, S.L.; Stuermer, W. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-911106–50: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004805. Source: OSTI; NTIS; INIS; GPO Dep.

The front end electronics used in the calorimetry of the CDF detector has been upgraded to meet system requirements for higher expected luminosity. A fast digitizer utilizing a 2 μSec, 16 bit ADC has been designed and built. Improvements to the front end trigger circuitry have been implemented, including the production of 900 new front end modules. Operational experience with the previous system is presented, with discussion of the problems and performance goals.

7425 (FNAL/C–91/320) **System software design for the CDF Silicon Vertex Detector.** Tkaczyk, S. (Fermi National Accelerator Lab., Batavia, IL (United States)); Bailey, M. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-911106–47: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004808. Source: OSTI; NTIS; INIS; GPO Dep.

An automated system for testing and performance evaluation of the CDF Silicon Vertex Detector (SVX) data acquisition electronics is described. The SVX data acquisition chain includes the Fastbus Sequencer and the Rabbit Crate Controller and Digitizers. The Sequencer is a programmable device for which we developed a high level assembly language. Diagnostic, calibration and data acquisition programs have been developed. A distributed software package was developed in order to operate the modules. The package includes programs written in assembly and Fortran languages that are executed concurrently on the SVX Sequencer modules and either a microvax or an SSP. Test software was included to assist technical personnel during the production and maintenance of the modules. Details of the design of different components of the package are reported.

7426 (FNAL-TM–1765) **A combination drift chamber/pad chamber for very high readout rates.** Spiegel, L. (Fermi National Accelerator Lab., Batavia, IL (United States)); Cataldi, G.; Elia, V.; Mazur, P.; Murphy, C.T.; Smith, R.P.; Yang, W.; Alexopoulos, T.; Durandet, C.; Erwin, A.; Jennings, J.; Antoniazzi, L.; Introzzi, G.; Lanza, A.; Liguori, G.;Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE92004754. Source: OSTI; NTIS; INIS; GPO Dep.

Six medium-sized ($\approx 1 \times 2$ m^2) drift chambers with pad and stripe readout have been constructed for and are presently operating in Fermi National Accelerator Laboratory experiment E-771. Each chamber module actually represents a pair of identical planes: two sets of anode wires, two sets of stripes, and two sets of pads. The wire planes are read out separately and represent X measurements in the coordinate system of the experiment. The twin stripe and pad planes are internally paired within the chamber modules; stripe signals represent Y measurements and pad signals combination X and Y measurements. Signals which develop on the stripes and pads are mirror (but inverted) images of what is seen on the wires. In addition to being used in the off-line pattern recognition, pad signals are also used as inputs to an on-line high transverse momentum (pt) trigger processor. While the techniques involved in the design and construction of the chambers are not novel, they may be of interest to experiments contemplating very large area, high rate chambers for future spectrometers.

7427 (FNAL-TM–1766) **"Massless gaps" for solenoid + calorimeter.** Marraffino, J.; Wu, W.; Beretvas, A.; Green, D.; Denisenko, K.; Para, A. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1991. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE92006750. Source: OSTI; NTIS; INIS; GPO Dep.

The necessary existence of material in front of the first active element in a calorimeter will degrade the performance of that device. The question is by what factor. The follow up question is what can be done to minimize the damage. These questions are usually of primary importance for liquid argon calorimetry because of the necessity of containment dewars. However, the problem is universal.

For example, the Solenoid Detector Collaboration, SDC, has proposed a superconducting coil which would be placed in front of the EM calorimeter. Although much effort has been made to minimize the depth of material in the coil, still the resolution and linearity must be optimized if the SDC goal of precision electromagnetic (EM) calorimetry is to be realized.

7428 (IAEA-TECDOC-619) **X-ray and gamma-ray standards for detector calibration.** International Atomic Energy Agency, Vienna (Austria). Sep 1991. 157p. Order Number DE92615125. Source: OSTI; NTIS (US Sales Only); INIS.

The IAEA established a Co-ordinated Research Programme (CRP) on the Measurements and Evaluation of X- and Gamma-Ray Standards for Detector Efficiency Calibration in 1986 with the aim of alleviating the generation of such discrepancies. Within the framework of this CRP, representatives of nine research groups from six Member States and one international organization performed a number of precise measurements and systematic in-depth evaluations of the required decay data. They have also contributed to the development of evaluation methodology and measurement techniques, and stimulated a number of such studies at laboratories not directly involved in the IAEA project. The results of the work of the CRP, which was finished in 1990, are presented in this report. Recommended values of half-lives and photon emission probabilities are given for a carefully selected set of radionuclides that are suitable for detector efficiency calibration (X-rays from 5 to 90 keV and gamma-rays from 30 to about 3000 keV). Detector efficiency calibration for higher gamma-ray energies (up to 14 MeV) is also considered. The evaluation procedures used to obtain the recommended values and their estimated uncertainties are reported, and a summary of the remaining discrepancies is given. Refs and tabs.

7429 (INDC(EGY)-006/L) **A low background pulsed neutron polyenergetic beam at the ET-RR-1 reactor.** Adib, M. (Atomic Energy Establishment, Cairo (Egypt). Reactor and Neutron Physics Dept.); Abdel-Kawy, A.; Habib, N.; Abu-El-Ela, M.; Wahba, M.; Kilany, M. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Dec 1991. 10p. Project EGY/1/016. Order Number DE92615126. Source: OSTI; NTIS (US Sales Only); INIS.

A low background pulsed neutron polyenergetic thermal beam at ET-RR-1 is produced by a rotor and rotating collimator suspended in magnetic fields. Each of them is mounted on its mobile platform and whose centres are 66 cm apart, rotating synchronously at speeds up to 16000 rpm. It was found that the neutron burst produced by the rotor with almost 100% transmission passes through the collimator, when the rotation phase between them is 28.8 deg. Moreover the background level achieved at the detector position is low, constant and free from peaks due to gamma rays and fast neutrons accompanying the reactor thermal beam. 7443 (Juel–2420) **An induction drift chamber with flash ADC selection.** Steinkamp, O. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Kernphysik. Jan 1991. 125p. (In German). Order Number DE92750199. Source: OSTI; NTIS (US Sales Only); INIS.

The induction drift chamber is a unique type of detector in that it combines high spatial resolution ($\simeq$ 25 μm for vertical tracks) and rate tolerance ($\simeq 10^6 e^-/(cm^2 s)$) with a low mass per unit length. The angular dependence can be limited to $\leq$ 0.5 μm/1deg with suitable gases. A multilevel test chamber was constructed and tested with minimum-ionisation electrodes. It was shown that stable operation of a non-symmetrical IDC is possible with cathode spacing of 0.5 mm and 3.0 mm, and that the FADC selection permits the resolution of the time structure of the signals and yields consistent results. (orig./DG).

The very large enhancement of parity nonconservation (PNC) effect in neutron-nucleus reaction has been studied for a decade. The enhancement of the PNC effect has an interesting point, namely the mechanism of enhancement is expected also for time reversal symmetry breaking terms. The longitudinal asymmetry in (n, gamma) reaction cross sections has been studied for several nuclei. Very large enhancement with magnitude up to 10^6 has been observed in the radiative capture p-wave resonance of La-139 at the incident neutron energy of 0.734 eV. In the experiment, capture gamma ray and transmitted neutrons were counted as a function of the neutron energy using the time of flight method. The gamma ray detection takes an advantage to identify the radiative capture reaction, while the neutron transmission includes the large contribution of neutron scattering. In this report, the current experimental arrangement and the recent results are described. The experiment was carried out in a polarized neutron beam line at KENS. The counters, the measurement of the longitudinal asymmetry and the development for exclusive gamma ray detection are reported. (K.I.).

7447 (LA-UR–91-3489) **Warhead counting using neutron scintillators: Detector development, testing, and demonstration.** Byrd, R.C.; Auchampaugh, G.F.; Moss, C.E.; Feldman, W.C. Los Alamos National Lab., NM (United States). [1991]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-911106–18: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92003798. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Although the number of warheads on a missile can be determined relatively simply by a scan of the emitted gamma radiation, this approach may be considered too intrusive because of the possibility of revealing high-resolution energy or position information. Neutron spectra are nearly featureless, and obtaining the position resolution needed to reveal warhead details would be very difficult. We describe the development of a fast-neutron detector based on a boron-loaded plastic scintillator used previously for space applications. The detector rejects gammas and scattered low-energy neutrons, and its segmentation allows narrow fan-shaped collimation within ±20° horizontally and ±50° vertically. Testing includes distinguishing between mockups with either two or three warheads and locating the ten warheads on a silo-based Peacekeeper missile. 2 refs., 13 figs.

7448 (LA-UR–91-3514) **Detection of uranium-based nuclear weapons using neutron-induced fission.** Moss, C.E. (Los Alamos National Lab., NM (United States)); Byrd, R.C.; Feldman, W.C.; Auchampaugh, G.F.; Estes, G.P.; Ewing, R.I.; Marlow, K.W. Los Alamos National Lab., NM (United States). [1991]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36 ;AC04-76DP00789. (CONF-911106–30: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92003865. Source: OSTI; NTIS; INIS; GPO Dep.

Although plutonium-based nuclear weapons can usually be detected by their spontaneous emission of neutrons and gammas, the radiation emitted by weapons based entirely on highly-enriched uranium can often be easily shielded. Verification of a treaty that limits the number of such weapons may require an active technique, such as interrogating the suspect assembly with an external neutron source and measuring the number of fission neutrons produced. Difficulties include distinguishing between source and fission neutrons, the variations in yield for different materials and geometries, and the possibility of non-nuclear weapons that may contain significant amounts of fissionable depleted uranium. We describe simple measurements that test the induced-fission technique using an isotopic Am-Li source, an novel energy-sensitive neutron detector, and several small assemblies containing ^{235}U, ^{238}U, lead, and polyethylene. In all cases studied, the neutron yields above the source energy are larger for the ^{235}U assemblies than for assemblies containing only lead or depleted uranium. For more complex geometries, corrections for source transmission may be necessary. The results are promising enough to recommend further experiments and calculations using examples of realistic nuclear and non-nuclear weapons. 5 refs., 11 figs.

7449 (LA-UR–91-3553) **The vertex detector for the Lepton/Photon Collaboration.** Sullivan, J.P.; Boissevain, J.G.; Fox, D.; van Hecke, H.; Jacak, B.V.; Kapustinsky, J.S.; Leitch, M.J.; McGaughey, P.L.; Moss, J.M.; Sondheim, W.E. Los Alamos National Lab., NM (United States). [1991]. 30p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-9110232–2: Symposium on Relativistic Heavy Ion Collider (RHIC) detector R&D, Upton, NY (United States), 10-11 Oct 1991). Order Number DE92005021. Source: OSTI; NTIS; INIS; GPO Dep.

The conceptual design of the vertex detector for the Lepton/Photon Collaboration at RHIC is described, including simulations of its expected performance. The design consists of two concentric layers of single-sided Si strips. The expected performance as a multiplicity detector and in measuring the pseudo-rapidity η distribution is discussed as well as the expected vertex finding efficiency and accuracy. Various options which could be used to reduce the cost of the detector are also discussed.

7450 (LA-UR–91-3657) **Simulations of a spectral gamma-ray logging tool response to a surface source distribution on the borehole wall.** Wilson, R.D. (Highland Scientific Ltd., Ashland, OR (United States)); Conaway, J.G. Los Alamos National Lab., NM (United States). [1991]. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-911106–16: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92003727. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed Monte Carlo and discrete ordinates simulation models for the large-detector spectral gamma-ray (SGR) logging tool in use at the Nevada Test Site. Application of the simulation models produced spectra for source layers on the borehole wall, either from potassium-bearing mudcakes or from plate-out of radon daughter products. Simulations show that the shape and magnitude of gamma-ray spectra from sources distributed on the borehole wall depend on radial position with in the air-filled borehole as well as on hole diameter. No such dependence is observed for sources uniformly distributed in the formation. In addition, sources on the borehole wall produce anisotropic angular fluxes at the higher scattered energies and at the source energy. These differences in borehole effects and in angular flux are important to the process of correcting SGR logs for the presence of potassium mudcakes; they also suggest a technique for distinguishing between spectral contributions from formation sources and sources on the borehole wall. These results imply the existence of a standoff effect not present for spectra measured in air-filled boreholes from formation sources. 5 refs., 11 figs.

7451 (LA-UR–91-3871) **Applications of the LAHET simulation code to relativistic heavy ion detectors.** Waters, L.S.; Gavron, A. Los Alamos National Lab., NM (United States). [1991]. 13p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9110232–3: Symposium on Relativistic Heavy Ion Collider (RHIC) detector R&D, Upton, NY (United States), 10-11 Oct 1991). Order Number DE92005016. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos High Energy Transport (LAHET) simulation code has been applied to test beam data from the lead/scintillator Participant Calorimeter of BNL AGS experiment E814. The LAHET code treats hadronic interactions with the LANL version of the Oak Ridge code HETC. LAHET has now been expanded to handle hadrons with kinetic energies greater than 5 GeV with the FLUKA code, while HETC is used exclusively below 2.0 GeV. FLUKA is phased in linearly between 2.0 and 5.0 GeV. Transport of electrons and photons is done with EGS4, and an interface to the Los Alamos HMCNP3B library based code is provided to analyze neutrons with kinetic energies less than 20 MeV. Excellent agreement is found between the test data and simulation, and results for 2.46 GeV/c protons and pions are illustrated in this article.

7452 (LBL–30606) **Amorphous Ge bipolar blocking contacts on Ge detectors.** Luke, P.N.; Cork, C.P.; Madden, N.W.; Rossington, C.S.; Wesela, M.F. Lawrence Berkeley Lab., CA (United States). Oct 1991. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-911106–45: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004094. Source: OSTI; NTIS; INIS; GPO Dep.

Semiconductor nuclear radiation detectors are usually operated in a full depletion mode and blocking contacts are required to maintain low leakage currents and high electric fields for charge collection. Blocking contacts on Ge detectors typically consist of n-type contacts formed by lithium diffusion and p-type contacts formed by boron ion implantation. Electrical contacts formed using sputtered amorphous Ge (a-Ge) films on high-purity Ge crystals were found to exhibit good blocking behavior in both polarities with low leakage currents. The a-Ge contacts have thin dead layers associated with them and can be used in place of lithium-diffused, ion-implanted or Schottky barrier contacts on Ge radiation detectors. Multi-electrode detectors can be fabricated with very simple processing steps using these contacts. 12 refs.

7453 (LBL–31383) **Enhanced columnar structure in CsI layer by substrate patterning.** Jing, T. (Lawrence Berkeley Lab., CA (United States)); Cho, G.; Drewery, J.; Kaplan, S.N.; Mireshghi, A.; Perez-Mendez, V.; Wildermuth, D.; Fujieda, I. Lawrence Berkeley Lab., CA (United States). Oct 1991. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-911106–44: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004099. Source: OSTI; NTIS; INIS; GPO Dep.

Columnar structure in evaporated CsI layers can be controlled by patterning substrates as well as varying evaporation conditions. Mesh-patterned substrates with various dimensions were created by spin-coating polyimide on glass or amorphous silicon substrates and defining patterns with standard photolithography technique. CsI(Tl) layers 200–1000 μm were evaporated. Scintillation properties of these evaporated layers, such as light yield and speed, were equivalent to those of the source materials. Spatial resolution of X-ray detectors consisting of these layers and a linear array of X-ray detectors consisting of these layers and a linear array of Si photodiodes was evaluated by exposing them to a 25μm narrow beam of X-ray. The results obtained with 200μm thick CsI layers coupled to a linear photodiode array with 20 dots/mm resolution showed that the spatial resolution of CsI(Tl) evaporated on patterned substrates was about 75 μm FWHM, whereas that on CsI(Tl) on flat substrates was about 230 μm FWHM. Micrographs taken by SEM revealed that these layers retained the well-defined columnar structure originating from substrate patterns. Adhesion and light transmission of CsI(Tl) were also improved by patterning the substrate.

7454 (LBL–31415) **Noise in a-Si:H p-i-n detector diodes.** Cho, G.; Qureshi, S.; Drewery, J.S.; Jing, T.; Kaplan, S.N.; Lee, H.; Mireshghi, A.; Perez-Mendez, V.; Wildermuth, D. Lawrence Berkeley Lab., CA (United States). Oct 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-911106–42: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004172. Source: OSTI; NTIS; INIS; GPO Dep.

Noise of a-Si:H p-i-n diodes ($5 \sim 50$ μm thick) under reverse bias was investigated. The current dependent 1/f type noise was found to be the main noise component at high bias. At low bias the thermal noise from a series resistance of the p-layer and of the metallic contacts is the dominant noise source which is unrelated to the reverse current through the diode. The noise associated with the p-layer resistance decreased significantly on annealing under reverse bias, reducing the total zero bias noise by a factor 2 approximately. The noise recovered to the original value on subsequent annealing without bias. In addition to the resistive noise there seems to be a shaping time independent noise component at zero biased diodes.

7455 (MPE–225) **Diffusion and drift of charges in semiconductor detectors.** Meidinger, N. Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany). Inst. fuer Extraterrestrische Physik; Technische Univ. Muenchen, Garching (Germany). Fakultaet fuer Physik. Jan 1991. 73p. (In German). Order Number DE92758917. Source: OSTI; NTIS (US Sales Only); INIS.

For this analysis, a fully depleteable pn-CCD (a novel, energy and local resolution semiconductor using the drift chamber principle) has been tested for verification at different temperatures, photon energies, and drift times, including theoretical calculations. Experimental results are in good agreement with calculated data, and deviations ($\leq$11%) have been understood to an extent that proposals can be made for improving the accuracy. Charge splitting has been found to be reduced in the case of reduced charge collecting areas, i.e. for example at lower temperatures, or with shorter drift times. This effect is also reduced in the case of larger charge collecting areas (pixels). With the given topology of the cell structure, the charge splitting can be much more strongly suppressed as compared to other X-ray CCD design types. (orig.).

7456 (NIKHEF-H–91-11) **The Honeycomb Strip Chamber: The application in LHC/SSC experiments and the test results of a prototype.** Graaf, Harry van der (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H); Buskens, Joop; Rewiersma, Paul; Faber, Gerard; Koenig, Adriaan; Wijnen, Thei. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H. Jun 1991. 33p. Order Number DE92613872. Source: OSTI; NTIS (US Sales Only); INIS.

The Honeycomb Strip Chamber (HSC) is a new position sensitive detector. It consists of a stack of folded foils, forming a rigid honeycomb structure. In the centre of each hexagonal cell a wire is strung. Conducting strips on the foils, perpendicular to the wires, pick up the induced avalanche charge. Test results of a prototype show that processing the signals form three adjacent strips nearest to the track gives a spatial resolution better than 64 μm for perpendicular incident tracks. The chamber performance is only slightly affected by a magnetic field. (author). 25 refs.; 21 figs.

7457 (NIKHEF-H–91-14) **The Micro Trench Gas Counter: A novel approach to high luminosity tracking in HEP.** Schmitz, J. (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H). Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H. Jul 1991. 14p. Order Number DE92613878. Source: OSTI; NTIS (US Sales Only); INIS.

A novel design is presented for a gas avalanche chamber with micro-strip gas readout. While existing gaseous microstrip detectors (Micro-strip Gas Counters, Knife edge chambers) have a minimum anode pitch of the order of 100 μm, the pitch of the discussed Micro Trench Gas Counter goes down to 30-50 μm. This leads to a better position resolution and two track separation, and a higher radiation resistivity. Its efficiency and signal speed are expected to be the same as the Microstrip Gas Counter. The energy resolution of the device is expected to be equal to or better than 10 percent for the ^{55}Fe peak. Since the anode strip dimensions are larger than those in a MSGC, the device may be not as sensitive to discharges and mechanical damage. In this report production of the device is briefly described, and predictions on its operation are made based on electric field calculations and experience with the Microstrip Gas Counter. The authors restrict themselves to the application in High Energy Physics. (author). 10 refs.; 9 figs.

7458 (NIKHEF-H–91-21) **Optimization of the microstrip gas counter.** Geijsberts, M.H.J. (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H); Hartjes, F.G.; Pannekoek, J.G.; Schmitz, J.; Udo, F. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H. Aug 1991. 14p. (CONF-9105263–: 5. Pisa meeting on advanced detectors, Isola d'Elba (Italy), 26-31 May 1991). Order Number DE92613879. Source: OSTI; NTIS (US Sales Only); INIS.

A study has been made to optimize the characteristics of the micro-strip gas counter for use as a tracer at the LHC. In this framework the authors found that two of the most important design parameters of the detector are given by the choice of the counter gas and the width of the gas gap. In this report the authors deduce, using measurements done with a UV laser and a particle beam, two most suited mixtures which consist of xenon, di-methyl-ether and CO_2. Also the optimum width of the gas gap is derived. Here an efficient tagging will be possible at the LHC frequency. (author). 8 refs.; 6 figs.

7459 (NIKHEF-H–91-23) **Tests of the performance of different gas mixtures in microstrip gas counters.** Geijsberts, M. (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H); Hartjes, F.G.; Pannekoek, J.G.; Schmitz, J.; Udo, F. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H. Sep 1991. 24p. Order Number DE92613880. Source: OSTI; NTIS (US Sales Only); INIS.

This article describes measurements of the electron drift and diffusion parameters in gas mixtures, suited for application in a micro-strip gas counter. The aims were to optimize for position resolution, detection efficiency and response time. The measurements were done in mixtures of Ar, CF_4, C_2H_6, Xe, CO_2 and DME using a pulsed UV laser beam. Results are reported from tests in a particle beam for efficiency and position resolution of the counter using the two gases found to be most promising in the laser tests. (author). 6 refs.; 15 figs.; 1 tab.

7460 **Improved ionization chamber dosimeter.** Renner, T.R.; Nyman, M.A.; Stradtner, R. To Dept. of Energy. 1990. Filed date 16 Apr 1990. USA Patent patent application 7-509,121. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE92003876. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a method for fabricating an ion chamber dosimeter collecting array of the type utilizing plural discrete elements formed on a uniform collecting surface which includes forming a thin insulating layer over an aperture in a frame having surfaces, forming a predetermined pattern of through holes in the layer, plating both surfaces of the layer and simultaneously tilting and rotating the frame for uniform plate-through of the holes between surfaces. Aligned masking and patterned etching of the surfaces provides interconnects between the through holes and copper leads provided to external circuitry.

7461 **X-ray imaging system.** Sommargren, G.E.; Weaver, H.J. To Dept. of Energy. 1990. Filed date 30 Apr 1990. USA Patent patent application 7-516,401. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. Order Number DE92003830. Source: OSTI; NTIS; GPO Dep.

The invention provides a method and apparatus for focusing and imaging x-rays. An opaque sphere is used as a diffractive imaging element to diffract x-rays from an object so that the divergent x-ray wavefronts are transformed into convergent wavefronts and are brought to focus to form an image of the object with a large depth of field. 6 figs.

7462 **Real time Faraday spectrometer.** Smith, T.E. Jr.; Struve, K.W.; Colella, N.J. To Dept. of Energy. 1990. Filed date 30 Apr 1990. USA Patent patent application 7-516,402. 23p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92004608. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a charged particle spectrometer that contains a detection system which embodies the benefits of both foil-light emissions and faraday cups, yet it does not interfere with the particle beam. 5 Figs. (GHH)

7463 **A circuit for monitoring electric currents produced by a twin bridge calorimeter.** Donohoue, T.P.; Oertal, C.P.; Tyree, W.H.; Valdez, J.L. To Dept. of Energy. 1990. Filed date 19 Jun 1990. USA Patent patent application 7-540,240. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC34-90DP62349. Order Number DE92003811. Source: OSTI; NTIS; GPO Dep.

A circuit for measuring temperature differentials in a calorimeter is disclosed. The temperature differential between the reference element and sample element containing a radioactive material is measured via a wheatstone bridge arrangement of thermistors. The bridge is driven with an alternating current on a pulsed basis to maintain the thermal floor of the calorimeter at a low reference value. A lock-in amplifier connected to the bridge phase locks a signal from the bridge to the input pulsed AC signal to provide a DC voltage. The DC voltage is sampled over time and provided to a digital computer. The digital computer, using curve fitting algorithms, will derive a function for the sample data. From the function, an equilibrium value for the temperature may be calculated. 4 figs.

7464 **Punchcode reader system for dosimeters.** Langsted, J.M. To Dept. of Energy. 1990. Filed date 31 Jul 1990. USA Patent patent application 7-560,667. 31p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC34-90DP62349. Order Number DE92003828. Source: OSTI; NTIS; GPO Dep.

A punchcode reader is provided for reading data encoded in a punchcode hole array on a dosimeter. The dosimeter falls through a passage in the reader containing photosensor detectors disposed along the passage which provide output signals to a microprocessor. The signals are processed to determine the orientation of the dosimeter in the reader, the location and state of punchcode holes in a two row array thereby decoding the encoded data. Multiple rate of fall calculations are made, and if appropriate matching of the punchcode array is not obtained in three tries, an error signal is outputted to the operator. The punchcode reader also provides for storage of data from multiple dosimeters passed through the reader, and for the output of decoded data to an external display or a computer for further processing. 2 figs.

7465 (PCCF-RI–90-16) **A dilepton spectrometer project for SIS.** Roche, G. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. 1990. 6p. (CONF-9011256–: 4. Journees des theoriciens Saturne on Dilepton production in nucleon-nucleon and nucleon-nucleus collisions at relativistic energies, Saclay (France), 22-23 Nov 1990). Order Number DE92733612. Source: OSTI; NTIS (US Sales Only).

No abstract available. Published in summary form only. 4 figs.

7466 (PNL–7600-Pt.1, pp. 65-69) **Aerosol technology development.** James, A.C. Pacific Northwest Lab., Richland, WA (United States). Jun 1991. In *Pacific Northwest Laboratory annual report for 1990 to the DOE Office of Energy Research. Part 1, Biomedical sciences.* 151p. Order Number DE91015807. Source: OSTI; NTIS.

The purpose of this project is to develop and transfer aerosol technology to basic and applied research in biology and chemistry, especially in the areas of health and environmental effects of energy-related materials. The ongoing objective is to improve systems for the control, monitoring, and characterization of exposures of laboratory animals to toxic aerosols, gases, and vapors. The current thrust is to improve the metrology, control, and characterization of exposures to radon progeny in studies of the mechanisms of radon-induced respiratory tract cancer and to provide a new and simpler technique to characterize exposure to unattached radon progeny in domestic or occupational settings. The authors report here the design and development of an Unattached Radon Progeny Size-Spectrometer to measure the concentration and unattached fraction of potential alpha energy in air and also the activity-size distribution of the unattached progeny.

7467 (SAND–91-2451C) **Segmentation of x-ray images using Probabilistic Relaxation Labeling.** Thai, T.Q. Sandia National Labs., Albuquerque, NM (United States). [1991]. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9111129–2: FAA explosives detection symposium, Atlantic City, NJ (United States), 13-15 Nov 1991). Order Number DE92002988. Source: OSTI; NTIS; GPO Dep.

Segmentation is a process of separating objects of interest from their background or from other objects in an image. Without a suitable segmentation scheme, it is very difficult to detect contraband in X-rays images. In this paper, a Probabilistic Relaxation Labeling (PRL) segmentation scheme is presented and compared with other segmentation methods. PRL segmentation is an interative algorithm that labels each pixel in an image by cooperative use of two information sources: the pixel probability and the degree of certainty of its probability supported by the neighboring pixels. The practical implementation and results of the PRL segmentation on X-ray baggage images are also discussed and compared with other segmentation methods. 13 refs., 12 figs.

7468 (SLAC-PUB–5642-Rev.) **Progress and commissioning of the SLD Cherenkov Ring Imaging Detector: Revision.** Abe, K. (Tohoku Univ., Sendai (Japan). Dept. of Physics); Hasegawa, K.; Suekane, F.; Yuta, H.; Antilogus, P.; Aston, D.; Bienz, T.; Bird, F.; Dasu, S.; Dolinsky, S.; Dunwoodie, W.; Hallewell, G.: Kawahara, H.; Kwon, Y.; Leith, D.W.G.S.; Muller, D.; Nagamin-Stanford Univ., CA (United States). Nov 1991. 2p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-910881–6-Rev.: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92004947. Source: OSTI; NTIS; INIS; GPO Dep.

We report the recent progress of the SLD Cherenkov Ring Imaging Detector. All of the individual components of the device (TPC's, mirrors, liquid radiator trays) have been completed and installed.

Almost half of the electronics packages are installed and operational, and the data acquisition system has been commissioned. The liquid C_6F_{14} recirculation system is functioning. The drift gas supply systems are operating well with TMAE, and the gaseous Freon C_5F_{12} recirculator is being brought on-line. Our monitor and control systems are fully functional. The commissioning of all 40 TPCs at full operating voltage has gone very smoothly. The system shows a remarkable immunity to the SLC backgrounds, and yields very clean events, while operating with a single electron sensitivity.

7469 (SLAC-PUB-5678) **Large acceptance magnetic spectrometers for polarized deep inelastic electron scattering.** Petratos, G.G.; Eisele, R.L.; Gearhart, R.A.; Hughes, E.W.; Young, C.C. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1991. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-911106-51: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92004948. Source: OSTI; NTIS; INIS; GPO Dep.

The design of two magnetic spectrometers for the measurement of the spin-dependent structure function g_1^n of the neutron and a test of the Bjorken sum rule is described. The measurement will consist of scattering 23 GeV polarized electrons off a polarized ^{3}He target and detecting scattered electrons of 7 to 18 GeV at 4.5° and 7°. Each spectrometer is based on two large aperture dipole magnets bending in opposite directions. This "reverse" deflection design doubles the solid angle as compared to the conventional design of same direction bends used in previous experiments. Proper choice of the deflection angles and the distance between the two dipoles in each spectrometer allows background photons from radiative processes to reach the detectors only after at least two bounces off the spectrometer vacuum walls, resulting in an expected tolerable background. Each spectrometer is equipped with a pair of Cerenkov detectors, a pair of scintillation hodoscopes and a lead-glass shower calorimeter providing electron and pion identification with angular and momentum resolutions sufficient for the experimental measurement. 7 refs., 8 figs., 1 tab.

7470 (UCRL-CR-108465) **X-ray optics for plasma diagnostics: Final report, October 1, 1988–January 1, 1991.** Knight, L.V. (Brigham Young Univ., Provo, UT (United States)). Lawrence Livermore National Lab., CA (United States); Brigham Young Univ., Provo, UT (United States). Aug 1991. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003967. Source: OSTI; NTIS; GPO Dep.

This report summarizes the work performed by Brigham Young University (BYU) while under contract with the Advanced X-ray Optics Program (AXOP) at Lawrence Livermore National Laboratory (LLNL) from October 1988 to January 1991. The main accomplishments were in the areas of characterization of x-ray optical components, upgrading AXOP's X-ray CCD camera, and completing an initial design study for a high-energy (10 KeV) x-ray microscope. Progress in each of these areas is described below. 10 figs.

7471 (UCRL-ID-108489) **Muon drift chamber physics and engineering R and D activities for the L* and GEM Detectors in FY 1991.** Ables, E.; Bionta, R.M.; Britt, H.C.; Capell, M.; Chargin, A.K.; Deis, G.A.; Fackler, O.D.; Johnson, C.V. III; Lowry, M.E.; Makowiecki, D.M.; Masquelier, D.A.; McCammon, K.; McConaghy, C.F.; Olson, H.E.; Schmitt, E.H.; Skulina, K.M.; Vital, R.L.; Wenaus, TLawrence Livermore National Lab., CA (United States). 25 Sep 1991. 68p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92004624. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) joined the multinational L* Detector collaboration in early 1990. The L* Detector has been described in great detail in a number of documents submitted to the Superconducting Super Collider (SSC) Laboratory. LLNL's participation in the L* collaboration consisted of a multidisciplinary effort involving a number of physicists, engineers and technologists from different areas of the laboratory who came together to identify areas of research, development and engineering on the L* Detector where LLNL's expertise and technological capabilities could best be utilized. Among these capabilities, superconducting magnet technology, chemistry and materials science, and design of new types of physics detectors were deemed areas of LLNL expertise best suited to the R&D effort needed for L*. This paper will describe the work carried out at LLNL on muon chamber R&D for the L* detector in FY 1991. Because of the L* proposal rejection in May 1991, and the subsequent restructuring to form the GEM detector collaboration in July 1991, the work described in this paper will also be seen to the applicable to the envisioned muon chamber subsystem for GEM.

7472 (UCRL-ID-108736) **Argon SDC detector cryogenic design.** Slack, D.S. Lawrence Livermore National Lab., CA (United States). 25 Oct 1991. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92004470. Source: OSTI; NTIS; GPO Dep.

A first cut at designing the cryogenic systems is resented. The point design or sample design presented includes flow-rate calculations, piping sizes, dewar elevations, etc. In summary, the analysis shows argon cooling is ample even with relatively small piping, headers, dewar elevations, etc. This will afford the designer considerable latitude to change the design as required to meet other system requirements. For example, dewar elevation above the detector and horizontal distance to the detector could be varied to meet hall-space requirements. The point design shows a simple system with only one argon supply-and-return pipe to the detector. No nitrogen cooling is required at the detector. No seals or piping (except for an open supply and return header) are required in the detector and a minimum, of baffling to director argon flow is required. No thermal insulation is required to protect modules from pre-amp heat. A simple temperature control technique for the argon loop using a single nitrogen dewar and heat exchanger is shown.

7473 (USIP-91-02) **Exploratory study for a solid-state charged-particle spectrometer inside the celsius ring: $\alpha + {}^1H$ reactions at 1.7 and 2.2 GeV/c.** Bargholtz, C.; Fransson, K.; Holmberg, L.; Lindh, K.; Sandberg, L.; Tegner, P.E.; Thoerngren-Engblom, P.; Vojdani, D. Stockholm Univ. (Sweden). Inst. of Physics. Aug 1991. 30p. Order Number DE92613881. Source: OSTI; NTIS (US Sales Only); INIS.

Charged particles emitted in the extreme forward direction can be detected in a particle telescope mounted inside the CELSIUS ring in one of the dipole magnets following the target. Results of a test with a plastic scintillator telescope are reported for $\alpha + H$ reactions at 1.7 and 2.2 GeV/c. The results are consistent with ray-trace calculations. Contributions in the spectrometer from background reactions and scattering in the beam tube are small. (au).

7474 (INIS-mf-14017) **Annealing of radiation damages in extrinsic semiconductor detectors with lead chalkogenide diode lasers. Final report.** Schiessl, U.P.; Tacke, M. Fraunhofer-Institut fuer Physikalische Messtechnik (IPM), Freiburg im Breisgau (Germany); Bundesministerium fuer Forschung und Technologie, Bonn (Germany). 1991 59p. (In German). Contract BMFT 511/DARA;BMFT 01RS89376. Order Number DE92750130. Source: OSTI; NTIS (US Sales Only); INIS.

Highly sensitive, extrinsic semiconductor detectors are used at cryogenic temperatures in infrared satellite telescopes for astronomical applications. Calibration and sensitivity of the detectors are changed by high-energy radiation in the earth orbit. Conventional annealing methods either induce high electric power dissipation or do not anneal all detectors uniformly and reliably. The research project had the task of proving the annealing of radiation damage with the aid of a novel optical method that on the one hand is expected to involve low power dissipation and on the other hand achieves a reliable annealing of all detectors. The detector to be annealed is irradiated with the IR radiation of a lead chalkogenide laser diode. Annealing could be proved successfully in especially critical detectors with low losses. On the basis of the achieved results, the technique can be developed to prototype maturity within the framework of a successor project. (orig.) With 5 refs., 17 tabs., 29 figs.

7475 (SAND–91-2705C) **Radiation compensated optically-triggered GaAs and Si thyristor switches.** Carson, R.F. Sandia National Labs., Albuquerque, NM (United States). [1991]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-920367–1: Department of Defense (DOD) fiber optics conference, McLean, VA (United States), 25 Mar 1992). Order Number DE92003950. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Optically-triggered thyristors are hardened to switching in high dose-rate transient x-ray environments by adding compensating photodetectors that are shielded from the light signal but are sensitive to ionizing radiation. Silicon thyristors are packaged with compensating photodiodes that reduce sensitivity to premature switching by transient radiation by a factor of 100. GaAs devices are monolithically integrated with a photo-transistor and are resistant to radiation-induced switching (or "upset") up to 2×10^9 [Rad (Si)/(sec)]. This is a factor of 10 increase in tolerance to upset over uncompensated two-terminal GaAs thyristors. 7 refs.

4404 Well Logging Instrumentation

7476 **Downhole hydraulic seismic generator.** Gregory, D.L.; Hardee, H.C.; Smallwood, D.O. To Dept. of Energy. 1990. Filed date 19 Apr 1990. USA Patent patent application 7-511,372. 21p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004602. Source: OSTI; NTIS; GPO Dep.

A downhole hydraulic seismic generator system for transmitting energy wave vibrations into earth strata surrounding a borehole. The system contains an elongated, unitary housing operably connected to a well head aboveground by support and electrical cabling, and contains clamping apparatus for selectively clamping the housing to the walls of the borehole. The system further comprises a hydraulic oscillator containing a double-actuating piston whose movement is controlled by an electro-servovalve regulating a high pressure hydraulic fluid flow into and out of upper and lower chambers surrounding the piston. The spent hydraulic fluid from the hydraulic oscillator is stored and pumped back into the system to provide high pressure fluid for conducting another run at the same, or a different location within the borehole. 4 figs.

7477 (Juel–2455) **Investigations for the suitability of photoelectrical aerosol sensors (PAS) as an instrument of the on-line and in-situ monitoring of combustion aerosols containing polycyclic aromatic hydrocarbon (PAH) and nitropolycyclic aromatic hydrocarbon (NPAH).** Zajc, A. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemische Technologie; Dortmund Univ. (Germany). Mar 1991. 105p. (In German). Order Number DE92758870. Source: OSTI; NTIS (US Sales Only).

The principle applicability of the Photoelectrical Aerosol Sensors (PAS) for on-line and in-situ detection of Polycyclic Aromatic Hydrocarbon (PAH) and Nitropolycyclic Aeomatic Hydrocarbon (NPAH) was proven in a laboratory fluidized bed combustion. In this case, statistically assured investigations could be performed with dodecane and heating fuel oil EL. For the combustion of waste oil, the results could solely be made for two measuring points on a secure statistical basis. Hence, indication could therefore be made that the sensor signal represents a function of the PAH emissions even in this extremely complex matrix. These investigations can, however, not verify the linear dependancy of the PAS signal from the PAH emissions during the combustion of waste oil. This linear relation can be assumed, however, based on the results in regard to the combustion of doecane and fuel oil EL, even for waste oil. (orig./BBR).

7478 (MLM–3714(OP)) **Heat distribution error in radiometric calorimeters.** Strohm, W.W. (EG and G Mound Applied Technologies, Miamisburg, OH (United States)); Perry, R.B. EG and G Mound Applied Technologies, Miamisburg, OH (United States). [1991]. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-910901–26: 4. international conference on facility operations/safeguards interface, Albuquerque, NM (United States), 29 Sep - 4 oct 1991). Order Number DE92004008. Source: OSTI; NTIS; GPO Dep.

Calorimetric assay of plutonium and tritium is an important and well characterized measurement. The discussion of heat distribution error for radiometric calorimeters in relevant consensus standards is adequate for existing water bath calorimeters since they have a relatively flat response profile throughout the sample chamber. The development of transportable dry calorimeters has resulted in instruments with response profiles showing larger variations. This work describes the approach used to determine the heat distribution error term in the error models for two transportable dry calorimeters and recommends that this approach be used for all radiometric calorimeters and included in appropriate consensus standards. 7 refs.

(EG and G Mound Applied Technologies, Miamisburg, OH (United States)); Renz, D.P.; James, S.J.; Duff, M.F.; Cremers, T.; Camp, K. EG and G Mound Applied Technologies, Miamisburg, OH (United States); Los Alamos National Lab., NM (United States). [1991]. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-910901–25: 4. international conference on facility operations/safeguards interface, Albuquerque, NM (United States), 29 Sep - 4 oct 1991). Order Number DE92004007. Source: OSTI; NTIS; GPO Dep.

The Dry Heat Exchanger Calorimeter System was developed by Mound as a calorimeter system that requires no water. The Los Alamos National Laboratory (LANAL) conducted a field test of the calorimeter system from November 1990 through February 1991. The results of this field test and a discussion of these results are presented here. The calorimeter system was tested with a variety of reference standards and actual samples, and the results were compared to the assay results of an existing water bath calorimeter at LANL. The standards were assayed with an average error of 0.20% and a standard deviation of 1.0%; whereas, the samples were assayed with an average error of 0.12% and a standard deviation of 0.8%. These results are in agreement with the results obtained during the Mound testing. 1 ref.

7480 **Triaxial thermopile array geo-heat-flow sensor.** Carrigan, C.R.; Hardee, H.C.; Reynolds, G.D.; Steinfort, T.D. To Dept. of Energy. 1990. Filed date 30 Apr 1990. USA Patent patent application 7-516,399. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004606. Source: OSTI; NTIS; GPO Dep.

A triaxial thermopile array geothermal heat flow sensor is designed to measure heat flow in three dimensions in a reconstituted or unperturbed subsurface regime. Heat flow can be measured in conductive or permeable convective media. The sensor may be encased in protective pvc tubing and includes a plurality of thermistors and an array of heat flow transducers produce voltage proportional to heat flux along the subsurface regime and permit direct measurement of heat flow in the subsurface regime. The presence of the thermistor array permits a comparison to be made between the heat flow estimates obtained from the transducers and heat flow calculated using temperature differences and Fourier's Law. The device is extremely sensitive with an accuracy of less than 0.1 Heat Flow Units (HFU) and may be used for long term readings. 6 figs.

7481 (DOE/ER/14045–5) **Microcomputer enhanced optical investigation of spreading and evaporative processes in ultra thin films: Progress report, January 1, 1991–December 31, 1991.** Wayner, P.C. Jr.; Liu, A.H. Rensselaer Polytechnic Inst., Troy, NY (United States). Dec 1991. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER14045. Order Number DE92005085. Source: OSTI; NTIS; GPO Dep.

The general objective of the research is to determine the heat transfer characteristics of evaporating ultra-thin films. The immediate objective is to develop a microscopic image-processing system (IPS) to measure the film thickness profile. The IPS has two parts: an image analyzing interferometer (IAI) and an image analyzing ellipsometer (IAE). An IAI was designed and used to measure the thickness profiles of an extended meniscus in the contact line region of completely wetting liquid films. Both steady state and oscillating menisci were studied. We find that the convenience and efficiency of mirocomputer enhanced video microscopy naturally leads to a better understanding of the transport processes in the contact line region. We also find that the processes of change-of-phase heat transfer and fluid flow in thin films are intrinsically connected because of their common dependence on the intermolecular force field. The design of an image analyzing ellipsometer (IAE) was completed and the system was successfully tested by measuring the thickness and refractive index profiles of various solid films of known thicknesses. The profile of draining isothermal films will be measured next.

7482 (DOE/ER/60925–T1) **Skeletal remodeling dynamics: New approaches with imaging instrumentation.** Parks, N.J.; Pinkerton, K.E.; Seibert, J.A.; Pool, R.R. California Univ., Davis, CA (United States). [1991]. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-90ER60925. Order Number DE92003752. Source: OSTI; NTIS; INIS; GPO Dep.

This report of progress and future objectives timetable is based on an included schematic of goals and objectives and the project abstract which is included as Appendix 1. Five matters are summarized in the order of (1) novel methods of calcified bone confocal microscopy and reconstruction image analysis of decalcified beagle and human cortical bone serial sections, (2) macroscopic cross-correlation of beagle and human cortical and cancellous bone fractions with CT analysis, (3) guidance to the most radiobiologically important skeletal regions of interest with the just completed ^{90}Sr bone tumor map from life time beagle studies, (4) deposition patterns of radioactive agents that participate in apatite crystal nucleation processes in bone and leave radiation-excited electrons trapped in bone mineral, and (5) the budget period timetable. The discovery that beta particles from ^{166}Ho ($T_{\frac{1}{2}}$ =26 hr, β_{max} = 1.8 MeV) phosphonic acid bone agents leave detectable, long-lived, electron paramagnetic resonance signals in bone is included in Appendix 2 as a joint report.

7483 (DOE/ER/61085–1) **[Nanometer scale exciton spectroscopy and photochemistry: Dynamic imaging of DNA structure-activity relations and radiation signatures]: Progress report, September 24, 1990–July 24, 1991.** Kopelman, R. Michigan Univ., Ann Arbor, MI (United States). [1991]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-90ER61085. Order Number DE92004016. Source: OSTI; NTIS; GPO Dep.

We have constructed a scanning near-field optical microscope. For this we developed subwavelength micropipette light sources containing photostable crystal tips. We have also developed a technique for pulling and metal coating for single mode optical fibers to give nanometer silica tips emitting polarized laser light. Clear images have been obtained of polymeric porous membranes with nanometer pore sizes of comparable quality to that of scanning electron microscopy, but without the need for a vacuum. This method is aimed at both transmission and fluorescence nanoscopy. We believe that at least one of these will be operational in the coming year. We have also made significant progress on the next stage: Scanning, Tunneling, Exciton Microscopy. This is based on direct energy transfer between the tip and the particular molecule or fluorophore in the sample. We expect this stage to be operational in the third year of the project. Preliminary near-field optical scans indicate our resolution is already in the nanometer range. 3 figs. (MHB)

7484 (ENEA-RT-AMB–90-47) **Single particle laser light scattering analyzer: Simulated performance.** Neri, E.; Mazzacurati, V.; Platini, M. ENEA, Casaccia (Italy). Area Energia, Ambiente e Salute; Rome Univ. (Italy). Dipt. di Fisica. Jun 1991. 14p. (RT/AMB–90-47). Order Number DE92744022. Source: OSTI; NTIS (US Sales Only).

This paper presents a laser light scattering apparatus which measures the physical characteristics of a filter testing aerosol in its actual flow by analyzing simultaneously the intensity of the light scattered at different angles by each particle passing through an optically defined scattering volume. Both size and refractive index may be obtained provided that the incoming light flux is kept constant, within 15%, inside the scattering volume. The complete simulation of the optical apparatus was performed by supposing that only one particle at a time is analyzed and that the particles are spherical, thus allowing the Mie theory to model their scattering behaviour. Particle size, complex refractive index (real and imaginary part), and light flux incident onto the particle were considered as the four variables. Preliminary trial runs, performed with the aim of determining the minimum number of collecting angles necessary to obtain the convergence of fitting procedure to the expected values of the unknown parameters, showed that this convergence could be only occasionally obtained even if up to 10 collecting angles had been adopted. This occurrence demonstrated the existence of a strong correlation between the four parameters. Subsequent runs performed for non-conductive materials gave, on the contrary, better results.

7485 (ENEA-RT-INN–90-52) **Optical cell for variable temperature molecular spectroscopic measurement.** Baldacchini, G.; Bellatreccia, A.; Cardoni, P.; Cenciarelli, I.; D'Amato, F.; Giovagnoli, R.; Baltussen, J. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Apr 1991. 12p. (In Italian). (RT/INN–90-52). Order Number DE92744023. Source: OSTI; NTIS (US Sales Only).

This paper reports on the design and construction of a 20 cm long optical cell whose temperature can be changed continuously between 50 and 350 degrees K. The cell is cooled by a single stage cryogenerator and thermo-regolated with an electrical feedback system within 5 degrees K or better. The system will be used for measurements of molecular spectroscopy at high resolution by the use of tunable diode lasers.

7486 (LAMP–91/5) **Introduction to optical fiber sensors.** LAMP series report (Laser, Atomic and Molecular Physics). Moukdad, S. International Centre for Theoretical Physics, Trieste (Italy). Jun 1991. 14p. Order Number DE92611161. Source: OSTI; NTIS (US Sales Only); INIS.

Optical fiber sensors have many advantages over other types of sensors, for example: Low weight, immunity from EMI, electrical isolation, chemical passivity, and high sensitivity. In this seminar, a brief explanation of the optical fiber sensors, their use, and their advantages will be given. After, a description of the main optical fiber sensor components will be presented. Principles of some kinds of optical fiber sensors will be presented, and the principle of the fiber-optic rotation sensor and its realization will be discussed in some details, as well as its main applications. (author). 5 refs, 8 figs, 2 tabs.

7487 **Fiber optic detector.** Partin, J.K.; Ward, T.E.; Grey, A.E. To Dept. of Energy. 1990. Filed date 30 Apr 1990. USA Patent patent application 7-516,590. 22p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE92004609. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a portable fiber optic detector that senses the presence of specific target chemicals by exchanging the target chemical for a fluorescently-tagged antigen that is bound to an antibody which is in turn attached to an optical fiber. Replacing the fluorescently-tagged antigen reduces the fluorescence so that a photon sensing detector records the reduced light level and activates an appropriate alarm or indicator.

7488 **Detection device for hazardous material.** Partin, J.K.; Grey, A.E. To Dept. of Energy. 1990. Filed date 4 Apr 1990. USA Patent patent application 7-504,218. 21p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE92003839. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a detection device that is activated by the interaction of a hazardous chemical with a coating interactive with said chemical on an optical fiber thereby reducing the amount of light passing through the fiber to a light detector. A combination of optical filters separates the light into a signal beam and a reference beam which after detection, appropriate amplification, and comparison with preset internal signals, activates an alarm means if a predetermined level of contaminant is observed.

7489 Laser metrology for coherent multi-telescope arrays. Shao, M.; Massie, N.A. To Dept. of Energy. 1990. Filed date 16 May 1990. USA Patent patent application 7-524,114. 39p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92004616. Source: OSTI; NTIS; GPO Dep.

In multi-telescope arrays that comprise multiple telescopes, a beam-combining module, and flat mirrors for directing light beams from the multiple telescopes to the beam combining module, a laser metrology system is used for monitoring various pathlengths along a beam path where deviations are likely. Some pathlengths are defined simply by a pair of retroreflectors or reflectors at both ends. Lengths between pairs of retroreflectors are measured and monitored by laser interferometers. One critical pathlength deviation is related to the displacement of the flat mirror. A reference frame is set up relative to the beam-combining module to form and define the coordinate system within which the positions of the flat mirrors are measured and monitored. In the preferred embodiment, a pair of retroreflectors along the optical axis of the beam-combining module defines a reference frame. A triangle is formed by the reference frame as the base and another retroreflector at the flat mirror as the vertex. The triangle is used to monitor the position of the flat mirror. A beam's pathlength is dynamically corrected in response to the monitored deviations.

7490 High resolution telescope. Massie, N.A.; Oster, Y. To Dept. of Energy. 1990. Filed date 16 May 1990. USA Patent patent application 7-524,118. 39p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92004617. Source: OSTI; NTIS; GPO Dep.

A large effective-aperture, low-cost optical telescope with diffraction-limited resolution enables ground-based observation of near-earth space objects. The telescope has a non-redundant, thinned-aperture array in a center-mount, single-structure space frame. It employs speckle interferometric imaging to achieve diffraction-limited resolution. The signal-to-noise ratio problem is mitigated by moving the wavelength of operation to the near-IR, and the image is sensed by a Silicon CCD. The steerable, single-structure array presents a constant pupil. The center-mount, radar-like mount enables low-earth orbit space objects to be tracked as well as increases stiffness of the space frame. In the preferred embodiment, the array has elemental telescopes with subaperture of 2.1m in a circle-of-nine configuration. The telescope array has an effective aperture of 12m which provides a diffraction-limited resolution of 0.02 arc seconds. Pathlength matching of the telescope array is maintained by an electro-optical system employing laser metrology. Speckle imaging relaxes pathlength matching tolerance by one order of magnitude as compared to phased arrays. Many features of the telescope contribute to substantial reduction in costs. These include eliminating the conventional protective dome and reducing on-site construction activities. The cost of the telescope scales with the first power of the aperture rather than its third power as in conventional telescopes. 9 figs., 1 tab.

7491 Solid colloidal optical wavelength filter. Alvarez, J.L. To Dept. of Energy. 1990. Filed date 30 May 1990. USA Patent patent application 7-530,673. 16p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE92003980. Source: OSTI; NTIS; GPO Dep.

The present invention relates generally to techniques and methods to filter optical wavelengths for spectroscopy, protection from intense radiation, monochromatizing, and analyzing optical radiation, and more particularly to a solid colloidal rejection filter and a method for constructing a solid colloidal rejection filter. A solid colloidal optical wavelength filter includes a suspension of spherical particles dispersed in a coagulable medium such as a setting plastic. The filter is formed by suspending spherical particles in a coagulable medium; agitating the particles and coagulable medium to produce an emulsion of particles suspended in the coagulable medium; and allowing the coagulable medium and suspended emulsion of particles to cool. 3 figs.

7492 Method for eliminating artifacts in CCD imagers. Turko, B.T.; Yates, G.J. To Dept. of Energy. 1990. Filed date 29 Jun 1990. USA Patent patent application 7-545,732. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098 ;W-7405-ENG-48. Order Number DE92003816. Source: OSTI; NTIS; GPO Dep.

An electronic method for eliminating artifacts in a video camera (10) employing a charge coupled device (CCD) (12) as an image sensor. The method comprises the step of initializing the camera (10) prior to normal read out and includes a first dump cycle period (76) for transferring radiation generated charge into the horizontal register (28) while the decaying image on the phosphor (39) being imaged is being integrated in the photosites, and a second dump cycle period (78), occurring after the phosphor (39) image has decayed, for rapidly dumping unwanted smear charge which has been generated in the vertical registers (32). Image charge is then transferred from the photosites (36) and (38) to the vertical registers (32) and read out in conventional fashion. The inventive method allows the video camera (10) to be used in environments having high ionizing radiation content, and to capture images of events of very short duration and occurring either within or outside the normal visual wavelength spectrum. Resultant images are free from ghost, smear and smear phenomena caused by insufficient opacity of the registers (28) and (32), and are also free from random damage caused by ionization charges which exceed the charge limit capacity of the photosites (36) and (37).

7493 (UCRL–53868-90, pp. 8.1-8.8) **Atmospheric-compensated imaging systems.** Lawrence, T.W.; Goodman, D.M. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors have developed and implemented a new technology for removing the effects of atmospheric turbulence from telescope images. This technology - bispectral speckle interferometry - permits imaging of astronomical objects and satellites to the diffraction limit of the collecting telescope. They have successfully applied this technique to speckle images obtained with a 1.6-m telescope at the Air Force Maui Optical Station on Mt. Haleakala, Maui. They have extracted diffraction-limited features of several satellites, including the Hubble Space Telescope. In addition, they are developing novel, inexpensive wavefront sensor and adaptive optic architectures that can be used for imaging applications, laser beam cleanup, and optical correlography. These technologies should have positive impacts on both astronomical and defense imaging problems.

7494 (UCRL-CR–108117) **Lawrence Livermore National Laboratory Kestrel IV Pointing and Tracking System preliminary design.** Shepherd, O.; Aurilio, G.; Bucknam, R.D. Lawrence Livermore National Lab., CA (United States); Visidyne, Inc., Burlington, MA (United States). 9 Nov 1990. 89p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (VI–1600A). Order Number DE92003985. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This is a technical report documenting the work performed under LLNL Subcontract B116800. This effort consisted of the development of a preliminary design of the KESTREL IV Pointing and Tracking System. This design consists of the payload azimuth bearing assembly, telescope and pointing mirror optics, telescope to payload mounting interface, coarse and fine azimuth and elevation servo systems, and the payload power system. As part of this design three innovative design approaches were developed which could result in a significant payload weight reduction. These were: (1) A pointing system using a pointed telescope which eliminates the requirement for a large gimballed pointing mirror. (2) A light weight pointing mirror which reduces the size of the fine azimuth/elevation gimbal required. (3) The use of primary lithium batteries to significantly reduce the payload battery weight. After the designs submitted in this report are evaluated, and approved by LLNL, the detail drawings can be generated for the azimuth bearing assembly and telescope mass simulator. These assemblies can be fabricated, assembled, and tested at Visidyne, Inc. and then shipped to LLNL where they could be integrated with a test payload. This test payload would then be tested for parachute opening shock and water entry.

7495 (UCRL-CR–108459) **Correlator optical wavefront sensor "COWS," Task 6: Final report.** Lawrence Livermore National Lab., CA (United States); Phillips Lab., Kirtland AFB, NM (United States); Schafer (W.J.) Associates, Inc., Albuquerque, NM (United States). 6 Feb 1991. 43p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92003964. Source: OSTI; NTIS; GPO Dep.

This report documents the significant upgrades and improvements made to the COWS optical bench during this phase of the program. Software for the experiment was reviewed and documented. Flowcharts showing the program flow are included as well as documentation for programs which were written to calculate and display Zernike polynomials. The system was calibrated and aligned and a series of experiments to determine the optimum settings for the input and output MOSLM polarizers were conducted. In addition, design of a simple aberration generation is included.

7496 (UCRL-JC–107983) **Fast, inexpensive, diffraction limited cylindrical microlenses.** Synder, J.J.; Reichert, P. Lawrence Livermore National Lab., CA (United States). 8 Jul 1991. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9107115–61: Society of Photo-Optical Instrumentation Engineers (SPIE) meeting, San Diego, CA (United States), 21-26 Jul 1991). Order Number DE92003972. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed a technique for fabricating fast, well corrected cylindrical microlenses. With this technique we have made a number of different microlenses with dimensions and focal lengths in the range of few hundred μm, and diffraction limited numerical apertures as high as 0.9. The microlenses are specifically designed for applications where they can increase the radiance or otherwise enhance the optical characteristics of laser diode light. The fabrication method we use is very versatile, and the microlenses produced this way would be very inexpensive in production quantities. 6 refs., 4 figs.

7497 (UCRL-JC–108740) **Speckle imaging of satellites at the Air Force Maui Optical Station.** Lawrence, T.W.; Goodman, D.M.; Johansson, E.M.; Fitch, J.P. Lawrence Livermore National Lab., CA (United States). Oct 1991. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9110296–1: European Southern Observatory (ESO) conference on high resolution imaging by interferometry II, Garching (Germany), 14-18 Oct 1991). Order Number DE92004668. Source: OSTI; NTIS; GPO Dep.

We performed a series of experiments using the Air Force Maui Optical Station's 1.6 m telescope and a bare CCD detector to capture speckle images of various satellites. The speckle images were processed with bispectral techniques for recovering image Fourier phase as well as projection onto convex sets for recovering image Fourier magnitude from the projected autocorrelation. Results of imaging point stars and binaries are shown as a baseline assessment of our techniques. We have reconstructed high quality images of numerous satellites and will show reconstructions of a very familiar satellite: the Hubble Space Telescope. To our knowledge, this is the first demonstration of the use of bare CCDs for speckle imaging of relatively bright objects such as artificial satellites. 13 refs.

7498 (ANL/CP–74079) **Misalignment sensitivity of an inclined crystal monochromator.** Macrander, A.T.; Lee, W.K. Argonne National Lab., IL (United States). Oct 1991. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9110146–3: 7. national conference and exhibition on synchrotron radiation instrumentation, Baton Rouge, LA (United States), 28-31 Oct 1991). Order Number DE92004130. Source: OSTI; NTIS; GPO Dep.

The sensitivity of a novel inclined crystal monochromator design to misalignments has been calculated, and compared to data. Rocking curve line narrowing as well as broadening can occur because the asymmetry factor of dynamical diffraction given by $b=s_O \cdot n/s_H \cdot n$ can have an absolute value larger or smaller than unity. Here $s_O \cdot n$ and $s_H \cdot n$ are the direction cosines of the incident and diffracted beams, respectively, and n is the inward surface normal. An inclined double crystal monochromator which is perfectly aligned would have $b = -1$ for both crystals, and only then would the diffraction by symmetric. We have computed b and rocking curve widths for inclination angles of 70.53° and 85.00°, and we compare the 70.53° case to data for silicon {111} reflections using 8 KeV (CuK_{α_1}) radiation. The 70.53° case applies to $(11\bar{1})$ reflection from a (111) oriented crystal. We report that rotations around the reciprocal lattice vector have the expected effect on b.

7499 (CONF-911132–8) **Atomic force microscopy of DNA strands adsorbed on mica: The effect of humidity on apparent width and image contrast.** Thundat, T. (Oak Ridge National Lab., TN (United States)); Warmack, R.J.; Allison, D.P.; Lourenco, A.J.; Ferrell, T.L.; Bottomley, L.A. Oak Ridge National Lab., TN (United States). [1991]. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 38. national symposium of the American Vacuum Society; Seattle, WA (United States); 11-15 Nov 1991. Order Number DE92004404. Source: OSTI; NTIS; GPO Dep.

We investigated the effect of relative humidity on the apparent width and contrast of isolated strands of DNA imaged with atomic force microscopy (AFM). Due to convolution of the tip with DNA, the apparent width of DNA molecules observed with AFM was broader than the known width of DNA. Also, the apparent width of DNA increased with increasing humidity while the contrast of the DNA images decreased with increasing humidity. This phenomena is completely reversible and can be attributed to non-normal forces causing a buckling of AFM cantilever. 20 refs., 4 figs.

7500 (CONF-9109230–8) **Algorithm for a novel fiber-optic weigh-in-motion sensor system.** Tobin, K.W. Jr.; Muhs, J.D. Oak Ridge National Lab., TN (United States). Aug 1991. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From SPIE meeting; Boston, MA (United States); 3-6 Sep 1991. Order Number DE92003538. Source: OSTI; NTIS; GPO Dep.

Over the past decade, the demand from both government and private industry for small, lightweight, vehicle weigh-in-motion (WIM) systems has grown substantially. During the 1980s several techniques for weighing vehicles in motion were developed that include piezoelectric cables, capacitive mats, and hydraulic and bending-plate load cells. These different systems have advantages and disadvantages that trade off between accuracy, physical size and system complexity. The smaller portable systems demonstrate medium to poor accuracy and repeatability while the larger more accurate systems are nonportable. A small, lightweight, and portable WIM system based on a fiber-optic pressure transducer has been developed by Oak Ridge National Laboratory (ORNL) to meet the demands of government and industry. The algorithm for extracting vehicle weight from the time-dependent sensor response is developed and presented in this report, along with data collected by the system for several classes of vehicles. These results show that the ORNL fiber-optic WIM system is a viable alternative to other commercial systems that are presently available. 5 refs., 5 figs.

7501 (DOE/ER/60642–4) **Positron ring system using anger-type detectors: Progress report, February 15, 1991–February 14, 1992.** Karp, J.S. Pennsylvania Univ., Philadelphia, PA (United States). 15 Nov 1991. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER60642. Order Number DE92004052. Source: OSTI; NTIS; INIS; GPO Dep.

The major accomplishments of this year include (1) building and debugging a new set of coincidence electronics for our laboratory setup, (2) performing a series of detector experiments in the dry glove-box aimed at improving the performance of NaI(Tl) position-sensitive detectors, (3) modifying and debugging a Monte Carlo simulation code to test reconstruction algorithms and predict overall performance of a large solid angle PET scanner, (4) significant progress in the 3-D reprojection reconstruction algorithm and comparison to the 2-D single-slice algorithm and a 3-D multi-slice rebinning algorithm, (5) performance comparisons of the two PENN-PET scanners, which lead to a design for a large solid angle scanner with a 25-cm axial extent.

7502 (JINR-R--10-90-335) **A set of blocks for time measurements developed in the Laboratory of Nuclear Problems, JINR.** Grebenyuk, V.M.; Selikov, A.V. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems. 1990. 12p. (In Russian). Order Number DE92611157. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the Organizing Committee of the 14-th Intern. Symp. on Nucl. Electronics, September 1990, Warsawa.

The paper briefly describes the block for time measurements made to the CAMAC standard. They are: two-channel converter KA304, multistop converters KA326, KA330, KA393, quartz generator KB311, generator of pulses randomly distributed in time KA316 and 'Start-Stop' generator KA333. The above devices are manufactured by the Experimental Workshop of JINR and are effectively used at the experimental facilities of LNP and at the work stations of electronic equipment designers. 9 refs.; 8 figs.

7503 (JINR-R--10-90-398) **Microprocessor controller in CAMAC standard for temperature regulation and stabilization.** Nguen N'i D'en; Rodionov, K.G. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics. 1990. 11p. (In Russian). Order Number DE92611158. Source: OSTI; NTIS (US Sales Only); INIS.

The microprocessor controller in CAMAC standard for temperature regulation and stabilization of an external object (electric furnance, thermostat) is described. The controller has two control regimes - parallel and serial regimes and has been controlled by personal computer PC/XT/AT. The apparatus that has been created and software supply allow linearly to raise or to lower temperature of samples to indicated value with different rates, to stabilize temperature on a level is set, to record a graph of current temperature both at time of heating or cooling down and at time of stabilization with different frequency that is set by the program. 3 refs.; 3 figs.

7504 (JINR-R--13-90-400) **Automatic proton resonance magnetometer up to 6 T.** Ivashkevich, S.A.; Lagish, J. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems. 1990. 6p. (In Russian). Order Number DE92611159. Source: OSTI; NTIS (US Sales Only); INIS.

A nuclear magnetic resonance magnetometer with automatic signal search and field tracking is described. The magnetometer serves for measurements of the plane gap magnet fields, as well as the solenoid fields. The range of the measured fields is 0.06-6 T. The proton resonance is used throughout the whole field range. The permissible inhomogeneity of the measured field is 0.5% cm^{-1}, the measurement error being 0.01%. The probe is connected with the rest part of the magnetometer and frequency meter by cables up to several tens of meters long, which allows to distant fiel measurements. 4 refs.; 1 fig.; 1 tab.

7505 (LBL--30456) **Varied line-space gratings and applications.** McKinney, W.R. Lawrence Berkeley Lab., CA (United States). 15 Jul 1991. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-910730--25: 4. international conference on synchrotron radiation instrumentation, Chester (United Kingdom), 15-19 Jul 1991). Order Number DE92003902. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a straightforward analytical and numerical method for the design of a specific type of varied line-space grating system. The mathematical development will assume plane or nearly-plane spherical gratings which are illuminated by convergent light, which covers many interesting cases for synchrotron radiation. The gratings discussed will have straight grooves whose spacing varies across the principal plane of the grating. Focal relationships and formulae for the optical grating-pole-to-exist-slit distance and grating radius previously presented by other authors will be derived with a symbolic algebra system. It is intended to provide the optical designer with the tools necessary to design such a system properly. Finally, some possible advantages and disadvantages for application to synchrotron to synchrotron radiation beamlines will be discussed.

7506 (LBL--31121) **Atomic force microscopy images of T4 bacteriophages on silicon substrates.** Kolbe, W.F.; Ogletree, D.F.; Salmeron, M.B. Lawrence Berkeley Lab., CA (United States). Aug 1991. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-9108153--2: 1991 scanning tunneling microscopy, Interlaken (Switzerland), 12-16 Aug 1991). Order Number DE92004159. Source: OSTI; NTIS; GPO Dep.

A new atomic force microscope incorporating microfabricated cantilevers and employing laser beam deflection for force detection has been constructed and is being applied to studied of biological material. In this study, T4 bacteriophage virus particles were deposited from solution onto electronic grade flat silicon wafers and imaged in air with the microscope. Microliter droplets of the solution were deposited and either allowed to dry or removed with blotting paper. The images show both isolated viruses and aggregates of various sizes. The external structure as well as strands believed to be DNA streaming out of the virus could be observed. The construction of the microscope and its performance are also described. 19 refs., 4 figs.

7507 (ORNL/TM--12005) **Atom probe field ion microscopy and related topics: A bibliography 1990.** Russell, K.F.; Miller, M.K. Oak Ridge National Lab., TN (United States). Dec 1991. 43p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92005518. Source: OSTI; NTIS; GPO Dep.

This bibliography includes references related to the following topics: atom probe field ion microscopy (APFIM), field ion microscopy (FIM), field emission (FE), ion sources, and field desorption mass microscopy (FDMM). Technique-orientated studies and applications are included. The bibliography covers the period 1990. The references contained in this document were compiled from a variety of sources including computer searches and personal lists of publications. To reduce the length of this document, the references have been reduced to the minimum necessary to locate the articles. The references, listed alphabetically by authors, are subdivided into the categories listed in paragraph one above. An Addendum of references missed in previous bibliographies is included.

7508 **Fiber optic geophysical sensors.** Homuth, E.F. To Dept. of Energy. 1990. Filed date 10 Apr 1990. USA Patent patent application 7-506,741. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92003875. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a fiber optic geophysical sensor in which laser light is passed through a sensor interferometer in contact with a geophysical event, and a reference interferometer not in contact with the geophysical event but in the same general environment as the sensor interferometer. In one embodiment, a single tunable laser provides the laser light. In another embodiment, separate tunable lasers are used for the sensor and reference interferometers. The invention can find such uses as monitoring for earthquakes, and the weighing of objects. 2 figs.

7509 **Design and implementation of a dc-based magnetic field controller.** Kotter, D.K.; Rankin, R.A.; Morgan, J.P. To Dept. of Energy. 1990. Filed date 14 May 1990. USA Patent patent application 7-522,877. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-84ID12435. Order Number DE92004615. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a magnetic field controller for laboratory devices and in particular to dc operated magnetic field controllers for mass spectrometers, comprising a dc power supply in combination with improvements to a hall probe subsystem, display subsystem, preamplifier, field control subsystem, and an output stage. 1 fig.

7510 **Convergent x-ray monochromator for molecular microprobe analysis.** Gamba, O.O.M. To Dept. of Energy. 1990. Filed date 29 May 1990. USA Patent patent application 7-529,403.

19p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC11-89PN38014. Order Number DE92004619. Source: OSTI; NTIS; GPO Dep.

An improved apparatus and method are provided for electron spectroscopy for chemical analysis which permits analysis of micron sized regions of a heterogeneous sample surface. The apparatus includes a source of multidirectional X-ray radiation. A hollow cylindrical body receives the multidirectional X-ray radiation. The hollow cylindrical body includes a plurality of beam directing Johannsen-type diffracting crystals elements arrayed symmetrically and circumferentially around an axis of symmetry extending from the source of X-ray radiation to a surface of the sample. The array of Johannsen-type diffracting crystals transforms the multidirectional X-ray radiation into a hollow cone of monochromatic X-ray radiation that converges on a micron sized region on the sample surface. A screen opaque to X-rays is located along the axis of symmetry between the source of X-ray radiation and the sample. The screen prevents X-rays from the source from reaching the sample without being directed and diffracted by the beam directing and diffracting elements. An electron detector located along the axis of symmetry detects electrons emitted from the micron sized region of the sample surface. The electron detector is located between the X-ray screen and the sample surface. 4 figs.

7511 Method and apparatus for measuring surface contour on parts with elevated temperatures. Horvath, M.S.; Nance, R.A.; Cohen, G.H.; Fodor, G.E. To Dept. of Energy. 1990. Filed date 31 May 1990. USA Patent patent application 7-531,356. 18p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC11-76PN00014. Order Number DE92003662. Source: OSTI; NTIS; GPO Dep.

The invention is directed to a method and apparatus for measuring the surface contour of a test piece, such as the bow of a radioactive fuel rod, which is completely immersed in water. The invention utilizes ultrasonic technology and is capable of measuring surface contours of test pieces which are at a higher temperature than the surrounding water. The presence of a test piece at a higher temperature adversely affects the distance measurements by causing thermal variations in the water near the surface of the test piece. The contour measurements depend upon a constant temperature of the water in the path of the ultrasonic wave to provide a constant acoustical velocity (the measurement is made by the time of flight measurement for an ultrasonic wave). Therefore, any variations of water temperature near the surface will introduce errors degrading the measurement. The present invention overcomes these problems by assuring that the supply of water through which the ultrasonic waves travel is at a predetermined and constant temperature. 3 figs.

7512 Method and apparatus for acoustic plate mode liquid-solid phase transition detection. Blair, D.S.; Frye, G.C.; Hughes, R.C.; Martin, S.J.; Ricco, A.J. To Dept. of Energy. 1990. Filed date 31 May 1990. USA Patent patent application 7-531,492. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92003778. Source: OSTI; NTIS; GPO Dep.

A method and apparatus for sensing a liquid-solid phase transition event is provided which comprises an acoustic plate mode detecting element placed in contact with a liquid or solid material which generates a high-frequency acoustic wave that is attenuated to an extent based on the physical state of the material in contact with the detecting element. The attenuation caused by the material in contact with the acoustic plate mode detecting element is used to determine the physical state of the material being detected. The method and device are particularly suited for detecting conditions such as the icing and deicing of wings of an aircraft. In another aspect of the present invention, a method is provided wherein the adhesion of a solid material to the detecting element can be measured using the apparatus of the invention. 3 figs.

7513 Fiber-optic voltage sensor. Wood, C.B. To Dept. of Energy. 1990. Filed date 12 Jul 1990. USA Patent patent application 7-551,834. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP03533. Order Number DE92003823. Source: OSTI; NTIS; GPO Dep.

A fiber optic voltage sensor is described which includes a source of light, a reference fiber for receiving a known percentage of the light and an electrostrictive element having terminals across which is applied, a voltage to be measured. The electrostrictive element is responsive to the applied voltage to assume an altered physical state. A measuring fiber also receives a known percentage of light from the light source and is secured about the electrostrictive element. The measuring fiber is provided with a cladding and exhibits an evanescent wave in the cladding. The measuring fiber has a known length which is altered when the electrostrictive element assumes its altered physical state. A differential sensor is provided which senses the intensity of light in both the reference fiber and the measuring fiber and provides an output indicative of the difference between the intensities.

7514 (SAND-91-2303C) **Development of a high-accuracy motion compensation, pointing, and stabilization system for a synthetic aperture radar.** Fellerhoff, J.R.; Kohler, S.M. Sandia National Labs., Albuquerque, NM (United States). [1991]. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-920351-1: 1992 IEEE position, location and navigation symposium, Monterey, CA (United States), 24-27 Mar 1992). Order Number DE92002361. Source: OSTI; NTIS (US Sales Only); GPO Dep.

An advanced synthetic Aperture Radar Motion Compensation System has been developed by Sandia National Labs (SNL). The system includes a miniaturized high accuracy ring laser gyro inertial measurement unit, a three axis gimbal pointing and stabilization assembly, a differential Global Positioning System (GPS) navigation aiding system, and a pilot guidance system. The system provides unique improvements over previous SNL motion compensation systems and is capable of antenna stabilization to less than 0.01 degrees RMS, absolute antenna velocity measurements to less than 0.1 m/s RMS, and absolute position measurement to less than 5.0 meters RMS. These accuracies have been demonstrated in recent flight testing aboard a DHC-6-300 "Twin Otter" aircraft. 11 figs.

7515 (SAND-91-2376C) **Combined VISAR and flash x-ray testing techniques.** Sanchez, D.H. (Sandia National Labs., Albuquerque, NM (United States)); Lanoue, J.C.; Lare, G.A. Sandia National Labs., Albuquerque, NM (United States). [1991]. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9110282-2-Vugraphs: 16. annual joint firing set conference, Livermore, CA (United States), 15-17 Oct 1991). Order Number DE92004732. Source: OSTI; NTIS (US Sales Only); GPO Dep.

We have developed an experimental facility that provides simultaneous imaging of flyer plates with measurement of flyer velocity. This system allows us to test both explosive and electrically-driven flyers over a temperature range of −54° to +74°C. Our Velocity Interferometer System for Any Reflector (VISAR) is capable of measuring flyer velocities from 0.5 to 6 nm/μs. The flash x-ray system allows recording images of flyers with a minimum thickness of 0.05 mm and a minimum diameter of 0.002 inches.

7516 (UCRL-53868-90, pp. 7.9-7.13) **Fieldable sensor systems for environmental contaminants.** McKinley, B.J.; McCue, H.K.; Milanovich, F.P.; Angel, M.S. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors objective is to develop diagnostic instruments to measure the levels of a variety of physical and chemical contaminants in the field. There are two phases to this project: To assess and prioritize the needs for new environmental measurement systems, and then to develop complete fieldable instruments. They have completed the first phase, and find a widespread need for chemical sensors to measure contaminant levels in liquids and gases, and on solid surfaces. They have selected Raman spectroscopy as the first system for development due to its wide applicability.

7517 (ORNL–6684) **Navy Mobility Fuels Forecasting System report: Navy fuel production in the year 2000.** Hadder, G.R.; Davis, R.M. Oak Ridge National Lab., TN (United States). Sep 1991. 41p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. Order Number DE92004599. Source: OSTI; NTIS; GPO Dep.

The Refinery Yield Model of the Navy Mobility Fuels Forecasting System has been used to study the feasibility and quality of Navy JP-5 jet fuel and F-76 marine diesel fuel for two scenarios in the year 2000. Both scenarios account for environmental regulations for fuels produced in the US and assume that Eastern Europe, the USSR, and the People's Republic of China have free market economies. One scenario is based on business-as-usual market conditions for the year 2000. The second scenario is similar to first except that USSR crude oil production is 24 percent lower. During lower oil production in the USSR., there are no adverse effects on Navy fuel availability, but JP-5 is generally a poorer quality fuel relative to business-as-usual in the year 2000. In comparison with 1990, there are two potential problems areas for future Navy fuel quality. The first problem is increased aromaticity of domestically produced Navy fuels. Higher percentages of aromatics could have adverse effects on storage, handling, and combustion characteristics of both JP-5 and F-76. The second, and related, problem is that highly aromatic light cycle oils are blended into F-76 at percentages which promote fuel instability. It is recommended that the Navy continue to monitor the projected trend toward increased aromaticity in JP-5 and F-76 and high percentages of light cycle oils in F-76. These potential problems should be important considerations in research and development for future Navy engines.

7518 (ORNL/TM–11933) **Successful Army National Guard units: A guard perspective.** Wolfe, A.K. (Oak Ridge National Lab., TN (United States)); Saulsbury, J.W.; Schexanayder, S.M. Oak Ridge National Lab., TN (United States). Oct 1991. 59p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. Order Number DE92004593. Source: OSTI; NTIS; GPO Dep.

For National Guard Bureau, Falls Church, VA.

This project sought to identify factors contributing to a healthy Army National Guard (ARNG) unit. Its results were intended to contribute to a computerized forecasting model under development at Oak Ridge National Laboratory. The model, the ARNG Regional Recruiting Potential Model (RRPM), forecasts locations of successful new or modified Guard units. The study was expected to enhance the understanding of what constituents a healthy Guard unit. A Delphi approach was used to define criteria for healthy Guard units and to elicit rankings of those criteria. Two sets of telephone interviews were conducted with a sample of 102 individuals-two battalion-level administrative officers, or their equivalents, in each state in Washington, DC. During these telephone calls, the phrase "unit supportability" was used to express the notion of a healthy unit. The first set of interviews obtained background information and respondents' ideas of the criteria that lead to unit supportability and to a lack of supportability. The data were analyzed to develop a list of ten criteria for unit supportability. In the second interview, the same respondents were asked to rank those criteria in order of importance.

7519 (SAND–91-0955) **Radar-cross-section measurement errors caused by test object interaction with low-dielectric-constant supports.** Brock, B.C.; Patitz, W.E.; Sorensen, K.W.; Zittel, D.H. Sandia National Labs., Albuquerque, NM (United States). Aug 1991. 27p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004758. Source: OSTI; NTIS; GPO Dep.

In the search for an ideal test-object support for simulated free-space radar-cross-section (RCS) measurements, low-density polystyrene foam has achieved considerable popularity. However, significant error can be introduced into a measurement by the use of an inappropriately designed support. Although low back-scatter radar cross section (RCS) can be obtained with this material, interactions can occur between the test object and the mount which will cause measurement errors in excess of several dB. We present results of measurements performed on a simple test object supported on a low-density foam column which demonstrate this effect. As we discuss, this error can be incorrectly interpreted to be caused by poor mechanical alignment of the test object with the radar-range coordinate system. We discuss trade-offs associated with the choice between electrical and mechanical boresighting of the test object. Finally, we show that the error can be explained by differential propagation effects. In addition, this simple theory provides the insight necessary to devise appropriate measures to minimize the errors caused by the presence of the support. 4 refs., 6 figs.

7520 (UCRL–53868-90, pp. 8.12-8.16). **Radar ocean imaging.** Fitch, J.P.; Brase, J.M.; Yorkey, T.J. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The field of non-acoustic antisubmarine warfare (ASW), and in particular, the use of radar ocean iamging for submarine detection has received renewed attention over the past several years for a variety of reasons. These reasons include: (1) the strategic importance that any breakthrough in detection capability would signify, (2) the decreased performance of acoustic detection techniques due to recent improvements in submarine quieting, and (3) indications of major Soviet research and development activity in the area of radar ocean imaging. The authors are investigating the use of radar imaging to study ocean surface effects resulting from ship-generated internal waves. Their research offers potential application to non-acoustic antisubmarine warfare.

7521 (UCRL–53868-90, pp. 8.9-8.11) **Automatic target recognition.** Clark, G.A.; Hernandez, J.E.; Lawver, B.S.; Wieting, M.G. Lawrence Livermore National Lab., CA (United States). Aug 1991. In *Engineering research and development thrust area report, FY 90.* 246p. Order Number DE92000519. Source: OSTI; NTIS (US Sales Only).

The authors have developed a computer vision laboratory to use for engineering research and development on a prototype automatic-target-recognition (ATR) system. Their current ATR system correctly identifies objects in simulated images. The overall system, using Gabor transforms and a neural network, has been shown to be robust with respect to variations in orientation, scale, and translation of the objects.

4501 Chemical Explosions and Explosives

7522 (LA–12173-MS) **Vacuum thermal stability of explosives monitored electronically.** Baytos, J.F. Los Alamos National Lab., NM (United States). Nov 1991. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92003735. Source: OSTI; NTIS; GPO Dep.

Two innovations make the vacuum thermal stability (VTS) of explosives amenable to electronic monitoring. The first innovation is that the manometer tube is incorporated as a capacitance transducer into a circuit that generates a voltage proportional to the height of the manometer column. The second innovation is an air back-pressure system by which an air-pressure reduction valve is used to adjust the height of the mercury column so that voltage can be calibrated as a function of the height of the mercury column with the manometer in place. Addition of a power supply/demodulator unit, a data acquisition/control unit, and a dedicated computer complete the monitoring system. A complete description of Los Alamos National Group M-1's modular VTS system is reported, including the heating bath, temperature controller, pressure system, and electronics for data acquisition. Errors of the system are discussed, and typical results for some explosives are given. The calibration, operating, and reporting procedures are given in the Appendices.

7523 (LA–12188-MS) **High explosive material testing laboratory scale model test.** Bolton, B.L.; Browning, R.V.; Berkbigler, L.W. Los Alamos National Lab., NM (United States). Dec 1991. 31p. Sponsored by U.S. DOE Defense Programs. DOE Contract

W-7405-ENG-36. Order Number DE92005351. Source: OSTI; NTIS; GPO Dep.

An experimental study of the personnel protective capability of a proposed high explosive material test laboratory using a one-eighth-scale model is summarized. Various configurations of the scale model were tested against internal blast loading over a range of scaled explosive charged weights. Pressures and resulting impulses were measured at pertinent locations on the model. The experimental results are compared with standard blast loading calculation methods. This study provides data for developing guidelines to protect personnel in typical high explosive test facilities.

7524 **Laser-driven flyer plate.** Paisley, D.L. To Dept. of Energy. 1990. Filed date 2 Apr 1990. USA Patent patent application 7-502,956. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92003832. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of apparatus for producing high velocity flyer plates involving placing a layer of dielectric material between a first metal foil and a second metal foil. With laser irradiation through an optical substrate, the first metal foil forms a plasma in the area of the irradiation, between the substrate and the solid portion of the first metal foil. When the pressure between the substrate and the foil reaches the stress limit of the dielectric, the dielectric will break away and launch the flyer plate out of the second metal foil. The mass of the flyer plate is controlled, as no portion of the flyer plate is transformed into a plasma. 2 figs.

7525 (SAND–91-1882) **Reliability and safety analyses of the Small Projected Line Charge.** Pierce, K.G. Sandia National Labs., Albuquerque, NM (United States). Aug 1991. 31p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004782. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Small Projected Line Charge (SAPLIC) is being developed as a tool for crossing anti-personnel mine fields. This report documents the reliability and safety analyses of the system. The equation relating system reliability to the reliability of the individual components is given, and testing to satisfy the reliability specification is discussed. Fault-tree analyses for premature ignition of the deployment rocket and the line charge were performed. The equations describing the probabilities of premature are given and discussed.

7526 (SAND–91-2486C) **Explosive vapor emission.** Kenna, B.T.; Conrad, F.J.; Hannum, D.W. Sandia National Labs., Albuquerque, NM (United States). [1991]. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9111129–1: FAA explosives detection symposium, Atlantic City, NJ (United States), 13-15 Nov 1991). Order Number DE92002932. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Emission rates of explosive vapors from explosive samples dictate whether various techniques can be used to provide a constant vapor source for instrument evaluation. Indeed, emission rates determine whether a particular detection system is applicable directly for explosive vapor detection or if an initial "helping" step, such as preconcentration, is required. This work is a theoretical study of emission rate for TNT and RDX. Two vapor source techniques are evaluated, viz. a wire mesh screen coated with explosive material in a "hair dryer" air flow and a packed column of various lengths which has air flow through it. 3 refs., 5 figs.

4502 Nuclear Explosions and Explosives

Refer also to citation(s) 6761, 7448

7527 (ANL/CP–73505) **APSTNG: Radiation interrogation for verification of chemical and nuclear weapons.** Rhodes, E. (Argonne National Lab., IL (United States)); Dickerman, C.E.; DeVolpi, A.; Peters, C.W. Argonne National Lab., IL (United States). [1991]. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-31109-ENG-38. (CONF-911106–35: IEEE nuclear science symposium, Santa Fe, NM (United States), 5-9 Nov 1991). Order Number DE92003998. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A recently developed neutron diagnostic probe system has the potential to satisfy a significant number of van-mobile and fixed-portal requirements for nondestructive verification of sealed munitions. The probe is based on a unique associated-particle sealed-tube neutron generator (APSTNG) that interrogates a TLI with a low-intensity beam of 14-MeV neutrons generated from the deuterium-tritium reaction and that detects the alpha-particle associated with each neutron. Gamma-ray spectra of resulting neutron inelastic scattering and fission reactions identify nuclides associated with all major chemicals in chemical warfare agents, explosives, and drugs, as well as many pollutants and fissile and fertile special nuclear material. Flight times determined from detection times of the gamma-rays and alpha-particles yield a separate tomographic image of each nuclide. The APSTNG also forms the basis for a compact fast-neutron transmission imaging system that can be used along with or instead of the emission imaging system. The small and relatively inexpensive APSTNG exhibits high reliability and can be quickly replaced. Proof-of-concept experiments have been performed under laboratory conditions for simulated nuclear, high-explosive, and chemical warfare munitions.

7528 (CONF-8909163–16) **The Delamar fracture zone: Recognition of unmapped zones of weakness on Pahute Mesa, Nevada Test Site.** Covington, H.R. Geological Survey, Mercury, NV (United States). [1989]. 12p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AI08-86NV10583. From 5. symposium on containment of underground nuclear explosions; Santa Barbara, CA (United States); 19-21 Sep 1989. Order Number DE92004280. Source: OSTI; NTIS; GPO Dep.

The Delamar underground nuclear test, conducted at Pahute Mesa, Nevada Test Site, formed extensive fracture zones. The orientation, extent (more than 500 m north and south of surface ground zero), and linear distribution of the fractures suggest the presence of two preexisting zones of weakness. Because these zones had not been identified prior to the test, studies were initiated to determine that nature of these zones and to define methods to identify similar zones in the future. The methods selected to characterize the fracture zones were mapping surface effects on low-altitude aerial photographs, (2) trenching, (3) exploratory drilling, and (4) surface magnetic surveys. Preliminary results of these investigations show that the two fracture zones occurred along preexisting zones of weakness. The studies also determined that previously unrecognized zones of weakness may be identified using surface mapping techniques. The primary surface features that can be used in the recognition of such zones are (1) a linear feature or an albedo change across a linear future, on aerial photographs, (2) a linear break between areas of very little and abundant caliche clasts in the surface soil, (3) a linear disruption of rock varnish, and (4) a liner distribution of chalcedony clasts in the surface soil. The recognition of these zones of weakness during pre-drill field investigation at future sites will allow an early assessment of the possible impact of these structures on containment, and provide data for possible relocation of the site.

7529 (LA-UR–91-3749) **Timing system for firing widely spaced test nuclear detonations.** Partridge, R.E. Los Alamos National Lab., NM (United States). [1991]. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-911269–1: Precision time and time interval (PTTI) meeting, Pasadena, CA (United States), 3-5 Dec 1991). Order Number DE92003793. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The national nuclear weapons design laboratories (Los Alamos National Laboratory and Lawrence Livermore National Laboratory) test fire nuclear devices at the Nevada Test Site (NTS), which is spread over an area of over 1200 square miles (a bit larger than the state of Rhode Island). On each test there are hundreds of high time resolution recordings made of nuclear output waveforms and other phenomena. In order to synchronize these recordings with each other, with the nuclear device, and with offsite recordings, there is a requirement that the permanent command center and the outlying temporary firing sites be time tied to each other and to UTC to permit firing the shot at a predetermined time with an accuracy of about a microsecond. The system is so designed that this can be reduced to about 100 nanoseconds if it should prove necessary in the future. New firing sites are created about every month. A year or so lead time is needed to drill and prepare each ground zero emplacement hole and its associated trailer park in the forward area. A few weeks before the nuclear device is brought in, the recording stations and trailers are emplaced in the trailer park and interconnected, and dry runs begin. By this time the trailer park timing stating has been linked to the control room at the command center control point by fiber optics or microwaves. The timing station and the control room are synchronized by travelling clocks, by the communication links, and by GPS receivers. The control room can be linked simultaneously with up to four forward area sites in various stages of preparation.

7530 (RFP–4349) **Substituting water for chlorofluorocarbon liquid in density measuring baths for nuclear weapon components on non-fissile alloys.** Beitscher, S.; Palachek, A.D. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 23 Sep 1991. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC34-90DP62349. Order Number DE92005227. Source: OSTI; NTIS; GPO Dep.

This project was part of a Rocky Flats Plant and Department of Energy weapons complex effort to reduce release of hazardous materials to the atmosphere. Experiments were performed to determine whether deionized water could be substituted for trichlorotrifluoroethane (CFC 113) in the bath of a density measuring system. In the first experiment, 14 parts of seven types were tested: They included shells of beryllium, vanadium, titanium, stainless steel, uranium, a uranium alloy, and casting feed strips of a uranium alloy. Each part was measured for density five times in each medium. The entire experiment was repeated – the only change being addition of a wetting agent to the water. Two additional experiments were confided to the uranium alloy casting feed strips. As a result of this study, it is recommended that CFC be discontinued as a bath medium for the part types studied in this investigation and that deionized water be substituted.

7531 (SAND–90-2711) **Fiberline stronglink: Design and implementation.** Kuehn, S.F.; Sweatt, W.C. Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 31p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004115. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The CAE, Switching, and Optic Devices Division (2542), with the assistance of the Photometrics and Optical Development Division (2756), is providing an optical stronglink design for the Direct Optical Initiation program. In this report, the design criteria and test results are described for the use of a corner cube (retroreflector) and the MC3831 D-module stronglink mechanism.

7532 (SAND–90-8248) **Survey of metal finishing capabilities in the Nuclear Weapons Complex.** Johnson, H.R.; Stoltz, R.E. Sandia Labs., Livermore, CA (United States). Dec 1990. 60p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DR00789. Order Number DE92004679. Source: OSTI; NTIS; GPO Dep.

This report presents the results of a survey of the metal finishing capabilities of the following design and production agencies in the Nuclear Weapon Complex: Allied Signal Aerospace Co. (AS), General Electric Neutron Device Division (GEND), Los Alamos National Laboratory (LANL), Lawrence Livermore National Laboratory (LLNL), EG&G Mound Applied Technology (MD), EG&G Rocky Flats Plant (RF), Sandia National Laboratories, Albuquerque (SNL, A), Sandia National Laboratories, Livermore (SNL, L) and Martin Marietta Energy Systems, Inc. (Y-12). It defines the current status of electroplating and its allied processes at each of these agencies, the methods and procedures for handling waste, and the major environmental, safety, and health issues confronting metal finishing personnel.

7533 (SAND–91-2328) **Development report on the DT1115 development tester for the MC4073 SRAM II Programmer.** Brewer, T.H.; Clark, J.D.; Fajardo, P.L.; Furry, C.M.; Jensen, D.L.; Marcon, J. Jr. Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 26p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE92004853. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Supersedes Development Report dated May 21, 1990.

This report describes the DT1115 test system that was designed by Sandia's Digital Subsystems and Test Equipment Division 2313 to support the development of the MC4073 SRAM 2 Programmer. The MC4073 was designed by Sandia's Digital Subsystems 3 Division 2314 and is produced by Allied Signal Kansas City Division (KCD). The DT1115 is used at KCD to test Group 2 and Group 2A MC4073s per the requirements of AC411399-300 INSPECTION REQUIREMENTS, MC4073. The SE3158 test system, designed by Division 2314, is used at Sandia to test the MC4073.

4503 Nuclear Explosion Detection

7534 (UCRL-ID–108241) **The LLNL configurable seismic monitoring system: Final report.** Nakanishi, K.K.; Zucca, J.J.; Bowman, B.C.; Ewert, D.W.; Harben, P.E.; Jarpe, S.P.; Johnston, C.A.; Rock, D.W. Lawrence Livermore National Lab., CA (United States). 23 Sep 1991. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE92004634. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) developed and tested a portable, high-quality seismic recording system for monitoring underground nuclear explosions. The configurable seismic monitoring system (CSMS) was designed to satisfy the designated seismic station (DSS) requirements for instrumentation to be deployed in a vault as set forth in the protocol of the Threshold Test Ban Treaty (TTBT). As a proof-of-concept test under treaty monitoring conditions, two configurations of this system were built, and each was deployed at a different seismic station to record the Nevada Test Site (NTS) event Bexar. Both configurations successfully recorded this event, demonstrating the flexibility and the operation of the basis design. 3 refs., 8 figs.

4505 Strategic Defense Initiative

7535 (DOE/SF/17124–T1) **A superior optical baffle material: Final report.** Spire Corp., Bedford, MA (United States). Nov 1988. 53p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC03-87SF17124. (FR–10107). Order Number DE92004335. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The work reported on in this document addresses problems affecting the presently available optical baffle materials for space-based telescopes or strategic optical systems. During the course of this one year effort substantial progress has been achieved in the creation of a new form of durable radiation-hardened metallic light-absorbing baffle material. It is believed that there is great potential for solving many of the problems encountered in the design and fabrication of protective baffles through extension of the ideas and procedures developed in this program. The new baffle material developed also has potential for being used as a laser hard, high emissivity surface for heat radiatus in space.

7536 (LA–11810-MS) **National security uses of space: Status, prospects, and issues.** Browne, J.C.; Garrity, P.J.; Canavan, G.H. Los Alamos National Lab., NM (United States). Jan 1992. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92005354. Source: OSTI; NTIS (US Sales Only); GPO Dep.

National security uses of space have grown rapidly in the last two decades because only space platforms can perform certain vital missions. Currently, space-based systems are used for information communication, and early warning. The pressure for more, and more capable, space systems should grow as fast over the next two decades as it has in the last two in support of strategic deterrence, conventional military operations, and strategic defenses.

7537 (LA–11855-MS) **Suppression of space-based interceptors by neutral particle beams.** Canavan, G.H. Los Alamos National Lab., NM (United States). Nov 1991. 15p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-7405-ENG-36. Order Number DE92004339. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Neutral particle beams (NPBs) popped up before missile launch could irradiate space-based interceptors (SBIs), suppressing those that could effectively attack the missiles. NPB effectiveness could be quite high against unshielded, undecoyed SBIs. The results sensitive to launch radius, beam brightness, and SBI hardness. Even low-brightness NPBs would be effective in suppressing the threats over compact launch areas. 20 refs.

7538 (LA–11880-MS) **Approximate average deployments versus defense parameters.** Canavan, G.H. Los Alamos National Lab., NM (United States). Dec 1991. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92004751. Source: OSTI; NTIS; GPO Dep.

Calculations of the number of reentry vehicles (RVs) killed as a function of missile and defense parameters can be well approximated by analytic expressions that are valid for all numbers of missiles and interceptors. The approximation uniformly underestimates the effectiveness of boost-phase defenses: the discrepancies in kill rates are about 10%. If if is used to size the boost phase of two-layer defenses, the uncertainties would at worst double the demands on the midcourse layer, which is generally a minor part of the total. 4 refs., 3 figs.

7539 (LA–12064-MS) **Role of terminal defenses in strategic defense.** Canavan, G.H. Los Alamos National Lab., NM (United States). Dec 1991. 14p. Sponsored by U.S. DOE Office of Administration and Human Resource Management; U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE92004340. Source: OSTI; NTIS; GPO Dep.

Terminal interceptors can use the atmosphere for discrimination. They also have disadvantages in development, cost, saturation, and susceptibility to preferential attacks. Terminal could be preferred for higher midcourse costs or decoys. Their main limitation is battlespace. It is possible to integrate boost- and terminal-phase defenses by reducing the number of reentry vehicles penetrating the boost phase to the roughly one per target terminal defenses could handle. Terminal defenses could offset boost-phase defenses' lack of preferentiality and midcourse defenses; sensitivity to decoys. 15 refs.

7540 (CONF-9111126–2) **From nuclides to nerve gas: The development of the Chemical Stockpile Emergency Preparedness Exercise Program.** Gant, K.S.; Adler, M.V. Oak Ridge National Lab., TN (United States). [1991]. 13p. Sponsored by U.S. Federal Emergency Management Agency. DOE Contract AC05-84OR21400. From 15. annual TRADE (training resources and data exchange) conference; St. Petersburg, FL (United States); 18-20 Nov 1991. Order Number DE92003511. Source: OSTI; NTIS; INIS; GPO Dep.

The Army and the Federal Emergency Management Agency established the Chemical Stockpile Emergency Preparedness Program (CSEPP), to improve emergency preparedness around each location storing the nation's aging stockpile of unitary chemical weapons. The CSEPP requires that a series of exercises be conducted at each location on a regular schedule. The CSEPP exercise program drew upon the existing Army and civilian exercises. Merging the exercise traditions of both the communities and installations into a joint exercise program acceptable to both sides and the particular nature of the hazard required a number of adjustments in the usual approaches. 14 refs., 1 fig.

7541 (UCRL-JC–108358) **Environmental database at a superfund site.** Cederwall, P.L. Lawrence Livermore National Lab., CA (United States). Nov 1991. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-920145–2: Making information work, Washington, DC (United States), 21-23 Jan 1992). Order Number DE92003978. Source: OSTI; NTIS; GPO Dep.

The information model and data analysis and display system for the integrated environmental database, Monitor, developed and used by the Environmental Restoration Division of Lawrence Livermore National Laboratory is discussed in this paper. Types of data stored in the database are enumerated and strategies for their retrieval suggested. The location-based relational information model is explained; location nomenclature is illustrated; treatment of censored analytical data is discussed; the flow of data into the database is outlined. A database/data-analysis integration tool under development is described. 1 fig.

7542 (ANL/CP–71762) **Potential changes in atmospheric chemistry in the decades ahead: Climate and biosphere interactions and feedbacks.** Gaffney, J.S.; Marley, N.A. Argonne National Lab., IL (United States). Oct 1991. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-9107104–18: 5. international conference on precipitation scavenging and atmosphere surface exchange process, Richland, WA (United States), 15-19 Jul 1991). Order Number DE92003403. Source: OSTI; NTIS; GPO Dep.

Atmospheric chemistry is a challenging area of research where much knowledge is needed if we are to continue to survive as a species. This paper outlines research needs in the decades ahead in this key area of scientific endeavor. Highlighted are areas of research that are likely to lead to climatic and biospheric impacts and have been given little attention in the past. In particular, the possible organic transformation chemistries that may lead to chemical and physical changes in tropospheric cloud chemistries are highlighted and emphasized as an area where research is needed in the future. 22 refs.

7543 (BNL–46337) **X-ray microprobe studies of Hungarian background and urban aerosols.** Toeroek, S. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Sandor, S.; Xhoffer, C.; Van Grieken, R.; Jones, K.W.; Sutton, S.R.; Rivers, M.L. Brookhaven National Lab., Upton, NY (United States). Oct 1991. 6p. Sponsored by U.S. DOE Energy Research; Hungarian Academy of Sciences; Government of Belgium. DOE Contract AC02-76CH00016. (CONF-910862–7: Pacific-international congress on x-ray analytical methods, Honolulu, HI (United States), 12-16 Aug 1991). Order Number DE92005001. Source: OSTI; NTIS; GPO Dep.

In order to determine the polluting atmospheric sources in urban and background areas source apportionment of the air particulate matter is necessary. Hitherto these studies were mostly based on bulk composition measurements of the aerosol. Source profiles, i.e. the concentrations of several elements for air particulate matter originating from one source, can be deduced from the receptor data using a number of multivariate techniques among which the chemical mass balance. The application is limited by the large number of observations that must be made for each of the variables. Often an elaborated sample preparation is necessary for fractionating the sample into several sub samples, according to the density, particle diameter or other relevant properties. Often this may results in poorly resolved source profiles. The aim of the present work is to find the relative abundance of the particle types originating from two different background monitoring stations in the middle of the Great Hungarian Plain. In urban areas most pollutants originate from traffic and municipal waste incineration. Since heavy metals play an important role in these samples the highly sensitive x-ray microscope (XRM) of the National Synchrotron Light Source (NSLS) of the Brookhaven National Laboratory was used. A feasibility study on individual aerosol particles sampled at the above background stations and in the urban area of Budapest is discussed.

7544 (DOE/ER–0512T) **Atmospheric Sciences Program: Summaries of research in FY 1991.** USDOE Office of Energy Research, Washington, DC (United States). Office of Health and Environmental Research. Nov 1991. 39p. Sponsored by U.S. DOE

Energy Research. Order Number DE92004111. Source: OSTI; NTIS; GPO Dep.

This document describes the activities and products of the Atmospheric Sciences Program of the Environmental Research, Office of Energy Research, US Department of Energy, in Fiscal Year (FY) 1991. The report is organized into four main sections. Research projects in atmospheric chemistry, atmospheric dynamics and support operations are described. Principal investigators, their institutions, goals, level of effort, and products expected are listed.

7545 (DOE/ER/13772–4) **Kinetics and dynamics of oxidation reactions involving an adsorbed CO species on bulk and supported platinum and copper-oxide: First year annual report, January 1, 1991–December 31, 1991.** Harold, M.P. Massachusetts Univ., Amherst, MA (United States). Dept. of Chemical Engineering. Jul 1991. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13772. Order Number DE92005077. Source: OSTI; NTIS; GPO Dep.

The proposed research is an integrated experimental and modeling study of oxidation reactions involving CO as a key player – be it a reactant, adsorbed intermediate, and/or partial oxidation product – in the catalytic sequence and chemistry. The reaction systems of interest in the project include CO, formaldehyde, and methanol oxidation by O_2 and CO oxidation by NO, on both Pt and copper oxide catalysts. These reactions are of importance in automobile exhaust catalysis. There is a paucity of rate data in the literature for these important environmental control reactions. The goal of this research is to better understand the catalytic chemistry and kinetics of oxidations reactions involving CO as an adsorbed intermediate. Successfully meeting this goal requires an integration of basic kinetic measurements, in situ catalyst surface monitoring, kinetic modeling, and nonlinear mathematical tools.

7546 (DOE/NV/10630–20-Vol.2) **US Department of Energy, Nevada Operations Office: Annual site environmental report, 1990: Volume 2, Appendices.** McDowell, E.M.; Black, S.C. (eds.). Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). Sep 1991. 253p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-89NV10630. Order Number DE92000107. Source: OSTI; NTIS; INIS; GPO Dep.

These appendices contain 1990 Nevada Test Site (NTS) onsite and offsite milk environmental monitoring results. The onsite data presented are accompanied by summaries of statistical evaluations of the data. Other offsite data collected by the EPA are available from the US Environmental Protection Agency, Environmental Monitoring Systems Laboratory, Las Vegas, Nevada. The findings of these monitoring and surveillance efforts are described in volume one of this document. 59 figs., 37 tabs.

7547 (EML–542) **Environmental Measurements Laboratory annual report, 1990.** Chieco, N.A.; Hoppen, J. (eds.). USDOE Environmental Measurements Lab., New York, NY (United States). Nov 1991. 111p. Sponsored by U.S. DOE Energy Research. Order Number DE92004856. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the activities of the Environmental Measurements Laboratory (EML) for the calendar year 1990 and it serves as an annual report to the Director of the Office of Energy Research (OER), the Associate Director and staff of the Office of Health and Environmental Research (OHER), the manager and staff of the Field Office–Chicago, and our colleagues. Emphasized are the progress and accomplishments of the year, rather than future plans or expectations. The technical summaries are grouped according to the following six general program areas: environmental radiation and radioactivity; radiation transport and dosimetry; environmental radon, thoron, and related aerosols; atmospheric and surface pollutant studies related to global climate change; ecological and subsurface pollutant research; and metrology, consultation, and emergency response.

7548 (EML–543) **Semi-annual report of the Department of Energy Quality Assessment Program.** Sanderson, C.G.; Scarpitta, S.C. USDOE Environmental Measurements Lab., New York, NY (United States). 2 Jan 1992. 119p. Sponsored by U.S. DOE Energy Research. Order Number DE92004855. Source: OSTI; NTIS; GPO Dep.

This report presents the results from the analysis of the 35th set of environmental quality assessment samples (QAP XXXV) that were received on or before December 5, 1991. This Quality Assessment Program (QAP) is designed to test the quality of the environmental measurements being reported to the Department of Energy by its contractors. Since 1976, real or synthetic environmental samples that have been prepared and thoroughly analyzed at the Environmental Measurements Laboratory (EML) have been distributed at first quarterly and then semi-annually to these contractors. Their results, which are returned to EML within 90 days, are compiled with EML's results and are reported back to the participating contractors 30 days later. A summary of the reported results is available to the participants 3 days after the reporting deadline via a modem-telephone connection to the EML computer.

7549 (ENEA-RT-NUCL–90-22) **POLLSIM pollutant material accountancy code.** Dionisi, M.; Remetti, R. ENEA, Casaccia (Italy). Area Nucleare. Sep 1991. 18p. (In Italian). (RT/NUCL–90-22). Order Number DE92743982. Source: OSTI; NTIS (US Sales Only).

A SIMSCRIPT simulation code named POLLSIM was realized in order to test the performance of a pollutant material (e.g., sulfur, cadmium, chromium, fly ash) accountancy system within a material balance area with a one point-like emission source. The reference plant was a 660 MW(e) coal fired power plant with a fuel feeding rate of 200 tonnes/hour of less than 1% sulfur - 15% ash content coal. The main feature of this code is that it integrates continuous simulation with a list of impulsive events such as malfunctions of safeguard systems and/or intentional violations of stack emission rules.

7550 (INIS-mf–12961, pp. 97) **A study on radon concentrations in buildings of the Vienna region in Austria in the winter and summer and an estimation of the resulting effective dose equivalent.** Steger, F. (Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria)); Hefner, A. Atomic Energy Organization of Iran, Teheran (Iran, Islamic Republic of). Radiation Protection Dept. 1990. 157p. (CONF-9011232–: International conference on high levels of natural radiation, Ramsar (Iran, Islamic Republic of), 3-7 Nov 1990). In *Book of abstracts international conference on high levels of natural radiation Ramsar, Islamic Republic of Iran, 3-7 Nov 1990.* Order Number DE92601158. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. NATURAL RADIOACTIVITY/austria; RADON 222/dose equivalents; BUILDINGS; DAUGHTER PRODUCTS; HUMAN POPULATIONS; INHALATION; AUSTRIA

7551 (ISAS–641) **Electron temperature in the E-region of the ionosphere.** Zalpuri, K.S.; Oyama, K.-I. Institute of Space and Astronautical Science, Sagamihara, Kanagawa (Japan). Jun 1991. 19p. Order Number DE92750870. Source: OSTI; NTIS (US Sales Only); INIS.

Various heating and cooling mechanisms which are operative in the lower E-region are discussed and their relative importance in different altitude range is shown. These heating and cooling rates are then used to derive the electron temperature T_e. The calculated values of electron temperature are found to be higher than neutral temperature through out the altitude range 100 ≈ 150 km, with the difference increasing with increase in altitude. However, compared to observed values of T_e, the calculated values are still smaller below about 130 km. Above this altitude, the calculated values become larger. Estimation of T_e for different, suggested values of heating efficiency due to dissociative recombination, show that T_e profile obtained even be assuming a constant value of 1.3 eV is in fairly good agreement with those derived based on variable values of this parameter. (author).

7552 (Juel–2388) **Investigations on atmospheric dispersion of air pollutants after short-time releases in complex terrain. Third field experiment on atmospheric dispersion around the isolated hill Sophienhoehe in August/September 1988. Methods - experiments - data bank.** Zeuner, G.; Heinemann, K. (eds.); Bahmann, W.; Becker, K.; Frank, J.; Gryning, S.E.; Lyck, E.; Mextorf, O.; Moellmann-Coers, M.; Moenig, C.; Narres, H.D.; Oetz, C.; Oetz, W.; Polster, G.; Veroustraete, F.; Voss, W. Forschungszentrum Juelich GmbH (Germany). Abt. Sicherheit und Strahlenschutz. Sep 1990. 273p. Order Number DE92759209. Source: OSTI; NTIS (US Sales Only).

In order to set up a data bank for the validation of advanced dispersion models, comprehensive meteorological measurements and dispersion experiments in a complex terrain with a well measured topography are being carried out. These investigations have become possible in cooperation with several external groups and with the financial support of the 'Bundesminister fuer Umwelt, Naturschutz und Reaktorsicherheit'. In this report the methods, experiments and results (data bank) of the third field experiment are described. (orig.).

7553 (Juel–2474) **Studies on dust separation in wet scrubbers by water vapour condensation.** Grund, T. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemische Technologie; Technische Hochschule Aachen (Germany). May 1991. 126p. (In German). Order Number DE92750127. Source: OSTI; NTIS (US Sales Only).

The off-gas from the incineration of waste and fossil fuels contains numerous gaseous and solid pollutants which must be removed as far as possible from this off-gas by off-gas cleaning. This investigation involved experiments in which very fine dust particles (aerosols) in the particle size range from 0.05 to 6 μm were separated from the gas in a spray washer. The objective was to examine the extent to which dust separation can be improved or simplified by combining it with the condensation of the water vapour present in the exhaust gas. A laboratory facility was constructed for these investgations providing the possibility of comparing various process technologies during condensation in front of and in a wet scrubber while varying the gas parameters of dust content, particle size distribution and water vapour content. The results of the measurements show that not the water content or the condensed water quantity alone is of significance for improving the dust separation by condensation of water vapour. On the contrary, the essential prerequisite is a proper procedure for initiating condensation and the creation of thermodynamic conditions under which a condensation on the aerosols is possible. If these conditions, realizable with existing scrubbers, are achieved then condensation leads to improved dust separation over the entire particle size range. In the experiments improvements of up to 95% or more of the total degree of separation were achieved by condensation in comparison to separtion without condensation. (orig.).

7554 (KFK–4842) **KfK, Institute of Meteorology and Climate Research. Status report on research and development activities in 1990.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Meteorologie und Klimaforschung. Mar 1991. 15p. (In German). Order Number DE92759329. Source: OSTI; NTIS (US Sales Only).

The Institute's activities in 1990 included experimental work on the terrestrial surface climate, as well as numerical simulation models for describing and forecasting atmospheric exchange processes in the mesoscale region and a satellite-borne data processing system for remote monitoring of atmospheric parameters. The work on the development of radiation transfer models is described. A list of the Institute's publications in 1990 is enclosed. (KW).

7555 (LA-UR–91-3950) **Global simulations of smoke from Kuwaiti oil fires and possible effects on climate.** Glatzmaier, G.A.; Malone, R.C.; Kao, C.Y.J. Los Alamos National Lab., NM (United States). [1991]. 7p. Sponsored by U.S. DOE Office of Administration and Human Resource Management. DOE Contract W-7405-ENG-36. (CONF-9110127–1: Conference on global climate change: its mitigation through improved production and utilization of energy, Los Alamos, NM (United States), 21-24 Oct 1991). Order Number DE92005068. Source: OSTI; NTIS; GPO Dep.

The Los Alamos Global Climate Model has bee used to simulate the global evolution of the Kuwaiti oil fire smoke and its potential effects on the climate. The initial simulations were done shortly before the fires were lit in January 1991. They indicated that such an event would not result in a "Mini Nuclear Winter" as some people were suggesting. Further simulations during the year suggested that the smoke could be responsible for subtle regional climate changes in the spring such as a 5 degree centigrade decrease in the surface temperature in Kuwait, a 10% decrease in precipitation in Saudi Arabia and a 10% increase in precipitation in the Tibetan Plateau region. These results are in qualitative agreement with the observations this year.

7556 (ORNL/CDIAC–37) **An updated global grid point surface air temperature anomaly data set: 1851–1990.** Sepanski, R.J.; Boden, T.A.; Daniels, R.C. Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center. Oct 1991. 5225p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (NDP–020/R1). Order Number DE92004582. Source: OSTI; NTIS; GPO Dep.

Includes 20 sheets of 24 microfiche supplements. Environmental Sciences Division Publication No. 3520.

This document presents land-based monthly surface air temperature anomalies (departures from a 1951–1970 reference period mean) on a 5° latitude by 10° longitude global grid. Monthly surface air temperature anomalies (departures from a 1957–1975 reference period mean) for the Antarctic (grid points from 65°S to 85°S) are presented in a similar way as a separate data set. The data were derived primarily from the World Weather Records and the archives of the United Kingdom Meteorological Office. This long-term record of temperature anomalies may be used in studies addressing possible greenhouse-gas-induced climate changes. To date, the data have been employed in generating regional, hemispheric, and global time series for determining whether recent (i.e., post-1900) warming trends have taken place. This document also presents the monthly mean temperature records for the individual stations that were used to generate the set of gridded anomalies. The periods of record vary by station. Northern Hemisphere station data have been corrected for inhomogeneities, while Southern Hemisphere data are presented in uncorrected form. 14 refs., 11 figs., 10 tabs.

7557 (PNL–6450-47-HEDR) **Hanford Environmental Dose Reconstruction Project: Monthly report.** Pacific Northwest Lab., Richland, WA (United States). Sep 1991. 73p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE92003961. Source: OSTI; NTIS; GPO Dep.

The objective of the Hanford Environmental Dose Reconstruction Project is to estimate the radiation dose that individuals and populations could have received from nuclear operations at Hanford since 1944. The project is divided into five technical tasks. These tasks correspond to the path radionuclides followed, from release to impact on humans (i.e., dose estimates). The Source Terms Task develops estimates of radioactive emissions from Hanford facilities since 1944. The Environmental Transport Task reconstructs the movements of radioactive particles from the areas of release to populations. The Environmental Monitoring Data Task assemblies, evaluates and reports historical environmental monitoring data. The Demographics, Agriculture and Food Habits Task develops the data needed to identify the populations that could have been affected by the releases. The Environmental Pathways and Dose Estimates Task used the information derived from the other Tasks to estimate the radiation doses individuals could have received from Hanford radiation. This document lists the progress on this project as of September 1991. 3 figs., 2 tabs.

7558 (PNL–7781) **Generator, mechanical, smoke: For dual-purpose unit, XM56, Yuma Proving Ground, Yuma, Arizona: Environmental assessment.** Driver, C.J. (Pacific Northwest Lab., Richland, WA (United States)); Ligotke, M.W.; Moore, E.B. Jr.; Bowers, J.F. Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 40p. Sponsored by U.S. Department of Defense. DOE Contract AC06-76RL01830. Order Number DE92001826. Source: OSTI; NTIS; GPO Dep.

The US Army Chemical Research, Development and Engineering Center (CRDEC) is planning to perform a field test of the XM56 smoke generator at the US Army Yuma Proving Ground (YPG), Arizona. The XM56, enabling the use of fog oil in combination with other materials, such as graphite flakes, is part of an effort to improve the efficiency of smoke generation and to extend the effectiveness of the resulting obscurant cloud to include the infrared spectrum. The plan field operation includes a road test and concurrent smoke- generation trials. Three M1037 vehicles with operation XM56 generators will be road-tested for 100 h. Smoke will be generated for 30 min from a single stationary XM56 four times during the road test, resulting in a total of 120 min of smoke generation.

The total aerial release of obscurant materials during this test is expected to be 556 kg (1,220 lb) of fog oil and 547 kg (1,200 lb) of graphite flakes. This environmental assessment has evaluated the consequences of the proposed action. Air concentrations and surface deposition levels were estimated using an atmospheric dispersion model. Degradation of fog oil and incorporation of graphite in the soil column will limit the residual impacts of the planned action. No significant impacts to air, water, and soil quality are anticipated. risks to the environment posed by the proposed action were determined to be minimal or below levels previously found to pose measurable impacts. Cultural resources are present on YPG and have been identified in adjacent areas; therefore, off-road activities should be preceded by a cultural resource survey. A Finding of No Significant Impact is recommended. 61 refs., 1 fig.

7559 (PNL–7868-HEDR) **Letter report: References for radioactive releases to the atmosphere from Hanford operations, 1944–1957: Hanford Environmental Dose Reconstruction Project.** Hall, R.B. Pacific Northwest Lab., Richland, WA (United States). Nov 1991. 19p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE92004640. Source: OSTI; NTIS; GPO Dep.

A search was made for published documents related to discharges of radioactive material from Hanford Site facilities to the atmosphere from 1944–1957. The purpose was to list documents that contain data that might be useful in developing a source term for airborne releases. The source term for the radionuclide that contributes most to dose, ioidine-131, is a separate effort. Other source terms will be developed later. This tabulation of published summaries of atmospheric release data shows the type of measurements that were being made from 1944–1957 and the magnitude of the discharges to the atmosphere. In the early years, very little data were collected that related to specific radionuclides. However, most of the key radionuclides were known to be present in effluents from occasional specific radionuclide analyses. 2 refs.

7560 (PNL–7964) **Environmental surveillance master sampling schedule.** Bisping, L.E. Pacific Northwest Lab., Richland, WA (United States). Jan 1992. 57p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC06-76RL01830. Order Number DE92005356. Source: OSTI; NTIS; GPO Dep.

Environmental surveillance of the Hanford Site and surrounding areas is conducted by the Pacific Northwest Laboratory (PNL) for the US Department of Energy (DOE). This document contains the planned schedule for routine sample collection for the Surface Environmental Surveillance Project (SESP) and Ground-Water Monitoring Project. Samples for radiological analyses include Air-Particulate Filter, gases and vapor; Water/Columbia River, Onsite Pond, Spring, Irrigation, and Drinking; Foodstuffs/Animal Products including Whole Milk, Poultry and Eggs, and Beef; Foodstuffs/Produce including Leafy Vegetables, Vegetables, and Fruit; Foodstuffs/Farm Products including Wine, Wheat and Alfalfa; Wildlife; Soil; Vegetation; and Sediment. Direct Radiation Measurements include Terrestrial Locations, Columbia River Shoreline Locations, and Onsite Roadway, Railway and Aerial, Radiation Surveys.

7561 (UCRL-JC–106109-Rev.1) **A numerical model of aerosol scavenging: Part 1, Microphysics parameterization.** Molenkamp, C.R.; Bradley, M.M. Lawrence Livermore National Lab., CA (United States). Sep 1991. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9107104–19-Rev.1: 5. international conference on precipitation scavenging and atmosphere surface exchange process, Richland, WA (United States), 15-19 Jul 1991). Order Number DE92004665. Source: OSTI; NTIS; GPO Dep.

We have developed a three-dimensional numerical model (OCTET) to simulate the dynamics and microphysics of clouds and the transport, diffusion and precipitation scavenging of aerosol particles. In this paper we describe the cloud microphysics and scavenging parameterizations. The representation of cloud microphysics is a bulk- water parameterization which includes water vapor and five types of hydrometeors (cloud droplets, rain drops, ice crystals, snow, and graupel). A parallel parameterization represents the scavenging interactions between pollutant particles and hydrometeors including collection of particles because of condensation nucleation, Brownian and phoretic attachment, and inertial capture, resuspension because of evaporation and sublimation; and transfer interactions where particles collected by one type of hydrometeor are transferred to another type of freezing, melting, accretion, riming and autoconversion.

7562 (UCRL-JC–106966-Rev.1) **Drop size distributions and the efficiency of nucleation scavenging over the Hardiman fire: Revision 1.** Chuang, C.C.; Penner, J.E.; Edwards, L.L. Lawrence Livermore National Lab., CA (United States). Oct 1991. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-9107104–2-Rev.1: 5. international conference on precipitation scavenging and atmosphere surface exchange process, Richland, WA (United States), 15-19 Jul 1991). Order Number DE92004663. Source: OSTI; NTIS; GPO Dep.

A prescribed burn experiment was conducted in Hardiman Township, Ontario, Canada in August 1987. The fire was of adequate intensity to force the formation of a cumulus cloud, and much of the smoke passed through this cloud. The evolution of the smoke and drop size distributions within this fire-driven cloud due to nucleation and condensation was calculated by a detailed microphysical entraining model. We investigate the sensitivity of nucleation scavenging and drop number concentration to the different environmental aerosol distributions. The predicted drop size distribution and the measured data above the fire are in good agreement for drop sizes which correspond to condensation on the measured smoke spectra. The results from this study can be used to develop a parameterization that relates the drop number to the updraft velocity and the aerosol number at cloud base. We plan to extend this study to predict the effects of aerosols on drop spectra for use in climate models.

7563 (UCRL-JC–108038-Rev.1) **Impact of reactive nitrogen emissions from fossil fuel combustion and biomass burning on atmospheric chemistry: Revision 1.** Dignon, J.; Penner, J.E.; Atherton, C.S.; Walton, J.J. Lawrence Livermore National Lab., CA (United States). Sep 1991. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-910809–2-Rev.1: International symposium on energy and environment, Espoo (Finland), 25-28 Aug 1991). Order Number DE92003544. Source: OSTI; NTIS; GPO Dep.

In this study, using a Lagrangian chemical-transport-deposition model adapted to the nitrogen cycle, we will look at all of the known sources of nitrogen oxides, both natural and man-made. We will attempt to quantify the relative affect that man made sources including fossil fuel and biomass burning have had on the nitrogen cycle and the chemistry of the atmosphere throughout the globe. (JL)

7564 (UCRL-JC–108318) **Greenhouse gases: Sources and emissions.** Edmonds, J. (Pacific Northwest Lab., Richland, WA (United States)); Wuebbles, D.J. Lawrence Livermore National Lab., CA (United States). 30 Mar 1991. 30p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-7405-ENG-48 ;AC06-76RL01830. (CONF-910405–2: World Coal Institute conference and exhibition on coal in the environment, London (United Kingdom), 3-5 Apr 1991). Order Number DE92004672. Source: OSTI; NTIS; GPO Dep.

The current interest in the "greenhouse" issue stems from the observation that the concentrations of such gases as CO_2, CH_4, N_2O, $CFCl_3$ and CF_2Cl_2 have been increasing. Changes in the concentrations of these gases hold the potential for changing the Earth's climate. In the discussion that follows, we will examine recent and long-term trends in the atmosphere, and the current understanding of the sources of the most important radiatively important gases released as byproducts of human activities. These gases are: CO_2, CH_4, N_2O, CFCs, and CO. In addition we will discuss the current outlook for future emissions of these gases and the current understanding of the technical potential and economic costs of options to reduce emissions of these gases. This suite of gases includes both the greenhouse gases as well as those gases which can either directly or indirectly affect the Earth's energy balance. 65 refs., 6 tabs.

7565 (WHC-EP–0536) **Quality Assurance Program Plan for radionuclide airborne emissions monitoring.** Vance, L.W. Westinghouse Hanford Co., Richland, WA (United States). Dec

1991. 139p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-87RL10930. Order Number DE92005280. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Program Plan (QAPP) describes how the Environmental, Safety, Health, and Quality Assurance Division verifies that radioactive airborne emission measurement activities from regulated stacks are controlled at the Hanford Site. Detailed monitoring requirements apply to stacks exceeding 1% of the standard of 10 mrem annual effective dose equivalent to the maximally exposed individual from operations of the Hanford Site.

7566 (ANL/CP-73172) **Ultrasonic process for detoxification of groundwater.** Wu, Jiann M.; Huang, H.S.; Livengood, C.D. Argonne National Lab., IL (United States). [1991]. 33p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract W-31109-ENG-38. (CONF-911133–8: American Institute of Chemical Engineers (AIChE) annual meeting, Los Angeles, CA (United States), 17-22 Nov 1991). Order Number DE92004142. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, we present the results of an investigation of the ultrasonic irradiation of carbon tetrachloride at various pH values, temperatures, and power intensities. Kinetic data and selected chemical mechanism are discussed and proposed. To study oxidant efficiency, chemical oxidants, such as hydrogen peroxide, are also considered. This work is part of a project entitled "Ultrasonic Process for Detoxification of Groundwater and Soil," sponsored by the US Department of Energy, Office of Technology Development, to develop an innovative process for the effective destruction of chlorinated organics in soil and groundwater.

7567 (CNIC–00413) **The migration, accumulation and distribution of ^{59}Fe in rice plants and soils.** Wang Yumin (Chinese Academy of Agricultural Sciences, Beijing, BJ (China). Inst. for Application of Atomic Energy); Xu Shiming; Xu Guanren. China Nuclear Information Centre, Beijing, BJ (China). Jul 1990. 15p. (In Chinese). (CSNAS–0032.). Order Number DE92613453. Source: OSTI; NTIS (US Sales Only); INIS.

The ^{59}Fe is one of radionuclides in the waste water discharged from nuclear power plants. The accumulation and distribution of ^{59}Fe in rice plants at different growing stages and the accumulation and migration in soils of different textures were studied by using solution containing $^{59}FeCl_3$ as a tracer. At the same contaminated activity, the distribution in the soils are discussed. According to the biological consequences caused by ^{59}Fe entering indirectly into agroecological environment, the possible methods for treatment and utilization of agricultural products are suggested.

7568 (CNIC–00419) **Natural radionuclides in phosphatic fertilizer and their behaviour of absoption and accumulation in soils and crops.** Chen Jingjian (Chinese Academy of Agricultural Sciences, Beijing, BJ (China). Inst. of Application of Atomic Energy); Zhu Yongyi; Yang Juncheng; Gu Baming. China Nuclear Information Centre, Beijing, BJ (China). Jun 1990. 16p. (In Chinese). (CSNAS–0033.). Order Number DE92613454. Source: OSTI; NTIS (US Sales Only); INIS.

The systematic data on the radioactivity of U, Th, Ra and ^{40}K in phosphate rocks, phosphatic fertilizers and soil are given. The radioactive composition and radioactivity in phosphatic fertilizers vary with different kinds of phosphatic fertilizers. The radioactive compositions in the phosphatic fertilizers made from phosphate rock are the same as that in the original phosphate rock, but the radioactivity is only 50$\approx$60% of the original. The natural uranium in the compound fertilizer made from phosphoric acid is several times higher than that in the phosphate rock, and the other radionuclides were separated during the process of forming phosphoric acid. In soil, the radioactivity varies with the soil types. The U content is slightly higher in the south region with red earth and the ^{40}K is higher in the north region with black earth, but all are in normal level. Usually, the radioactivity of phosphate rock and phosphatic fertilizer is between the natural background of soil and the limitation of radioactive protection, but the radioactivity of ^{226}Ra in some phosphate rocks and phosphatic fertilizers in Guizhou and Hunan is higher than the permitted limitation set by the government.

7569 (CONF-9106315–1) **The influence of surfactant sorption on capillary pressure-saturation relationships.** Desai, F.N.; Demond, A.H.; Hayes, K.F. Michigan Univ., Ann Arbor, MI (United States). Dept. of Civil and Environmental Engineering. [1991]. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER60820. From 65. annual colloid and surface science symposium; Norman, OK (United States); 17-19 Jun 1991. Order Number DE92004336. Source: OSTI; NTIS; GPO Dep.

The capillary pressure-saturation relationship, a fundamental relationship in the description of multiphase flow, depends on the interfacial properties of the system. Sorption of a cationic surfactant such as cetyltrimethylammonium bromide (CTAB) at the various interfaces of a system changes interfacial properties such as electrophoretic mobility, interfacial tensions, and contact angle. The objective of this paper is to examine the effect of the changes in these interfacial properties on the capillary pressure-saturation relationships for the air-water-silica system. The results presented here show that as the sorption of CTAB increases, the naturally negatively-charged silica surface becomes positively charged. This change in charge is reflected in the contact angle which passes through a maximum when the electrophoretic mobility is close to zero. The spontaneous imbibition capillary pressure relationship is more sensitive to changes in interfacial properties than the drainage relationship. In the air-water-silica system studied here, no imbibition is observed at the maximum contact angle. The surface tension and contact angle can be used to predict both the drainage and imbibition relationships of the air-water-silica-CTAB systems from that of the air-water-silica system. The prediction is accomplished through scaling using the value of surface tension and the operational contact angle, which can be obtained from the intrinsic angle through the incorporation of corrections for roughness and interfacial curvature. A comparison of the measured and calculated capillary pressure relationships shows that it is possible to predict the effect of surfactant sorption on both drainage and imbibition capillary pressure-saturation relationships for the system studied.

7570 (CONF-9109234–7) **Use of electromagnetic borehole flowmeter to delineate groundwater producing fractures.** Nyquist, J.E. (Oak Ridge National Lab., TN (United States)); Moore, G.K.; Clapp, R.B.; Young, S.C. Oak Ridge National Lab., TN (United States). [1991]. 5p. Sponsored by U.S. DOE Office of Environmental Restoration and Waste Management. DOE Contract AC05-84OR21400. From 4. Tennessee water resources symposium; Knoxville, TN (United States); 24-26 Sep 1991. Order Number DE92003559. Source: OSTI; NTIS; GPO Dep.

Ground water flow on the Oak Ridge Reservation (ORR) is dominated by permeable fractures within the relatively impermeable rocks. It is possible to detect the fractures which intersect a borehole using conventional logging tools (electrical, sonic, acoustic televiewer, caliper, temperature), but not with any certainty which of these fractures are permeable and are part of a connected network. This poses a problem for the groundwater modeler. Should all known fractures be included in the model? Only major fractures?

7571 (CONF-9111158–1) **Supercritical fluid extraction and organic solvent microextraction of chemical agent simulants from soil.** Griest, W.H.; Ramsey, R.S.; Ho, C.h.; Caldwell, W.M. Oak Ridge National Lab., TN (United States). [1991]. 8p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. Contract IAG 1989-C110-A1. From 1991 U.S. Army chemical research conference on chemical defense; Aberdeen Proving Ground, MD (United States); 19-22 Nov 1991. Order Number DE92004442. Source: OSTI; NTIS; GPO Dep.

Experiments with chemical warfare agent simulants suggest that supercritical fluid extraction can achieve good extraction recoveries of agents in soil and produce less laboratory waste than current organic solvent extraction methods. Two-ppm spikes in 1 g of Rocky Mountain Arsenal Standard Soil were extracted using 5% methanol in carbon dioxide at 300 atm for 2 min at 60°C. Recoveries (n=3) were 79±23% for dimethylmethylphosphonate, 93±14% for 2-chlorethylethylsulfide, 92±13% for diisopropylfluorophosphate, and 95±17% for diisopropylmethylphosphonate. A 5 min ultrasonic micro-scale extraction using methanol is more reproducible but less efficient.

7572 (DOE/ER/60820–2) **The influence of interfacial properties on two-phase liquid flow of organic contaminants in groundwater: Progress report, January 1, 1991–September 31, 1991.** Hayes, K.F.; Demond, A.H. Michigan Univ., Ann Arbor, MI (United States). Sep 1991. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER60820. Order Number DE92004685. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this project is to investigate how changes in interfacial chemical properties affect two-phase transport relationships. Specifically, the objective is to develop a quantitative means that will enable the prediction of changes in the capillary pressure-saturation relationship, a fundamental constitutive relationship in multiphase flow, from changes in interfacial properties, such as adsorption and electrophoretic mobility, through a knowledge of their effect on wettability. The information presented here summarizes the progress we have made in the past eight months of the second project period. Working with a system composed of air-water-silica-cetyltrimethylammonium bromide (CTAB), we have obtained a relationship between degree of adsorption and the surface charge of silica (as measured by electrophoretic mobility), and the drainage and imbibition capillary pressure relationships of system. The bulk of this report describes the completed set of measurements for the air-water-silica-CTAB system at pH 6. We are currently working on a comparable set of measurements for the xylene-water-silica-CTAB system at pH 6. Described here are the interfacial tension, contact angle and preliminary drainage capillary pressure measurements. Our work to date shows a dependence of surface properties on pH. Consequently, in the coming year, we will also complete a set of measurements at another pH value to show the effect of pH on capillary pressure relationships.

7573 (DOE/ER/60845–2) **Adsorption of chromate/organic-acid mixtures in aquifer materials: Technical progress report, 1 July 1990–30 June 1991.** Fish, W.; Palmer, C.D. Oregon Graduate Inst. of Science and Technology, Beaverton, OR (United States). Dept. of Environmental Science and Engineering. 15 Jul 1991. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-89ER60845. Order Number DE92004390. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to develop a fuller understanding of the interactions of mixtures of anionic co-contaminants with oxide-mineral surfaces. Our specific focus is on the competitive interactions of chromate and oxalic acid on ferric oxyhydroxide and on natural aquifer materials. Chromate and oxalate are of practical interest as widespread contaminants at many DOE facilities. However, these anions also are excellent model adsorbates for elucidating fundamental aspects of ionic adsorption processes, particularly with respect to organic acids.

7574 (DOE/ER/60946–2) **Reductive mobilization of oxide-bound metals: Progress report, November 1, 1990–September 15, 1991.** Stone, A.T. Johns Hopkins Univ., Baltimore, MD (United States). Dept. of Geography and Environmental Engineering. [1991]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-90ER60946. Order Number DE92004040. Source: OSTI; NTIS; GPO Dep.

We have completed a large number of experiments which examine the release of MnO_2-bound Co, Ni, and Cu. Our work has focused upon the following areas: (1) competitive adsorption among the three toxic metals and Mn(II); (2) toxic metal release upon addition of low MW organic reductants and complexants; and (3) toxic metal release upon addition of natural organic matter-rich surface waters and IHSS organic matter reference material.

7575 (DOE/OR/00033–T456) **Screening assessment from potential exposure to ^{137}Cs, ^{60}Co and ^{90}Sr in the upper floodplain of White Oak Lake.** Ghiron, J.A. Florida Univ., Gainesville, FL (United States). 1991. 106p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-76OR00033. Order Number DE92004764. Source: OSTI; NTIS; INIS; GPO Dep.

In 1943, Oak Ridge National Laboratory formed White Oak Lake, a small shallow retention basin for their treated and untreated liquid waste. The waste flowed into White Oak Lake, where it was retained for a period of time, and most of the radioactive contaminants settled out, accumulating in the lake bed. Currently, the lake is being maintained at a lower level than in the past. Consequently, sections of the old lake bed are presently exposed as an upper floodplain. A preliminary screening assessment was performed on the upper floodplain of White Oak Lake to identify the radionuclides of concern, quantify the potential risk to human health, and rank potential contaminants of concern. From the screening criteria applied in this assessment, ^{137}Cs in the external pathway and in the ingestion pathway was identified as a high priority contaminant. The external and ingestion pathways were identified as pathways of concern that need to be addressed in further investigations. Screening did not identify the inhalation pathway as a potential pathway of concern. It is recommended that when the health risk assessment is conducted, emphasis should be placed on investigating the potential exposures from ^{137}Cs in the external and ingestion pathways.

7576 (DOE/OR/00033–T457) **Hazard ranking systems for chemical wastes and chemical waste sites: Hazardous waste ranking systems.** Waters, R.D. (Vanderbilt Univ., Nashville, TN (United States)); Parker, F.L.; Crutcher, M.R. Vanderbilt Univ., Nashville, TN (United States). [1991]. 78p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-76OR00033. Order Number DE92004765. Source: OSTI; NTIS; INIS; GPO Dep.

Hazardous materials and substances have always existed in the environment. Mankind has evolved to live with some degree of exposure to toxic materials. Until recently the risk has been from natural toxins or natural background radiation. While rapid technological advances over the past few decades have improved the lifestyle of our society, they have also dramatically increased the availability, volume and types of synthetic and natural hazardous materials. Many of their effects are as yet uncertain. Products and manufacturing by-products that no longer serve a useful purpose are deemed wastes. For some waste products land disposal will always be their ultimate fate. Hazardous substances are often included in the waste products. One needs to classify wastes by degree of hazard (risk). Risk (degree of probability of loss) is usually defined for risk assessment as probability of an occurrence times the consequences of the occurrence. Perhaps even more important than the definition of risk is the choice of a risk management strategy. The choice of strategy will be strongly influenced by the decision criteria used. Those decision criteria could be utility (the greatest happiness of the greatest number), rights or technology based or some combination of the three. It is necessary to make such choices about the definition of risks and criteria for management. It is clear that these are social (i.e., political) and value choices and science has little to say on this matter. This is another example of what Alvin Weinberg has named Transcience where the subject matter is scientific and technical but the choices are social, political and moral. This paper shall deal only with the scientific and technical aspects of the hazardous waste problem to create a hazardous substances classification system.

7577 (DOE/OR/21548–194) **Quarry residuals RI/FS scoping document: Weldon Spring Site Remedial Action Project.** MK-Ferguson Co., St. Charles, MO (United States); Jacobs Engineering Group, Inc., St. Charles, MO (United States). Oct 1991. 57p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-86OR21548. Order Number DE92001850. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to serve as a planning tool for the implementation of the Quarry Residual Remedial Investigation/Feasibility Study (RI/FS) process and to provide direct input to revising and updating the 1988 Work Plan for the Weldon Spring Site Remedial Action Project (WSSRAP) Remedial Investigation/Feasibility Study-Environmental Impact Statement for the Weldon Spring Site (RI/FS-EIS) (Peterson et al. 1988) for this effort. The scoping process is intended to outline the tasks necessary to develop and implement activities in compliance with the Comprehensive Environmental Response, Compensation and Liability Act-National Environmental Policy Act (CERCLA-NEPA) process from detailed planning through the appropriate decision document. In addition to scoping the entire process, this document will serve as the primary tool for planning and accomplishing all activities to be developed in the Quarry Residual RI/FS Work Plan. Subsequent tasks are difficult to plan at this time. 10 refs., 5 figs., 5 tabs.

7578 (EGG–10617-1080) **An aerial radiological survey of the West Valley Demonstration Project and surrounding area, West Valley, New York: Date of survey, August–September 1984.** Berry, H.A. EG and G, Inc., Las Vegas, NV (United States). Remote Sensing Lab. Sep 1991. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-88NV10617. Order Number DE92003606. Source: OSTI; NTIS; INIS; GPO Dep.

An aerial radiological survey of the West Valley Demonstration Project and the surrounding area was conducted from mid-August through early September 1984 by EG&G Energy Measurements, Inc. for the United States Department of Energy. The radiological survey was part of the United States Department of Energy Comprehensive Integrated Remote Sensing (CIRS) program, which provides state-of-the-art remote sensing to support the needs of the various DOE facilities. The survey consisted of airborne measurements of both natural and man-made gamma radiation emanating from the terrestrial surface. These measurements allowed an estimate of the distribution of isotopic concentrations in the area surrounding the project site. Results are reported as isopleths superimposed on aerial photographs of the area. Gamma ray energy spectra are also presented for the net man-made radionuclides. 8 refs., 16 figs., 9 tabs.

7579 (EGG–10617-1132) **An aerial radiological survey of the Saxton Nuclear Experimental Corporation facility and surrounding area, Saxton, Pennsylvania: Date of survey: July 1989.** Hoover, R.A. EG and G Energy Measurements, Inc., Las Vegas, NV (United States). Remote Sensing Lab. Oct 1991. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-88NV10617. Order Number DE92004702. Source: OSTI; NTIS; INIS; GPO Dep.

An aerial radiological survey was conducted during the period July 5 to 22, 1989, over an 83-square kilometer (32-square-mile) area surrounding the Saxton Nuclear Experimental Corporation (SNEC) facility which is owned by General Public Utilities and located near Saxton, Pennsylvania. The survey was conducted at a nominal altitude of 61 meters (200 feet) with line spacings of 91 meters (300 feet). A contour map of the terrestrial gamma exposure rate extrapolated to 1 meter above ground level (AGL) was prepared and overlaid on an aerial photograph and a set of United States Geological Survey (USGS) topographic maps of the area. The terrestrial exposure rates varied from about 9 to 11 microroentgens per hour (μR/h) over most of the survey area. The levels over the SNEC family did not differ from the exposure rates seen over the entire survey area. Cesium-137 (Cs-137) levels typical of worldwide fallout deposition were detected throughout the surveyed area. No other trends of Cs-137 were observed. Soil samples and pressurized ion chamber measurements were obtained at six locations within the survey boundaries to support the aerial data.

7580 (ETDE-IT–91-83) **Determination of experimental parameters for evaluating release of contaminants and their interaction with environment at waste disposal site.** Balzamo, S.; De Angelis, G.; Marchetti, A. ENEA, Casaccia (Italy). Centro Ricerche Energia. May 1991. 12p. (CONF-910508–2: Joint international symposium on the environmental consequences of different waste disposal, Stockholm (Sweden), 27-31 May 1991). Order Number DE92744000. Source: OSTI; NTIS (US Sales Only).

From Joint international symposium on environmental consequences of hazardous waste disposal; Stockholm, Sweden (27-31 May 1991).

A research programme has been undertaken at ENEA with the financial support of the Ministry for the Environment in the aim at evaluating the environmental impact of hazardous waste disposal. Experimental tests have been carried out in order to obtain a series of data on which models for the prediction of future contamination are based, in the frame of such programme. The release of toxic elements from solidified wastes, as well as the release mechanisms, were evaluated. The interaction between conditioned wastes and soil was assessed in labo. scale with the help of lysimeters using siliceous sand or natural pozzolan as simultants of ground soil. Moreover, the relative mobility of different cations travelling through the soil was determined by measuring the linear distribution coefficient. Finally the permeabilities of both conditioned waste and backfill material were taken into account and related to each other. Due to the strict relationship existing between water permeability and cement capillary pores, measurements of cement porosity by mercury intrusion porosimetry were also performed.

7581 (GSF–41/90) **Radioactivity levels of trees before and after the Chernobyl reactor accident as well as in vitro determinations of cesium to evaluate leaf uptake and deep zone distribution in adaxial leaf cuticles.** Ertel, J. (GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Strahlenschutz). GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Dec 1990. 203p. (In German). Order Number DE92750155. Source: OSTI; NTIS (US Sales Only); INIS.

It was the aim of the study described here to investigate into radionuclide concentrations in various species of trees encountered in forests that are detectable over prolonged periods of time after the Chernobyl accident. Separate radionuclide measurements for the individual tree organs (leaves, needles and branches of different ages, wood, fruit and semen) permitted conclusions to be drawn as to the fate of the isotopes under investigation. A survey is given of the distribution of invading radionuclides, changes over time and their migration into newly grown parts of trees. The findings are evaluated in the context of measurements made in comparable samples obtained before the Chernobyl accident. (orig.).

7582 (IAEA-R–5060-F) **Natural production long-lived radionuclides in geological formations: Final report for the period 15 April 1988 - 31 August 1991.** Florkowski, T. International Atomic Energy Agency, Vienna (Austria). Sep 1991. 33p. Order Number DE92613458. Source: OSTI; NTIS (US Sales Only); INIS.

The natural production of radionuclides in the geosphere is of importance in studies of the residence time of old groundwater as well as in the determination of the migration rates of long-lived radio-nuclides from underground disposal sites of radioactive waste. Estimation of production rates of radionuclides originating in the spontaneous fission of uranium (e.g. ^{81}Kr, ^{129}I, ^{99}Tc), or in reactions with thermal neutrons (e.g. ^{36}Cl), has been described in a number of publications. The method of determining the neutron energy spectrum in various types of rock and the calculation of production rates and equilibrium concentrations of certain radionuclides are known for some elements. Estimation of the production of nuclides in nuclear reactions with fast neutrons in the rock formation is possible when the neutron energy distribution is known. One of the best possible approaches to this question is by application of a multigroup diffusion approximation. The main limitation of this estimation is the necessary assumption of the homogeneity of the distribution of all elements in the rock matrix. The mineralogical structure of the rock, as well as the fact that uranium and thorium-rich minerals are often concentrated close to the fracture zones and microfissures, plays an important role in the mechanism of neutron production yields and possibly in the production of ^{239}Pu. Nevertheless, even this simplified approach is helpful in estimating the production rates of interesting nuclides. Refs, figs and tabs.

7583 (JAERI-M–91-118) **Experimental method for determining distribution coefficients of TRU nuclides for evaluating their migration behaviors.** Tanaka, Tadao (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Kamiyama, Hideo. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1991. 19p. (In Japanese). Order Number DE92750952. Source: OSTI; NTIS (US Sales Only); INIS.

Distribution coefficients of americium and plutonium were measured by batch experiments for typical geological formations at Shimokita area in Aomori prefecture, sand stone, tuff rock and sandy soil. The distribution coefficients of both nuclides were largely affected by pH of the used synthetic ground water as well as by the separating condition of solid-liquid phase. It has been shown that their distribution coefficients are varied by their transfer route among geological formations, since their chemical species, which can move through a certain geological formation, are depending on its pore size and the pH of infiltrating water in it. It was concluded that consideration on the structure of geological formations and their physico-chemical properties should be taken in the measurement of effective distribution coefficients for evaluating the migration behavior of TRU nuclides. (author).

7584 (KAERI-II/RR–5/90) **Evaluation of structural behavior, geological and hydrogeological characteristics: A dynamic behavior study of rock caverns considering the effects of discontinuities.** Kim, Jhin Wung (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Sun Hoon; Choi, Kyu Sup; Lee, Kyung Jin; Kim, Dae Hong. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1991. 107p. (In Korean). Order Number DE92614882. Source: OSTI; NTIS (US Sales Only); INIS.

The structural behavior of radioactive waste disposal facilities may be greatly influenced by earthquakes through ground shaking and earthquake-induced ground evaluation of radioactive waste repositories. Therefore, a comprehensive understanding of computational models considering the effects of discontinuities and an improvement of structural analysis methods are essential in order to predict properly the dynamic behavior of underground rock caverns subjected to seismic loadings. The purpose of this study is to examine the structural behavior of rock cavern within discontinuous rock masses subjected to dynamic loadings with the objective that the results of this study will become a basis for understanding the effects of ground motion associated with earthquakes on underground radioactive waste disposal facilities. This report is divided into three parts. In the first part, computational models for discontinuous rock masses and equations of motion for a rigid block model are discussed. In the second part, the distinct element program written for the static and dynamic analysis of discontinuous rock masses is presented. A few practical examples of structural analyses of rock caverns within discontinuous rock masses subjected to dynamic loadings using the distinct element computer program are presented in the third part of this report. (Author).

7585 (KFK–4906) **Estimation of the temperature structure parameter and the sensible heat flux from SODAR measurements.** Gentou, H.; Kalthoff, N.; Thomas, P.; Vogt, S. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Meteorologie und Klimaforschung. Aug 1991. 32p. Order Number DE92759286. Source: OSTI; NTIS (US Sales Only).

A commercially available Doppler-SODAR and a sonic anemometer-thermometer have been operated during June and July 1990 at the Nuclear Research Center Karlsruhe to mesure backscattered echo, the wind vector, the standard deviation of the vertical wind speed and sonic data like the heat flux. Other meteorological parameters have additionally been measured by the SODAR, the sonic instrument at 100 m AGL, and at a 200 m high tower at which the sonic instrument was installed. Temperature structure parameters derived from SODAR backscattering echo and from sonic anemometer-thermometer data using mixed layer similarity relationship are compared and show fairly good correlation. Measurements of the SODAR backscattered echo and standard deviation of the vertical wind speed are each used to estimate the sensible heat flux in the convective Planetary Boundary Layer. Comparison with simultaneous point measurement by the eddy correlation method shows good agreement between the two instruments. (orig.).

7586 (ORNL/M–1157) **Environmental surveillance data report for the fourth quarter of 1990.** Goldberg, P.Y.; Horwedel, B.M.; Loffman, R.S.; Osborne-Lee, A.E.; Powell, M.R.; Stevens, M.M.; Tardiff, M.F.; Valentine, C.K.; Wolf, D.A. Oak Ridge National Lab., TN (United States). Jan 1992. 129p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92005089. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Surveillance and Protection Section within the Office of Environmental and Health Protection at the Oak Ridge National Laboratory (ORNL) is responsible for the development and implementation of an environmental program to (1) ensure compliance with all federal, state, and Department of Energy (DOE) reporting requirements to quantitatively demonstrate prevention, control, and abatement of environmental pollution; (2) monitor the adequacy of containment and effluent controls; and (3) assess impacts of releases from ORNL facilities on the environment. Environmental monitoring, as defined by Draft DOE Order 5400.6, consists of two major activities: effluent monitoring and environmental surveillance. Effluent monitoring is the collection and analysis of sample or measurements of liquid and gaseous effluents. Environmental surveillance is the collection and analysis of samples, or direct measurements, of air, water, soil, foodstuff, biota, and other media from DOE sites and their environs. Monthly or quarterly summaries are presented in this report for each media sampled. All data are rounded to two significant digits. The summary tables generally give the number of samples collected during the period and the maximum, minimum, average, and standard error of the mean (SE) values of parameters for which determinations were made.

7587 (ORNL/TM–11883/R1) **PCB annual report for Oak Ridge National Laboratory EPA Identification Number - TN 1890090003, February 6, 1990–December 31, 1990.** Greer, J.K. Jr.; Foley, R.C. Oak Ridge National Lab., TN (United States). 15 Oct 1991. 139p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE92005306. Source: OSTI; NTIS; GPO Dep.

Oak Ridge National Laboratory prepares a report annually as mandated by the Toxic Substances Control Act (TSCA) that summarizes records required of owners/operators of facilities where PCBs are in use. This report provides information of PCB and PCB-contaminated equipment in use or removed from service and PCB wastes generated, stored, and shipped off-site for treatment and disposal during the time period February 6, 1990, through December 31, 1990, as required by the revised TSCA regulations described in the December 21, 1989, Federal Register (54 FR 52716).

7588 **Method of separating organic contaminants from fluid feedstreams with polyphosphazene membranes.** McCaffrey, R.R.; Cummings, D.G. To Dept. of Energy. 1990. Filed date 30 Apr 1990. USA Patent application 7-516,400. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE92004607. Source: OSTI; NTIS; GPO Dep.

A method is provided for separating polar hydrocarbons from a fluid feedstream. The fluid feedstream is flowed across a first surface of a polyphosphazene semipermeable membrane. At least one polar hydrocarbon from the fluid feedstream permeates through the polyphosphazene semipermeable membrane to a second opposed surface of the semipermeable membrane. Then the permeated polar hydrocarbon is removed from the second opposed surface of the polyphosphazene semipermeable membrane. Outstanding and unexpected separation selectivities on the order of 10,000 were obtained for methylene chloride when a methylene chloride in water feedstream was flowed across the polyphosphazene semipermeable membrane in the invented method.

7589 (PNL–7927) **Ecological survey of M-Field, Edgewood Area Aberdeen Proving Ground, Maryland.** Downs, J.L.; Eberhardt, L.E.; Fitzner, R.E.; Rogers, L.E. Pacific Northwest Lab., Richland, WA (United States). Dec 1991. 60p. Sponsored by U.S. Department of Defense. DOE Contract AC06-76RL01830. Order Number DE92005174. Source: OSTI; NTIS; GPO Dep.

For U.S. Army Aberdeen Proving Ground, Maryland.

An ecological survey was conducted on M-Field, at the Edgewood Area, Aberdeen Proving Ground, Maryland. M-Field is used routinely to test army smokes and obscurants, including brass flakes, carbon fibers, and fog oils. The field has been used for testing purposes for the past 40 years, but little documented history is available. Under current environmental regulations, the test field must be assessed periodically to document the presence or potential use of the area by threatened and endangered species. The M-Field area is approximately 370 acres and is part of the US Army's Edgewood Area at Aberdeen Proving Ground in Harford County, Maryland. The grass-covered field is primarily lowlands with elevations from about 1.0 to 8 m above sea level, and several buildings and structures are present on the field. The ecological assessment of M-Field was conducted in three stages, beginning with a preliminary site visit in May to assess sampling requirements. Two field site visits were made June 3–7, and August 12–15, 1991, to identify the biota existing on the site. Data were gathered on vegetation, small mammals, invertebrates, birds, large mammals, amphibians, and reptiles.

7590 (PNL-SA–19779) **Expert reasoning within an object-oriented framework.** Bohn, S.J.; Pennock, K.A. Pacific Northwest Lab., Richland, WA (United States). Oct 1991. 7p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-9110269–1: Northcon 1991, Portland, OR (United States), 1-3 Oct 1991). Order Number DE92002142. Source: OSTI; NTIS; INIS; GPO Dep.

A large number of contaminated waste sites across the United States await site remediation efforts. These sites can be physically complex, composed of multiple, possibly interacting, contaminants distributed throughout one or more media. The Remedial Action Assessment System (RAAS) is being designed and developed to support decisions concerning the selection of remediation alternatives. The goal of this system is to broaden the consideration of remediation alternatives, while reducing the time and cost of making these considerations. The Remedial Action Assessment System was designed and constructed using object-oriented techniques. It is a hybrid system which uses a combination of quantitative and qualitative reasoning to consider and suggest remediation alternatives. the reasoning process that drives this application is centered around an object-oriented organization of remediation technology information. This paper briefly describes the waste remediation problem and then discusses the information structure and organization RAAS utilizes to address it. 4 refs., 4 figs.

7591 (POEF/ER/Sub–88/4523) **Well 6B remediation X-608B Well Field interim measures plan.** Portsmouth Gaseous Diffusion Plant, OH (United States); Geraghty and Miller, Inc., Dublin, OH (United States). Environmental Services. Jul 1991. 49p. Sponsored by U.S. DOE Environment Safety & Health. DOE Contract AC05-76OR00001. Order Number DE92002247. Source: OSTI; NTIS; GPO Dep.

On March 1, 1989, during routine maintenance on the Well 6B pump, approximately 264 milliliters of mercury was spilled into the water column of Well 6B, X-608 Wellfield. In addition, eight gallons of mineral oil were spilled and parts of the pump were lost down the well. This report discusses attempts to remediate the well and recommendations for future work. (JL)

7592 (PSI–103) **A physico-chemical characterisation technique for determining the pore-water chemistry in argillaceous rocks.** Baeyens, B. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Bradbury, M.H. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1991. 67p. Order Number DE92613488. Source: OSTI; NTIS (US Sales Only); INIS.

A prerequisite for carrying out credible sorption studies is the definition of an aqueous phase composition which is in equilibrium with the solid phase. Experimental methods and data analysis procedures are described which enable an equilibrium water composition to be produced for argillaceous rocks which is not dependent on liquid to solid (L:S) ratios. Since a Valanginian marl formation is under consideration by Nagra as a potential rock for the disposal of low and short-lived medium level radioactive waste in Switzerland, samples of this material were chosen for this investigation. Aqueous phase and nickel ethylenediamine extraction experiments were carried out at different L:S ratios under controlled atmosphere conditions (P_{CO_2}=10^{-2} bar, $O_2 \leq$ 5 ppm). The results from these tests and petrographical examinations were combined to define the system in terms of the physico-chemical characteristics of the clay mineral component (CEC and cation occupancies) and the identities of highly soluble and solubility limited phases in the marl. The geochemical code PHREEQE was used in conjunction with the Gapon equations to calculate the pore water composition. This work clearly showed that pore water chemistries obtained from aqueous extracts alone may lead to an arbitrary water chemistry in argillaceous rock systems, particularly with respect to ionic composition and ionic strength, which may have important consequences for radionuclide speciation and sorption studies. (author) 11 figs., 12 tabs., 25 refs.

7593 (PSI–105) **INTRAVAL test case 1b - modelling results.** Jakob, A. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Hadermann, J. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Jul 1991. 39p. Order Number DE92613460. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents results obtained within Phase I of the INTRAVAL study. Six models are fitted to the results of four infiltration experiments with ^{233}U tracer on small samples of crystalline bore cores originating from deep drillings in Northern Switzerland. Four of these are dual porosity media models taking into account advection and dispersion in water conducting zones (either tubelike veins or planar fractures), matrix diffusion out of these into pores of the solid phase, and either non-linear or linear sorption of the tracer onto inner surfaces. The remaining two are equivalent porous media models (excluding matrix diffusion) including either non-linear sorption onto surfaces of a single fissure family or linear sorption onto surfaces of several different fissure families. The fits to the experimental data have been carried out by Marquardt-Levenberg procedure yielding error estimates of the parameters, correlation coefficients and also, as a measure for the goodness of the fits, the minimum values of the χ^2 merit function. The effects of different upstream boundary conditions are demonstrated and the penetration depth for matrix diffusion is discussed briefly for both alternative flow path scenarios. The calculations show that the dual porosity media models are significantly more appropriate to the experimental data than the single porosity media concepts. Moreover, it is matrix diffusion rather than the non-linearity of the sorption isotherm which is responsible for the tailing part of the breakthrough curves. The extracted parameter values for some models for both the linear and non-linear (Freundlich) sorption isotherms are consistent with the results of independent static batch sorption experiments. From the fits, it is generally not possible to discriminate between the two alternative flow path geometries. On the basis of the modelling results, some proposals for further experiments are presented. (author)

7594 (PSI–106) **A simple transport model for the Grimsel migration experiments.** Herzog, F. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1991. 58p. Order Number DE92613461. Source: OSTI; NTIS (US Sales Only); INIS.

To understand the results of the field migration experiments of NAGRA at the Grimsel Test Site (Central Switzerland), it is necessary to develop models (hydraulic as well as transport models). In this paper a simple approach with streamtubes is described which allows to model the hydraulic situation for asymmetric dipole arrangements and transport along streamlines, including sorption and diffusion into fracture infill material. The model is confronted with two experiments, one with a nonsorbing tracer (uranine) and the other with sorbing (^{24}Na) and nonsorbing tracer material. The fit-by-eye parameter values are compatible with those from batch experiments. The sensitivity of breakthrough curves on the chosen parameters was checked with a parameter variation study. In the range of considered variations the breakthrough curves of nonsorbing tracers are not sensitive to matrix properties because saturation is achieved in all cases considered. For sorbing tracers the situation is more complicated as saturation may be achieved or not within the experimental timescale; due to this fact, it is emphasized, that step input experiments should be performed instead of pulse test experiments. (author) 17 figs., 4 tabs., 10 refs.

7595 (SAND–86-7006) **An evaluation of the seismicity of the Nevada Test Site and vicinity: Yucca Mountain Site Characterization Project.** Vortman, L.J. Sandia National Labs., Albuquerque, NM (United States). Dec 1991. 237p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC04-76DP00789. Order Number DE92004787. Source: OSTI; NTIS; INIS; GPO Dep.

Two USGS catalogs of earthquakes in the Southern Great Basin were edited to remove man-made seisms. Editing reduced 11,988 entries to 8,161. Known location of underground nuclear explosions provided an opportunity to assess location accuracy showing that accuracy differed according to the source of earthquake data. No evidence was found of explosions triggering earthquakes distant from the working points. Relationships are developed between earthquake magnitude and explosion yield for explosions at Pahute Mesa and Yucca Flat. Comparison of the number of underground nuclear explosions with the number of earthquakes of comparable magnitude shows the former exceeds the latter when magnitude is greater than four. Edited catalogs are recommended for hazard analysis relative to repository siting because unedited catalogs tend to greatly exaggerate seismicity of the region.

7596 (SAND–91-0430) **Modeling mineral dissolution and precipitation in dual-porosity systems.** Novak, C.F.; Gelbard, F. Sandia National Labs., Albuquerque, NM (United States). Oct 1991. 51p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-9110152–2: 3. international conference on chemistry and migration behavior of actinides and fission products in the geosphere, Jerez de la Frontera (Spain), 21-25 Oct 1991). Order Number DE92003945. Source: OSTI; NTIS; INIS; GPO Dep.

A dual-porosity chemical transport model is applied to saturated fractured porous media. In this model, transport through fractures is advection-dominated while transport between the matrix and the fractures is diffusion-dominated. Recent studies in the literature indicate that conservative tracers and radionuclides in these systems will be retarded by matrix diffusion in the absence of chemical reactions. This study examines systems that include chemical reactions (e.g., dissolution/precipitation and aqueous complexation) and examines changes in retardation caused by precipitation.

7597 (SKB-TR–90-14) **Geomorphological and hydrogeological features of the Pocos de Caldas caldera and the Osamu Utsumi mine and Morro do Ferro analogue study sites, Brazil: Pocos de Caldas Report No. 5.** Holmes, D.C. (British Geological Survey, Keyworth, Nottingham (United Kingdom)); Pitty, A.E.; Noy, D.J. Brazil; SKB(SE); NAGRA(CH); DOE(GB); DOE(US) collaboration. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). 1990. 68p. Order Number DE92613489. Source: OSTI; NTIS (US Sales Only); INIS.

The Osamu Utsumi mine and Morro do Ferro study sites lie within the Pocos de Caldas plateau which is roughly circular in outline with a diameter of 35 km and an area of approximately 800 km^2. Its general altitude lies between 1300 and 1600 m. The plateau is the eroded form of a caldera which was initially intruded some 80 million years ago. Geomorphologically, both sites occupy watershed areas adjacent to small streams in the centre of the plateau. The climate of the area has a market wet season from November to April and is dry the rest of the year. The streams are ephemeral in their upper reaches, tending to dry up in the dry season as they are fed by a declining base flow. In the wet season they exhibit flash flood fed by high-intensity rainfall causing overland flow. The wet season also provides recharge to the groundwater. Natural slopes are steep and the original vegetation was thin forest cover which is now restricted to the valley bottoms; usable slopes have poor quality grass cover used for cattle grazing. The plateau is a stable feature and its surface has been eroding at an average rate of 12 m per million years over a period of 50 million years. The mine geology is dominantly volcanic to subvolcanic phonolites that have been hydrothermally altered. Fracturing of the rock is extensive. Downward diffusion of oxygen in groundwaters during deep weathering has produced a distinct redox zone seen as a colour change from green/grey to brown/yellow. Morro do Ferro has a more weathered version (laterite/clay) of the same geology penetrated by magnetite breccia dykes. Whilst the area surrounding Morro do Ferro remains untouched, that around the mine has been seriously disturbed by mining activity which has penetrated the water-table. The existing mine has modified groundwater flow patterns and disturbed the movement of oxidising and reducing waters. (au) (47 refs.).

7598 (SKB-TR–90-19) **Microbiological analysis at the Osamu Utsumi mine and Morro do Ferro analogue study sites, Pocos de Caldas, Brazil: Pcos de Caldas Report No. 10.** West, J.M. (British Geological Survey, Nottingham (United Kingdom)); Vialta, A.; McKinley, I.G. Brazil; SKB(SE); NAGRA(CH); DOE(GB); DOE(US) collaboration. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). 1990. 44p. Order Number DE92613462. Source: OSTI; NTIS (US Sales Only); INIS.

The Pocos de Caldas project is a wide-ranging natural analogue study focussed on a number of areas of concern in the performance assessment of the disposal of radioactive waste. Part of the work has involved characterising microbial populations and their influence in various processes. Core material and groundwaters have been sampled for microbiological content at various depths form boreholes at the Osamu Utsumi open pit uranium mine and Morro do Ferro Th/REE ore body. Microbes were found in all samples but numbers do not appear to be related to depth. Analyses of groundwaters gave higher numbers than with solid material and demonstrated the presence of sulphur cycle bacteria. These observations have been compared with predictions of a model used in performance assessment to calculate the maximum biomass/microbial activity based on constraints set by available nutrients and energy. The main conclusions of this analysis are: 1. Low microbial activities can be supported by the energy and nutrients supplied by alteration processes at or around the redox front. The maximum annual production of approximately equal to 0.01 - 0.1 g biomass (dry)/m^2 of redox front is in reasonable agreement with observed standing populations. 2. The presence of high concentrations of sulphate reducing bacteria around the redox front indicate a complex sulphur geochemistry which may be predominantly microbially catalysed and could explain the nodular form of pitchblende concretions and the presence of secondary pyrite. 3. There is little trace element mobilisation by organic byproducts and the main role of microbes in this system is to catalyse specific redox reactions. (au).

7599 (SKB-TR–90-22) **Near-field high-temperature transport: Evidence from the genesis of the Osamu Utsumi uranium mine, Pocos de Caldas alkaline complex, Brazil: Pocos de Caldas Report No. 13.** Cathles, L.M. (Cornell Univ., Dept. of Geological Sciences, Ithaca, New York (United States)); Shea, M.E. Brazil; SKB(SE); NAGRA(CH); DOE(GB); DOE(US) collaboration. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). 1990. 60p. Order Number DE92613490. Source: OSTI; NTIS (US Sales Only); INIS.

The chemical, isotopic and mineralogical alteration which occurred during primary uranium ore deposition at the breccia pipe-hosted Osamu Utsumi mine, Pocos de Caldas, Brazil, was studied as a natural analogue for near-field radionuclide migration. Chemical and isotopic alteration models were combined with finite difference models of the convective cooling of caldera intrusives. Application of the chemical models successfully used to interpret mineralization and alteration at the Osamu Utsumi mine to the hypothetical waste repository shows that even in a worst case scenario (waste emplaced in a permeable host rock with no measures taken to inhibit flow through the repository), the amount of hydrothermal alteration in the hypothetical repository will be about 0.1% of that in the breccia pipe at the Osamu Utsumi mine. Assuming no barriers to uranium mobility, uranium precipitation above the hypothetical repository would be 0.05 ppm (rather than 50 ppm), hydrothermal alteration 0.03 wt.% (rather than 30 wt.%), etc. The analysis indicates that mineralogical alteration is extremely sensitive to thermodynamic data. Prediction of mineralogical alteration (which may be necessary to predict the migration of radionuclides other than uranium, for example) probably cannot be based directly on even very carefully collected laboratory thermodynamic data. Mineralogical complexities of the system, as well as database uncertainties, will require calibration of the thermodynamic framework against mineralogical alteration observed in the laboratory or field by procedures briefly described. (au).

7600 (SKB-TR–91-22) **Aespoe hard rock laboratory. Evaluation and conceptual modelling based on the pre-investigations 1986-1990.** Wikberg, P. (ed.); Gustafson, G.; Rhen, I.; Stanfors, R.
